
i.MX 6Dual/6Quad Applications Processor Reference Manual

Document Number: IMX6DQRM
Rev. 1, 04/2013

Contents

| Section number | Title | Page |
|----------------|-------|------|
|----------------|-------|------|

Chapter 1 Introduction

| | | |
|---------|--|-----|
| 1.1 | About This Document..... | 197 |
| 1.1.1 | Audience..... | 197 |
| 1.1.2 | Organization..... | 197 |
| 1.1.3 | Suggested Reading..... | 198 |
| 1.1.3.1 | General Information..... | 198 |
| 1.1.3.2 | Related Documentation..... | 198 |
| 1.1.4 | Conventions..... | 198 |
| 1.1.5 | Register Access..... | 200 |
| 1.1.5.1 | Register Diagram Field Access Type Legend..... | 200 |
| 1.1.5.2 | Register Macro Usage..... | 200 |
| 1.1.6 | Signal Conventions..... | 201 |
| 1.1.7 | Acronyms and Abbreviations..... | 202 |
| 1.2 | Introduction..... | 203 |
| 1.3 | Target Applications..... | 204 |
| 1.4 | Features..... | 204 |
| 1.5 | Architectural Overview..... | 208 |
| 1.5.1 | Block Diagram..... | 208 |
| 1.5.1.1 | Simplified Block Diagram..... | 208 |
| 1.5.2 | Architectural Partitioning..... | 209 |
| 1.5.3 | Endianness Support..... | 211 |
| 1.5.4 | Memory Interfaces..... | 211 |

Chapter 2 Memory Maps

| | | |
|-----|---|-----|
| 2.1 | Memory system overview..... | 213 |
| 2.2 | ARM platform memory map..... | 213 |
| 2.3 | DDR mapping to MMDC controller ports..... | 219 |

| Section number | Title | Page |
|--|--|------|
| 2.4 | DMA memory map..... | 220 |
| <p style="text-align: center;">Chapter 3 Interrupts and DMA Events</p> | | |
| 3.1 | Overview..... | 223 |
| 3.1.1 | AP interrupts..... | 223 |
| 3.2 | SDMA event mapping..... | 227 |
| <p style="text-align: center;">Chapter 4 External Signals and Pin Multiplexing</p> | | |
| 4.1 | Overview..... | 231 |
| 4.1.1 | Pin Assignments..... | 231 |
| 4.1.2 | Muxing Options..... | 307 |
| <p style="text-align: center;">Chapter 5 Fusemap</p> | | |
| 5.1 | Fusemap..... | 351 |
| 5.2 | Fusemap Description Table..... | 361 |
| <p style="text-align: center;">Chapter 6 External Memory Controllers</p> | | |
| 6.1 | Overview..... | 367 |
| 6.2 | Multi-mode DDR controller (MMDC) overview and feature summary..... | 367 |
| 6.3 | Raw NAND Flash controller overview..... | 369 |
| 6.3.1 | NAND interface features..... | 370 |
| 6.3.2 | NAND control features..... | 371 |
| 6.3.3 | Internal interface features..... | 371 |
| 6.3.4 | APBH-DMA overview..... | 371 |
| 6.3.5 | ECC-BCH features..... | 371 |
| 6.4 | EIM-PSRAM/NOR Flash controller overview..... | 372 |
| 6.4.1 | EIM features..... | 372 |
| 6.4.2 | EIM boot scenarios..... | 373 |
| 6.4.3 | EIM boot configuration..... | 373 |
| 6.4.4 | OneNAND requirements..... | 373 |

| Section number | Title | Page |
|---------------------|---|------|
| Chapter 7 | | |
| System Debug | | |
| 7.1 | Overview..... | 375 |
| 7.2 | Chip and Cortex-A9 Core Platform Debug Architecture..... | 375 |
| 7.2.1 | Debug Features..... | 376 |
| 7.2.2 | Debug System components..... | 377 |
| 7.2.2.1 | AMBA trace bus (ATB)..... | 378 |
| 7.2.2.2 | ATB replicator..... | 378 |
| 7.2.2.3 | Embedded Cross Triggering..... | 378 |
| 7.2.2.3.1 | Cross-Trigger Matrix (CTM)..... | 379 |
| 7.2.2.3.2 | Cross-Trigger Interface (CTI)..... | 380 |
| 7.2.2.4 | Debug Access Port (DAP)..... | 380 |
| 7.2.2.5 | CoreSight trace port interface (TPIU)..... | 381 |
| 7.2.3 | i.MX6Dual/6Quad-Specific SJC Features..... | 382 |
| 7.2.3.1 | JTAG Disable Mode..... | 382 |
| 7.2.3.2 | JTAG ID..... | 382 |
| 7.2.4 | System JTAG Controller - SJC..... | 383 |
| 7.2.5 | System JTAG controller main features..... | 383 |
| 7.2.6 | SCJ TAP Port..... | 383 |
| 7.2.7 | SJC main blocks..... | 383 |
| 7.3 | Smart DMA (SDMA) core..... | 384 |
| 7.3.1 | SDMA On Chip Emulation Module (OnCE) Feature Summary..... | 385 |
| 7.3.1.1 | Other SDMA Debug Functionality..... | 385 |
| 7.3.1.2 | SDMA ROM Patching..... | 386 |
| 7.4 | Miscellaneous..... | 386 |
| 7.4.1 | Clock/Reset/Power..... | 386 |
| 7.5 | Supported tools..... | 387 |

| Section number | Title | Page |
|----------------------------------|--|------|
| Chapter 8 System Boot | | |
| 8.1 | Overview..... | 389 |
| 8.2 | Boot modes..... | 390 |
| 8.2.1 | Boot mode pin settings..... | 391 |
| 8.2.2 | High level boot sequence..... | 391 |
| 8.2.3 | Boot From Fuses Mode (BOOT_MODE[1:0] = 00b)..... | 392 |
| 8.2.4 | Serial Downloader..... | 393 |
| 8.2.5 | Internal Boot Mode (BOOT_MODE[1:0] = 0b10)..... | 394 |
| 8.2.6 | Boot security settings..... | 395 |
| 8.3 | Device Configuration..... | 396 |
| 8.3.1 | Boot eFUSE Descriptions..... | 396 |
| 8.3.2 | GPIO Boot Overrides..... | 398 |
| 8.3.3 | Device Configuration Data..... | 400 |
| 8.4 | Device Initialization..... | 400 |
| 8.4.1 | Internal ROM /RAM memory map..... | 400 |
| 8.4.2 | Boot Block Activation | 401 |
| 8.4.3 | Clocks at Boot Time..... | 402 |
| 8.4.4 | Enabling MMU and Caches..... | 403 |
| 8.4.5 | Exception Handling..... | 404 |
| 8.4.6 | Interrupt Handling During Boot..... | 405 |
| 8.4.7 | Persistent Bits..... | 405 |
| 8.5 | Boot Devices (Internal Boot)..... | 406 |
| 8.5.1 | NOR Flash/OneNAND using EIM Interface..... | 406 |
| 8.5.1.1 | NOR Flash Boot Operation..... | 407 |
| 8.5.1.2 | OneNAND Flash Boot Operation..... | 407 |
| 8.5.1.3 | IOMUX Configuration for EIM Devices..... | 408 |
| 8.5.2 | NAND Flash..... | 409 |
| 8.5.2.1 | NAND eFUSE Configuration..... | 410 |

| Section number | Title | Page |
|----------------|---|------|
| 8.5.2.2 | NAND Flash Boot Flow and Boot Control Blocks (BCB)..... | 411 |
| 8.5.2.3 | Firmware Configuration Block..... | 414 |
| 8.5.2.4 | Discovered Bad Block Table..... | 416 |
| 8.5.2.5 | Bad Block Handling in the ROM..... | 417 |
| 8.5.2.6 | Toggle Mode DDR NAND Boot..... | 418 |
| 8.5.2.6.1 | GPMI and BCH Clocks Configuration..... | 418 |
| 8.5.2.6.2 | Setup DMA for DDR Transfers..... | 419 |
| 8.5.2.6.3 | Reconfigure Timing and Speed Using Values in FCB..... | 419 |
| 8.5.2.7 | Typical NAND Page Organization..... | 419 |
| 8.5.2.7.1 | BCH ECC Page Organization..... | 420 |
| 8.5.2.7.2 | Metadata..... | 421 |
| 8.5.2.8 | IOMUX Configuration for NAND..... | 421 |
| 8.5.3 | Expansion Device..... | 422 |
| 8.5.3.1 | Expansion Device eFUSE Configuration..... | 422 |
| 8.5.3.2 | MMC and eMMC Boot..... | 425 |
| 8.5.3.3 | SD, eSD and SDXC..... | 433 |
| 8.5.3.4 | IOMUX Configuration for SD/MMC..... | 433 |
| 8.5.3.5 | Redundant Boot Support for Expansion Device..... | 434 |
| 8.5.4 | Hard Disk and SSD..... | 435 |
| 8.5.4.1 | Hard Disk and SSD eFUSE Configuration..... | 436 |
| 8.5.4.2 | IOMUX and Timing Configuration for SATA..... | 436 |
| 8.5.4.3 | Redundant Boot Support for Hard Disk and SSD..... | 437 |
| 8.5.5 | Serial ROM through SPI and I2C..... | 438 |
| 8.5.5.1 | Serial ROM eFUSE Configuration..... | 439 |
| 8.5.5.2 | I2C Boot..... | 440 |
| 8.5.5.2.1 | I2C IOMUX Pin Configuration..... | 441 |
| 8.5.5.3 | ECSPI Boot..... | 441 |
| 8.5.5.3.1 | ECSPI IOMUX Pin Configuration..... | 443 |

| Section number | Title | Page |
|----------------|---------------------------------------|------|
| 8.6 | Program image..... | 444 |
| 8.6.1 | Image Vector Table and Boot Data..... | 444 |
| 8.6.1.1 | Image Vector Table Structure..... | 445 |
| 8.6.1.2 | Boot Data Structure..... | 446 |
| 8.6.2 | Device Configuration Data (DCD)..... | 446 |
| 8.6.2.1 | Write Data Command..... | 447 |
| 8.6.2.2 | Check Data Command..... | 449 |
| 8.6.2.3 | NOP Command..... | 450 |
| 8.6.2.4 | Unlock Command..... | 451 |
| 8.7 | Plugin Image..... | 451 |
| 8.8 | Serial Downloader..... | 452 |
| 8.8.1 | USB..... | 453 |
| 8.8.1.1 | USB Configuration Details..... | 454 |
| 8.8.1.2 | IOMUX Configuration for USB..... | 455 |
| 8.8.2 | Serial Download protocol..... | 455 |
| 8.8.2.1 | SDP Command..... | 455 |
| 8.8.2.1.1 | READ REGISTER..... | 456 |
| 8.8.2.1.2 | WRITE REGISTER..... | 456 |
| 8.8.2.1.3 | WRITE_FILE..... | 457 |
| 8.8.2.1.4 | ERROR_STATUS..... | 458 |
| 8.8.2.1.5 | DCD WRITE..... | 459 |
| 8.8.2.1.6 | JUMP ADDRESS..... | 460 |
| 8.9 | Recovery Devices..... | 461 |
| 8.10 | USB Low Power Boot..... | 461 |
| 8.11 | High Assurance Boot (HAB)..... | 463 |
| 8.11.1 | ROM Vector Table Addresses..... | 464 |

| Section number | Title | Page |
|----------------|---|------|
| | Chapter 9 | |
| | Multimedia | |
| 9.1 | Video Graphics Sub System..... | 465 |
| 9.1.1 | Display outputs..... | 466 |
| 9.1.2 | Video input..... | 467 |
| 9.1.3 | Synchronization Mechanisms..... | 469 |
| 9.1.3.1 | Synchronization between the VDOA and the IPU..... | 469 |
| 9.1.4 | Supported applications..... | 469 |
| 9.2 | Image Processing Unit (IPU)..... | 473 |
| 9.2.1 | IPU External Ports..... | 475 |
| 9.2.1.1 | Camera Ports..... | 476 |
| 9.2.1.2 | Display Ports..... | 477 |
| 9.2.1.2.1 | Access Modes..... | 477 |
| 9.2.1.2.2 | Synchronous Access | 477 |
| 9.2.1.2.3 | Asynchronous Access | 478 |
| 9.2.1.2.4 | Interface details..... | 478 |
| 9.2.1.2.5 | Connecting To Display Devices..... | 479 |
| 9.2.2 | Processing..... | 479 |
| 9.2.2.1 | Display Processor (DP)..... | 481 |
| 9.2.2.2 | Video de-interlacer (VDIC)..... | 481 |
| 9.2.2.3 | Image Converter (IC)..... | 482 |
| 9.2.2.4 | Image Rotator (IRT)..... | 483 |
| 9.2.3 | Automatic Procedures..... | 483 |
| 9.2.4 | Further Changes in IPUv3H vs. IPUv3M..... | 484 |
| 9.3 | LVDS Display Bridge (LDB)..... | 484 |
| 9.3.1 | LDB Overview..... | 485 |
| 9.3.2 | LDB External Ports..... | 485 |
| 9.3.3 | Input Parallel Display Ports..... | 486 |
| 9.3.3.1 | Output LVDS Ports..... | 486 |

| Section number | Title | Page |
|----------------|--|------|
| 9.4 | Video Data Order Adapter (VDOA)..... | 486 |
| 9.4.1 | VDOA Interfaces..... | 487 |
| 9.4.2 | VDOA Data Path..... | 487 |
| 9.4.2.1 | Input..... | 487 |
| 9.4.2.2 | Output..... | 487 |
| 9.4.3 | Control..... | 487 |
| 9.5 | Display Content Integrity Checker (DCIC)..... | 488 |
| 9.5.1 | DCIC Interfaces..... | 488 |
| 9.5.2 | DCIC Data Path..... | 489 |
| 9.5.3 | Configuration parameters..... | 490 |
| 9.5.4 | System Considerations..... | 490 |
| 9.6 | Video Processing Unit (VPUv6)..... | 491 |
| 9.6.1 | Basic Structure..... | 492 |
| 9.6.2 | Feature summary..... | 494 |
| 9.7 | OpenGL ES 3D Graphics Processing Unit (GPU3Dv4)..... | 494 |
| 9.7.1 | OpenGL Overview..... | 494 |
| 9.7.2 | OpenGL Features..... | 495 |
| 9.7.3 | OpenGL Block Diagram..... | 495 |
| 9.7.4 | OpenGL Performance..... | 496 |
| 9.7.5 | OpenGL Software..... | 496 |
| 9.8 | 2D Graphics Processing Unit (GPU2Dv2)..... | 496 |
| 9.8.1 | 2D feature summary..... | 496 |
| 9.8.2 | 2D Block Diagram..... | 497 |
| 9.8.3 | 2D Performance..... | 498 |
| 9.8.4 | 2D Software..... | 498 |
| 9.9 | Vector Graphics Processing Unit (GPUVGv2)..... | 498 |
| 9.9.1 | Vector Graphics Overview..... | 499 |
| 9.9.2 | Vector Graphics Features..... | 499 |
| 9.9.3 | Vector Graphics Performance..... | 500 |

| Section number | Title | Page |
|----------------|--|------|
| 9.9.4 | Vector Graphics Software..... | 500 |
| 9.10 | HDMI TX - HD Multimedia Interface transmitter..... | 500 |
| 9.10.1 | HDMI Introduction..... | 500 |
| 9.10.2 | Features..... | 501 |
| 9.11 | Display / Sensor MIPI interfaces..... | 502 |
| 9.11.1 | Introduction..... | 502 |
| 9.11.2 | DSI..... | 503 |
| 9.11.3 | CSI-2..... | 504 |
| 9.11.4 | D - PHY..... | 505 |
| 9.12 | Audio subsystem..... | 507 |
| 9.12.1 | Audio subsystem module overview..... | 507 |
| 9.12.2 | Synchronous Serial Interface (SSI)..... | 509 |
| 9.12.3 | Digital Audio MUX (AUDMUX)..... | 510 |
| 9.12.4 | Enhanced Serial Audio Interface (ESAI)..... | 512 |
| 9.12.5 | Sony/Philips Digital Interface (SPDIF)..... | 512 |
| 9.12.6 | Asynchronous Sample Rate Converter (ASRC)..... | 514 |

Chapter 10

Clock and Power Management

| | | |
|----------|--|-----|
| 10.1 | Introduction..... | 519 |
| 10.2 | Device Power Management Architecture Components..... | 519 |
| 10.2.1 | Centralized components of clock generation and management..... | 520 |
| 10.2.2 | Centralized components of power generation, distribution and management..... | 521 |
| 10.2.3 | Reset generation and distribution system..... | 521 |
| 10.2.4 | Power and clock management framework..... | 521 |
| 10.3 | Clock Management..... | 522 |
| 10.3.1 | Centralized components of clock management system..... | 522 |
| 10.3.2 | Clock generation..... | 525 |
| 10.3.2.1 | Crystal Oscillator (XTALOSC) | 525 |
| 10.3.2.2 | LVDS I/O ports..... | 525 |

| Section number | Title | Page |
|----------------|---|------|
| 10.3.2.3 | PLLs..... | 525 |
| 10.3.2.3.1 | General PLL Control and Status Functions..... | 527 |
| 10.3.2.4 | CCM | 528 |
| 10.3.2.5 | Low Power Clock Gating unit (LPCG)..... | 529 |
| 10.3.3 | Peripheral components of clock management system..... | 529 |
| 10.3.3.1 | Interface and functional clock..... | 530 |
| 10.3.3.2 | Block level clock management..... | 531 |
| 10.3.3.2.1 | Master clock protocol..... | 531 |
| 10.3.3.2.2 | Slave clock protocol..... | 532 |
| 10.3.3.3 | Clock Domain(s)..... | 532 |
| 10.3.3.4 | Domain level clock management..... | 533 |
| 10.3.3.5 | Domain dependencies..... | 533 |
| 10.4 | Power management..... | 533 |
| 10.4.1 | Centralized Components of Power Management System..... | 533 |
| 10.4.1.1 | Integrated PMU..... | 534 |
| 10.4.1.1.1 | Digital LDO Regulators..... | 536 |
| 10.4.1.1.2 | Analog LDO regulators..... | 537 |
| 10.4.1.1.3 | USB LDO..... | 537 |
| 10.4.1.1.4 | SNVS regulator..... | 538 |
| 10.4.1.1.5 | Reverse well biasing..... | 538 |
| 10.4.1.2 | GPC - General Power Controller..... | 538 |
| 10.4.1.3 | SRC - System reset Controller..... | 539 |
| 10.4.1.4 | Power domain(s)..... | 539 |
| 10.4.1.4.1 | Power distribution | 540 |
| 10.4.1.4.2 | Domain Memory and domain logic state retention in case of Power Gating. | 541 |
| 10.4.1.4.3 | Power Gating Domain Management..... | 542 |
| 10.4.1.4.3.1 | Cortex-A9 Core Platform..... | 542 |
| 10.4.1.4.3.2 | GPU3D, GPU2D and VPU..... | 543 |
| 10.4.1.4.3.3 | SoC..... | 543 |

| Section number | Title | Page |
|----------------|---|------|
| 10.4.1.4.4 | Power Gating domain dependencies..... | 544 |
| 10.4.1.5 | Voltage domains..... | 544 |
| 10.4.1.6 | Voltage domain management..... | 545 |
| 10.4.1.6.1 | Dynamic..... | 545 |
| 10.4.1.6.1.1 | DVFS..... | 545 |
| 10.4.1.6.1.2 | Voltage Scaling..... | 546 |
| 10.4.1.6.2 | Static | 546 |
| 10.4.1.6.2.1 | Standby Leakage reduction (SLR)..... | 546 |
| 10.4.1.6.2.2 | ANALOG PHYs IPs -..... | 547 |
| 10.4.1.6.3 | Voltage domain dependencies..... | 547 |
| 10.4.1.6.4 | IO voltage | 547 |
| 10.4.1.7 | i.MX 6Dual/6Quad system domains layout..... | 547 |
| 10.4.2 | Power management techniques..... | 550 |
| 10.4.2.1 | Power saving techniques..... | 550 |
| 10.4.2.2 | Thermal-aware power management..... | 551 |
| 10.4.2.3 | Peripheral Power management..... | 551 |
| 10.4.2.3.1 | Main memory power management..... | 551 |
| 10.4.2.3.2 | Video-Graphics system power management..... | 553 |
| 10.4.2.3.3 | IO power reduction..... | 553 |
| 10.4.3 | Examples of External Power Supply Interfacing in the i.MX 6Dual/6Quad based systems | 553 |
| 10.5 | ONOFF (Button)..... | 557 |

Chapter 11 System Security

| | | |
|----------|-----------------------------------|-----|
| 11.1 | Overview..... | 559 |
| 11.2 | Central Security Unit (CSU)..... | 560 |
| 11.2.1 | CSU Overview..... | 560 |
| 11.2.2 | CSU Features..... | 561 |
| 11.2.3 | CSU Functional Description..... | 561 |
| 11.2.3.1 | CSU Peripheral Access Policy..... | 561 |

| Section number | Title | Page |
|----------------|---|------|
| 11.3 | Cryptographic Acceleration and Assurance Module (CAAM)..... | 562 |
| 11.3.1 | CAAM Overview..... | 563 |
| 11.4 | Secure Non-Volatile Storage (SNVS)..... | 563 |
| 11.4.1 | SNVS Overview..... | 563 |
| 11.4.2 | Tamper Detection..... | 564 |
| 11.5 | High Assurance Boot (HAB)..... | 564 |
| 11.6 | System JTAG Controller (SJC)..... | 565 |

Chapter 12

ARM Cortex A9 MPCore Platform (ARM)

| | | |
|----------|---|-----|
| 12.1 | Overview..... | 567 |
| 12.2 | External Signals..... | 567 |
| 12.3 | Platform configuration..... | 568 |
| 12.3.1 | Platform and SCU configuration..... | 569 |
| 12.3.2 | Core configuration..... | 569 |
| 12.3.3 | PL310 L2 Cache configuration..... | 569 |
| 12.3.4 | Endian Modes..... | 570 |
| 12.3.5 | Memory Parity error support | 570 |
| 12.4 | Performance and Power..... | 570 |
| 12.4.1 | Low-Power design..... | 570 |
| 12.4.1.1 | SRPG (State Retention Power Gating)..... | 571 |
| 12.4.1.2 | Dynamic Voltage and Frequency Scaling (DVFS)..... | 571 |
| 12.4.2 | Clocks, frequency goals..... | 571 |
| 12.4.2.1 | ARM Clock..... | 572 |
| 12.4.2.2 | Bus Clocks..... | 572 |
| 12.4.2.3 | Debug Clocks..... | 572 |
| 12.5 | Core Platform Sub-Blocks details..... | 572 |
| 12.5.1 | ARM Cortex A9 MPCore Processor..... | 572 |
| 12.5.2 | Media Processing Engine (MPE - NEON)..... | 573 |

| Section number | Title | Page |
|----------------|--|------|
| 12.5.3 | Generic Interrupt Controller (GIC)..... | 573 |
| 12.5.3.1 | Interrupt Controller Features..... | 573 |
| 12.5.3.2 | About the Interrupt Controller..... | 574 |
| 12.5.3.3 | Interrupt Controller Clock frequency..... | 574 |
| 12.5.3.4 | TrustZone support..... | 574 |
| 12.5.4 | Instruction and data caches (L1)..... | 574 |
| 12.5.4.1 | L1 features..... | 575 |
| 12.5.5 | L2 Cache and controller (PL310)..... | 575 |
| 12.6 | Debug and Trace Sub-blocks (CoreSight components)..... | 575 |
| 12.6.1 | Debug Access Port (DAP) | 575 |
| 12.6.2 | Program Trace Macrocell (PTM)..... | 576 |
| 12.6.2.1 | Program Flow Trace (PFT)..... | 576 |
| 12.6.3 | Cross Trigger Interface (CTI)..... | 577 |
| 12.6.4 | Embedded Trace Buffer (ETB)..... | 578 |
| 12.6.4.1 | AMBA Trace Bus (ATB) Replicator | 578 |

Chapter 13

AHB to IP Bridge (AIPSTZ)

| | | |
|--------|---|-----|
| 13.1 | Overview..... | 579 |
| 13.1.1 | Features..... | 579 |
| 13.2 | Clocks..... | 579 |
| 13.3 | General Operation..... | 580 |
| 13.4 | Functional Description..... | 581 |
| 13.5 | Access Protections..... | 581 |
| 13.6 | Access Support..... | 581 |
| 13.7 | Initialization Information..... | 582 |
| 13.7.1 | Security Block..... | 582 |
| 13.8 | AIPSTZ Memory Map/Register Definition..... | 583 |
| 13.8.1 | Master Priviledge Registers (AIPSTZx_MPR)..... | 584 |

Chapter 14

AHB-to-APBH Bridge with DMA (APBH-Bridge-DMA)

| | | |
|---------|--|-----|
| 14.1 | Overview..... | 601 |
| 14.2 | Clocks..... | 602 |
| 14.3 | APBH DMA..... | 603 |
| 14.4 | NAND Read Status Polling Example..... | 608 |
| 14.5 | APBH Memory Map/Register Definition..... | 610 |
| 14.5.1 | AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0n)..... | 616 |
| 14.5.2 | AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1n)..... | 618 |
| 14.5.3 | AHB to APBH Bridge Control and Status Register 2 (APBH_CTRL2n)..... | 621 |
| 14.5.4 | AHB to APBH Bridge Channel Register (APBH_CHANNEL_CTRLn)..... | 626 |
| 14.5.5 | AHB to APBH DMA Device Assignment Register (APBH_DEVSEL)..... | 627 |
| 14.5.6 | AHB to APBH DMA burst size (APBH_DMA_BURST_SIZE)..... | 628 |
| 14.5.7 | AHB to APBH DMA Debug Register (APBH_DEBUG)..... | 629 |
| 14.5.8 | APBH DMA Channel n Current Command Address Register (APBH_CHn_CURCMDAR)..... | 630 |
| 14.5.9 | APBH DMA Channel n Next Command Address Register (APBH_CHn_NXTCMDAR)..... | 631 |
| 14.5.10 | APBH DMA Channel n Command Register (APBH_CHn_CMD)..... | 631 |
| 14.5.11 | APBH DMA Channel n Buffer Address Register (APBH_CHn_BAR)..... | 634 |
| 14.5.12 | APBH DMA Channel n Semaphore Register (APBH_CHn_SEMA)..... | 635 |
| 14.5.13 | AHB to APBH DMA Channel n Debug Information (APBH_CHn_DEBUG1)..... | 635 |
| 14.5.14 | AHB to APBH DMA Channel n Debug Information (APBH_CHn_DEBUG2)..... | 638 |
| 14.5.15 | APBH Bridge Version Register (APBH_VERSION)..... | 639 |

| Chapter 15 | | |
| Asynchronous Sample Rate Converter (ASRC) | | |
| 15.1 | Overview..... | 641 |
| 15.1.1 | Features..... | 643 |
| 15.1.2 | Modes of Operation..... | 644 |
| 15.1.2.1 | Data Transfer Schemes..... | 644 |
| 15.1.2.1.1 | Data Input Modes..... | 644 |
| 15.1.2.1.2 | Data Output Modes..... | 646 |
| 15.1.2.2 | Word Alignment Supported..... | 647 |
| 15.1.2.2.1 | Input Data Alignment Modes..... | 647 |
| 15.1.2.2.2 | Output Data Alignment Modes..... | 647 |
| 15.2 | Clocks..... | 648 |
| 15.3 | Interrupts..... | 648 |
| 15.4 | DMA requests..... | 649 |
| 15.5 | Functional Description..... | 649 |
| 15.5.1 | Algorithm Description..... | 649 |
| 15.5.1.1 | Signal processing flow..... | 649 |
| 15.5.1.2 | Operation of the Filter..... | 653 |
| 15.5.1.2.1 | Support of Physical Clocks..... | 653 |
| 15.6 | Startup Procedure..... | 655 |
| 15.7 | ASRC Memory Map/Register Definition..... | 659 |
| 15.7.1 | ASRC Control Register (ASRC_ASRCCTR)..... | 662 |
| 15.7.2 | ASRC Interrupt Enable Register (ASRC_ASRIER)..... | 665 |
| 15.7.3 | ASRC Channel Number Configuration Register (ASRC_ASRCNCR)..... | 666 |
| 15.7.4 | ASRC Filter Configuration Status Register (ASRC_ASRCFG)..... | 668 |
| 15.7.5 | ASRC Clock Source Register (ASRC_ASRCSTR)..... | 670 |
| 15.7.6 | ASRC Clock Divider Register 1 (ASRC_ASRCDDR1)..... | 674 |
| 15.7.7 | ASRC Clock Divider Register 2 (ASRC_ASRCDDR2)..... | 675 |
| 15.7.8 | ASRC Status Register (ASRC_ASRSTR)..... | 676 |

| Section number | Title | Page |
|----------------|---|------|
| 15.7.9 | ASRC Parameter Register n (ASRC_ASRPMnn)..... | 679 |
| 15.7.10 | ASRC ASRC Task Queue FIFO Register 1 (ASRC_ASRTFR1)..... | 680 |
| 15.7.11 | ASRC Channel Counter Register (ASRC_ASRCCR)..... | 681 |
| 15.7.12 | ASRC Data Input Register for Pair x (ASRC_ASRDIn)..... | 682 |
| 15.7.13 | ASRC Data Output Register for Pair x (ASRC_ASRDO _n)..... | 682 |
| 15.7.14 | ASRC Ideal Ratio for Pair A-High Part (ASRC_ASRIDRHA)..... | 683 |
| 15.7.15 | ASRC Ideal Ratio for Pair A -Low Part (ASRC_ASRIDRLA)..... | 684 |
| 15.7.16 | ASRC Ideal Ratio for Pair B-High Part (ASRC_ASRIDRHB)..... | 684 |
| 15.7.17 | ASRC Ideal Ratio for Pair B-Low Part (ASRC_ASRIDRLB)..... | 685 |
| 15.7.18 | ASRC Ideal Ratio for Pair C-High Part (ASRC_ASRIDRHC)..... | 685 |
| 15.7.19 | ASRC Ideal Ratio for Pair C-Low Part (ASRC_ASRIDRLC)..... | 686 |
| 15.7.20 | ASRC 76kHz Period in terms of ASRC processing clock (ASRC_ASR76K)..... | 687 |
| 15.7.21 | ASRC 56kHz Period in terms of ASRC processing clock (ASRC_ASR56K)..... | 688 |
| 15.7.22 | ASRC Misc Control Register for Pair A (ASRC_ASRMCRA)..... | 689 |
| 15.7.23 | ASRC FIFO Status Register for Pair A (ASRC_ASRFSTA)..... | 691 |
| 15.7.24 | ASRC Misc Control Register for Pair B (ASRC_ASRMCRB)..... | 692 |
| 15.7.25 | ASRC FIFO Status Register for Pair B (ASRC_ASRFSTB)..... | 694 |
| 15.7.26 | ASRC Misc Control Register for Pair C (ASRC_ASRMCRC)..... | 695 |
| 15.7.27 | ASRC FIFO Status Register for Pair C (ASRC_ASRFSTC)..... | 697 |
| 15.7.28 | ASRC Misc Control Register 1 for Pair X (ASRC_ASRMCR1 _n)..... | 698 |

Chapter 16

Digital Audio Multiplexer (AUDMUX)

| | | |
|--------|---------------------------|-----|
| 16.1 | Overview..... | 701 |
| 16.1.1 | Features..... | 703 |
| 16.1.2 | Modes and Operations..... | 703 |
| 16.2 | External Signals..... | 703 |
| 16.3 | Clocks..... | 704 |
| 16.3.1 | Clock Inputs..... | 705 |
| 16.3.2 | Clock Diagram..... | 705 |

| Section number | Title | Page |
|----------------|--|------|
| 16.3.3 | Clocking Restrictions..... | 706 |
| 16.4 | Default Register Configuration..... | 706 |
| 16.4.1 | Default Port Configuration..... | 706 |
| 16.5 | Functional Description..... | 706 |
| 16.5.1 | Operating Modes..... | 706 |
| 16.5.1.1 | Port Receive Data Modes..... | 708 |
| 16.5.1.1.1 | Normal Mode..... | 709 |
| 16.5.1.1.2 | Internal Network Mode..... | 710 |
| 16.5.1.1.3 | Transmit Data Output Enable Assertion..... | 716 |
| 16.5.1.2 | Tx/Rx Switch and External Network Mode..... | 717 |
| 16.5.1.3 | Timing Modes..... | 718 |
| 16.5.1.3.1 | Synchronous Mode (4-Wire Interface)..... | 718 |
| 16.5.1.3.2 | Asynchronous Mode (6-Wire Interface)..... | 720 |
| 16.5.2 | Connectivity Between Ports..... | 723 |
| 16.5.2.1 | Internal Port to External Port Connectivity..... | 724 |
| 16.5.2.2 | External Port to External Port Connectivity..... | 725 |
| 16.5.2.3 | Internal Port to Internal Port Connectivity..... | 725 |
| 16.5.2.4 | Loopback Connectivity..... | 726 |
| 16.6 | AUDMUX Memory Map/Register Definition..... | 726 |
| 16.6.1 | Port Timing Control Register 1 (AUDMUX_PTCR1)..... | 727 |
| 16.6.2 | Port Data Control Register 1 (AUDMUX_PDCR1)..... | 729 |
| 16.6.3 | Port Timing Control Register 2 (AUDMUX_PTCR2)..... | 730 |
| 16.6.4 | Port Data Control Register 2 (AUDMUX_PDCR2)..... | 732 |
| 16.6.5 | Port Timing Control Register 3 (AUDMUX_PTCR3)..... | 733 |
| 16.6.6 | Port Data Control Register 3 (AUDMUX_PDCR3)..... | 735 |
| 16.6.7 | Port Timing Control Register 4 (AUDMUX_PTCR4)..... | 736 |
| 16.6.8 | Port Data Control Register 4 (AUDMUX_PDCR4)..... | 738 |
| 16.6.9 | Port Timing Control Register 5 (AUDMUX_PTCR5)..... | 739 |
| 16.6.10 | Port Data Control Register 5 (AUDMUX_PDCR5)..... | 741 |

| Section number | Title | Page |
|----------------|--|------|
| 16.6.11 | Port Timing Control Register 6 (AUDMUX_PTCR6)..... | 742 |
| 16.6.12 | Port Data Control Register 6 (AUDMUX_PDCR6)..... | 744 |
| 16.6.13 | Port Timing Control Register 7 (AUDMUX_PTCR7)..... | 745 |
| 16.6.14 | Port Data Control Register 7 (AUDMUX_PDCR7)..... | 747 |

Chapter 17

40BIT Correcting ECC Accelerator (BCH)

| | | |
|----------|--|-----|
| 17.1 | Overview..... | 749 |
| 17.2 | Operation..... | 751 |
| 17.2.1 | BCH Limitations and Assumptions..... | 752 |
| 17.2.2 | Flash Page Layout..... | 753 |
| 17.2.3 | Determining the ECC layout for a device..... | 755 |
| 17.2.3.1 | 4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(213)..... | 755 |
| 17.2.3.2 | 4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(213) for data and GF(214) for metadata..... | 756 |
| 17.2.4 | Data Buffers in System Memory..... | 756 |
| 17.3 | Memory to Memory (Loopback) Operation..... | 759 |
| 17.4 | Programming the BCH/GPMI Interfaces..... | 760 |
| 17.4.1 | BCH Encoding for NAND Writes..... | 761 |
| 17.4.1.1 | DMA Structure Code Example..... | 763 |
| 17.4.1.2 | Using the BCH Encoder..... | 768 |
| 17.4.2 | BCH Decoding for NAND Reads..... | 769 |
| 17.4.2.1 | DMA Structure Code Example..... | 773 |
| 17.4.2.2 | Using the Decoder..... | 776 |
| 17.4.3 | Interrupts..... | 778 |
| 17.5 | Behavior During Reset..... | 779 |
| 17.6 | BCH Memory Map/Register Definition..... | 780 |
| 17.6.1 | Hardware BCH ECC Accelerator Control Register (BCH_CTRL)..... | 781 |
| 17.6.2 | Hardware ECC Accelerator Status Register 0 (BCH_STATUS0)..... | 783 |
| 17.6.3 | Hardware ECC Accelerator Mode Register (BCH_MODE)..... | 785 |

| Section number | Title | Page |
|----------------|--|------|
| 17.6.4 | Hardware BCH ECC Loopback Encode Buffer Register (BCH_ENCODEPTR)..... | 786 |
| 17.6.5 | Hardware BCH ECC Loopback Data Buffer Register (BCH_DATAPTR)..... | 786 |
| 17.6.6 | Hardware BCH ECC Loopback Metadata Buffer Register (BCH_METAPTR)..... | 787 |
| 17.6.7 | Hardware ECC Accelerator Layout Select Register (BCH_LAYOUTSELECT)..... | 787 |
| 17.6.8 | Hardware BCH ECC Flash 0 Layout 0 Register (BCH_FLASH0LAYOUT0)..... | 788 |
| 17.6.9 | Hardware BCH ECC Flash 0 Layout 1 Register (BCH_FLASH0LAYOUT1)..... | 790 |
| 17.6.10 | Hardware BCH ECC Flash 1 Layout 0 Register (BCH_FLASH1LAYOUT0)..... | 791 |
| 17.6.11 | Hardware BCH ECC Flash 1 Layout 1 Register (BCH_FLASH1LAYOUT1)..... | 793 |
| 17.6.12 | Hardware BCH ECC Flash 2 Layout 0 Register (BCH_FLASH2LAYOUT0)..... | 794 |
| 17.6.13 | Hardware BCH ECC Flash 2 Layout 1 Register (BCH_FLASH2LAYOUT1)..... | 796 |
| 17.6.14 | Hardware BCH ECC Flash 3 Layout 0 Register (BCH_FLASH3LAYOUT0)..... | 797 |
| 17.6.15 | Hardware BCH ECC Flash 3 Layout 1 Register (BCH_FLASH3LAYOUT1)..... | 799 |
| 17.6.16 | Hardware BCH ECC Debug Register0 (BCH_DEBUG0)..... | 800 |
| 17.6.17 | KES Debug Read Register (BCH_DBGKESREAD)..... | 802 |
| 17.6.18 | Chien Search Debug Read Register (BCH_DBGCSFEREAD)..... | 803 |
| 17.6.19 | Syndrome Generator Debug Read Register (BCH_DBGSYNDGENREAD)..... | 803 |
| 17.6.20 | Bus Master and ECC Controller Debug Read Register (BCH_DBGAHBMREAD)..... | 804 |
| 17.6.21 | Block Name Register (BCH_BLOCKNAME)..... | 804 |
| 17.6.22 | BCH Version Register (BCH_VERSION)..... | 805 |

Chapter 18

Clock Controller Module (CCM)

| | | |
|--------|------------------------|-----|
| 18.1 | Overview..... | 807 |
| 18.1.1 | Features..... | 807 |
| 18.1.2 | CCM Block Diagram..... | 808 |
| 18.2 | External Signals..... | 810 |
| 18.3 | CCM Clock Tree..... | 810 |
| 18.4 | System Clocks..... | 814 |

| Section number | Title | Page |
|----------------|--|------|
| 18.5 | Functional Description..... | 821 |
| 18.5.1 | Clock Generation..... | 821 |
| 18.5.1.1 | External Low Frequency Clock - CKIL | 821 |
| 18.5.1.1.1 | CKIL synchronizing to IPG_CLK..... | 821 |
| 18.5.1.2 | External High Frequency Clock - CKIH and internal oscillator..... | 822 |
| 18.5.1.3 | PLL reference clock..... | 822 |
| 18.5.1.3.1 | ARM PLL..... | 822 |
| 18.5.1.3.2 | USB PLLs..... | 822 |
| 18.5.1.3.3 | System PLL..... | 823 |
| 18.5.1.3.4 | Audio / Video PLL..... | 823 |
| 18.5.1.3.5 | MLB PLL..... | 824 |
| 18.5.1.3.6 | Ethernet PLL..... | 824 |
| 18.5.1.4 | Phase Fractional Dividers (PFD)..... | 824 |
| 18.5.1.5 | CCM internal clock generation..... | 824 |
| 18.5.1.5.1 | Clock Switcher..... | 825 |
| 18.5.1.5.2 | PLL bypass procedure..... | 827 |
| 18.5.1.5.3 | PLL clock change..... | 827 |
| 18.5.1.5.4 | Clock Root Generator..... | 827 |
| 18.5.1.5.5 | Initial values controlled by the System JTAG Controller (SJC)..... | 839 |
| 18.5.1.5.6 | Divider change handshake..... | 840 |
| 18.5.1.6 | Disabling / Enabling PLLs..... | 840 |
| 18.5.1.7 | Low Power Clock Gating module (LPCG)..... | 840 |
| 18.5.1.7.1 | MMDC handshake..... | 842 |
| 18.5.2 | DVFS support..... | 842 |
| 18.5.3 | Power modes..... | 843 |
| 18.5.3.1 | RUN mode..... | 843 |
| 18.5.3.2 | WAIT mode..... | 843 |
| 18.5.3.2.1 | Entering WAIT mode | 843 |
| 18.5.3.2.2 | Exiting WAIT mode | 844 |

| Section number | Title | Page |
|----------------|---|------|
| 18.5.3.3 | STOP mode..... | 844 |
| 18.5.3.3.1 | Entering STOP mode | 844 |
| 18.5.3.3.2 | Exiting STOP mode..... | 845 |
| 18.6 | CCM Memory Map/Register Definition..... | 845 |
| 18.6.1 | CCM Control Register (CCM_CCR)..... | 847 |
| 18.6.2 | CCM Control Divider Register (CCM_CCDR)..... | 849 |
| 18.6.3 | CCM Status Register (CCM_CSR)..... | 850 |
| 18.6.4 | CCM Clock Swither Register (CCM_CCSR)..... | 851 |
| 18.6.5 | CCM Arm Clock Root Register (CCM_CACRR)..... | 853 |
| 18.6.6 | CCM Bus Clock Divider Register (CCM_CBCDR)..... | 854 |
| 18.6.7 | CCM Bus Clock Multiplexer Register (CCM_CBCMR)..... | 856 |
| 18.6.8 | CCM Serial Clock Multiplexer Register 1 (CCM_CSCMR1)..... | 859 |
| 18.6.9 | CCM Serial Clock Multiplexer Register 2 (CCM_CSCMR2)..... | 862 |
| 18.6.10 | CCM Serial Clock Divider Register 1 (CCM_CSCDR1)..... | 863 |
| 18.6.11 | CCM SSI1 Clock Divider Register (CCM_CS1CDR)..... | 865 |
| 18.6.12 | CCM SSI2 Clock Divider Register (CCM_CS2CDR)..... | 867 |
| 18.6.13 | CCM D1 Clock Divider Register (CCM_CDCDR)..... | 869 |
| 18.6.14 | CCM HSC Clock Divider Register (CCM_CHSCCDR)..... | 871 |
| 18.6.15 | CCM Serial Clock Divider Register 2 (CCM_CSCDR2)..... | 873 |
| 18.6.16 | CCM Serial Clock Divider Register 3 (CCM_CSCDR3)..... | 875 |
| 18.6.17 | CCM Divider Handshake In-Process Register (CCM_CDHIPR)..... | 877 |
| 18.6.18 | CCM Low Power Control Register (CCM_CLPCR)..... | 880 |
| 18.6.19 | CCM Interrupt Status Register (CCM_CISR)..... | 883 |
| 18.6.20 | CCM Interrupt Mask Register (CCM_CIMR)..... | 886 |
| 18.6.21 | CCM Clock Output Source Register (CCM_CCOSR)..... | 889 |
| 18.6.22 | CCM General Purpose Register (CCM_CGPR)..... | 892 |
| 18.6.23 | CCM Clock Gating Register 0 (CCM_CCGR0)..... | 893 |
| 18.6.24 | CCM Clock Gating Register 1 (CCM_CCGR1)..... | 895 |
| 18.6.25 | CCM Clock Gating Register 2 (CCM_CCGR2)..... | 896 |

| Section number | Title | Page |
|----------------|--|------|
| 18.6.26 | CCM Clock Gating Register 3 (CCM_CCGR3)..... | 898 |
| 18.6.27 | CCM Clock Gating Register 4 (CCM_CCGR4)..... | 899 |
| 18.6.28 | CCM Clock Gating Register 5 (CCM_CCGR5)..... | 900 |
| 18.6.29 | CCM Clock Gating Register 6 (CCM_CCGR6)..... | 902 |
| 18.6.30 | CCM Module Enable Override Register (CCM_CMEOR)..... | 903 |
| 18.7 | CCM Analog Memory Map/Register Definition..... | 904 |
| 18.7.1 | Analog ARM PLL control Register (CCM_ANALOG_PLL_ARMn)..... | 908 |
| 18.7.2 | Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1n)..... | 910 |
| 18.7.3 | Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2n)..... | 912 |
| 18.7.4 | Analog System PLL Control Register (CCM_ANALOG_PLL_SYSn)..... | 914 |
| 18.7.5 | 528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS)..... | 916 |
| 18.7.6 | Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM)..... | 916 |
| 18.7.7 | Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM)..... | 917 |
| 18.7.8 | Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDION)..... | 918 |
| 18.7.9 | Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM).. | 920 |
| 18.7.10 | Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM)..... | 921 |
| 18.7.11 | Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEOOn)..... | 922 |
| 18.7.12 | Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM)... | 924 |
| 18.7.13 | Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM)..... | 925 |
| 18.7.14 | MLB PLL Control Register (CCM_ANALOG_PLL_MLBn)..... | 926 |
| 18.7.15 | Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENETn)..... | 928 |
| 18.7.16 | 480MHz Clock (from PLL_USB2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480n)..... | 930 |
| 18.7.17 | 528MHz Clock (From PLL_SYS) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528n)..... | 932 |
| 18.7.18 | Miscellaneous Control Register (CCM_ANALOG_MISC0n)..... | 934 |

| Section number | Title | Page |
|--|---|------|
| 18.7.19 | Miscellaneous Control Register (CCM_ANALOG_MISC2n)..... | 935 |
| <p style="text-align: center;">Chapter 19 MIPI CSI to IPU Gasket (CSI2IPU)</p> | | |
| 19.1 | Overview..... | 939 |
| 19.1.1 | CSI2IPU feature summary..... | 940 |
| 19.1.2 | CSI2IPU architectural description..... | 940 |
| 19.2 | CSI2IPU signals..... | 941 |
| 19.3 | Timing interface..... | 942 |
| 19.4 | Payload data output formats..... | 943 |
| 19.5 | CSI2IPU Memory Map/Register Definition..... | 950 |
| 19.5.1 | CSI 2 IPU Gasket Software Reset (CSI2IPU_SW_RST)..... | 951 |
| <p style="text-align: center;">Chapter 20 Display Content Integrity Checker (DCIC)</p> | | |
| 20.1 | Overview..... | 953 |
| 20.1.1 | Block Diagram..... | 954 |
| 20.1.2 | Features..... | 955 |
| 20.2 | Functional Description..... | 955 |
| 20.2.1 | Generic synchronous parallel display interface..... | 955 |
| 20.2.2 | CRC Polynomial..... | 956 |
| 20.2.3 | Mode of operation..... | 957 |
| 20.2.4 | Interrupts..... | 957 |
| 20.2.5 | Software reset..... | 957 |
| 20.2.6 | Clock domains..... | 958 |
| 20.2.7 | External controller mismatch indication signal..... | 958 |
| 20.2.8 | Power saving..... | 958 |
| 20.2.9 | System Considerations..... | 958 |
| 20.3 | DCIC Memory Map/Register Definition..... | 959 |
| 20.3.1 | DCIC Control Register (DCICx_DCICC)..... | 960 |
| 20.3.2 | DCIC Interrupt Control Register (DCICx_DCICIC)..... | 961 |

Chapter 21 Enhanced Configurable SPI (ECSPI)

| | | |
|------------|---|-----|
| 21.1 | Overview..... | 967 |
| 21.1.1 | Features..... | 968 |
| 21.1.2 | Modes and Operations..... | 968 |
| 21.2 | External Signals..... | 969 |
| 21.3 | Clocks..... | 972 |
| 21.4 | Functional Description..... | 972 |
| 21.4.1 | Master Mode..... | 973 |
| 21.4.2 | Slave Mode..... | 973 |
| 21.4.3 | Low Power Modes..... | 974 |
| 21.4.4 | Operations..... | 974 |
| 21.4.4.1 | Typical Master Mode..... | 974 |
| 21.4.4.1.1 | Master Mode with SPI_RDY..... | 975 |
| 21.4.4.1.2 | Master Mode with Wait States..... | 977 |
| 21.4.4.1.3 | Master Mode with SS_CTL[3:0] Control..... | 977 |
| 21.4.4.1.4 | Master Mode with Phase Control..... | 978 |
| 21.4.4.2 | Typical Slave Mode..... | 979 |
| 21.4.5 | Reset..... | 980 |
| 21.4.6 | Interrupts..... | 980 |
| 21.4.7 | DMA | 981 |
| 21.4.8 | Byte Order..... | 982 |
| 21.5 | Initialization..... | 983 |
| 21.6 | Applications..... | 983 |

| Section number | Title | Page |
|----------------|--|------|
| 21.7 | ECSPI Memory Map/Register Definition..... | 984 |
| 21.7.1 | Receive Data Register (ECSPIx_RXDATA)..... | 986 |
| 21.7.2 | Transmit Data Register (ECSPIx_TXDATA)..... | 987 |
| 21.7.3 | Control Register (ECSPIx_CONREG)..... | 987 |
| 21.7.4 | Config Register (ECSPIx_CONFIGREG)..... | 990 |
| 21.7.5 | Interrupt Control Register (ECSPIx_INTREG)..... | 992 |
| 21.7.6 | DMA Control Register (ECSPIx_DMAREG)..... | 993 |
| 21.7.7 | Status Register (ECSPIx_STATREG)..... | 995 |
| 21.7.8 | Sample Period Control Register (ECSPIx_PERIODREG)..... | 996 |
| 21.7.9 | Test Control Register (ECSPIx_TESTREG)..... | 998 |
| 21.7.10 | Message Data Register (ECSPIx_MSGDATA)..... | 999 |

Chapter 22

External Interface Module (EIM)

| | | |
|----------|--|------|
| 22.1 | Overview..... | 1001 |
| 22.1.1 | Features..... | 1003 |
| 22.1.2 | Modes of Operation..... | 1003 |
| 22.1.2.1 | Asynchronous Mode..... | 1004 |
| 22.1.2.2 | Asynchronous Page Read Mode..... | 1004 |
| 22.1.2.3 | Multiplexed Address/Data Mode..... | 1004 |
| 22.1.2.4 | Burst Clock Mode..... | 1005 |
| 22.1.2.5 | Low Power Modes..... | 1006 |
| 22.1.2.6 | Boot Mode..... | 1006 |
| 22.2 | External Signals..... | 1006 |
| 22.2.1 | Other Important Block I/O Signals Internal to the SoC..... | 1011 |
| 22.3 | Clocks..... | 1012 |
| 22.4 | Chip Select Memory Map..... | 1013 |

| Section number | Title | Page |
|----------------|---|------|
| 22.5 | Functional Description..... | 1013 |
| 22.5.1 | Bus Sizing Configuration..... | 1013 |
| 22.5.1.1 | 8 BIT PORT SUPPORT..... | 1014 |
| 22.5.1.1.1 | MOTOROLA 68000..... | 1014 |
| 22.5.1.1.2 | INTEL 386..... | 1014 |
| 22.5.2 | EIM Operational Modes..... | 1014 |
| 22.5.3 | Burst Mode (Synchronous) Memory Operation..... | 1015 |
| 22.5.4 | Burst Clock Divisor (BCD)..... | 1016 |
| 22.5.5 | Burst Clock Start (BCS)..... | 1016 |
| 22.5.6 | Multiplexed Address/Data Mode Support..... | 1017 |
| 22.5.7 | Mixed Master/Memory Burst Modes Support..... | 1017 |
| 22.5.8 | AXI (Master) Bus Cycles Support..... | 1017 |
| 22.5.9 | WAIT_B Signal, RWSC and WWSC bit fields Usage..... | 1020 |
| 22.5.10 | IPS Register Interface..... | 1020 |
| 22.5.11 | MRS Set for PSRAM..... | 1020 |
| 22.5.12 | EIM Access Termination | 1021 |
| 22.5.13 | Error Conditions..... | 1021 |
| 22.5.14 | DTACK Mode..... | 1022 |
| 22.5.15 | RDY_INT Signal as Interrupt..... | 1022 |
| 22.5.16 | RDY_INT Signal as Ready After Reset Indication..... | 1022 |
| 22.5.17 | EIM_GRANT / EIM_BUSY Handshake Description..... | 1023 |
| 22.5.18 | LPMD / LPACK Handshake Description..... | 1023 |
| 22.5.19 | Endianness..... | 1023 |
| 22.5.20 | Strobe Signal Use..... | 1024 |
| 22.6 | Initialization Information..... | 1025 |
| 22.6.1 | Bootng from EIM..... | 1025 |
| 22.7 | Typical Application..... | 1025 |
| 22.7.1 | Access to AMD Flash..... | 1026 |
| 22.7.1.1 | AMD Flash Asynchronous Mode Configuration..... | 1026 |

| Section number | Title | Page |
|----------------|---|------|
| 22.7.1.2 | AMD Flash Utility..... | 1026 |
| 22.7.2 | Access to Intel Sibley Flash..... | 1027 |
| 22.7.2.1 | Intel Sibley Flash Asynchronous Mode Configuration..... | 1027 |
| 22.7.2.2 | Intel Sibley Flash Synchronous Mode Configuration..... | 1027 |
| 22.7.2.3 | Intel Sibley Flash Utility..... | 1028 |
| 22.7.3 | Access to MDOC Device..... | 1028 |
| 22.7.3.1 | MDOC Device Boot..... | 1028 |
| 22.7.3.2 | MDOC Device Asynchronous Mode Configuration..... | 1028 |
| 22.7.3.3 | MDOC Device Utility..... | 1029 |
| 22.7.4 | Access to Micron PSRAM | 1029 |
| 22.7.4.1 | Micron PSRAM Asynchronous Mode Configuration..... | 1029 |
| 22.7.4.2 | Micron PSRAM Synchronous Mode Configuration..... | 1029 |
| 22.7.5 | Access to Samsung OneNAND | 1029 |
| 22.7.5.1 | Samsung OneNAND Boot..... | 1030 |
| 22.7.5.2 | Samsung OneNAND Asynchronous Mode Configuration..... | 1030 |
| 22.7.5.3 | Samsung OneNAND Synchronous Mode Configuration..... | 1030 |
| 22.7.5.4 | Samsung OneNAND Utility..... | 1031 |
| 22.7.6 | Access to Samsung UtRAM | 1031 |
| 22.7.6.1 | Samsung UtRAM Asynchronous Mode Configuration..... | 1031 |
| 22.7.6.2 | Samsung UtRAM Synchronous Mode Configuration..... | 1031 |
| 22.7.7 | Access to Spansion Flash | 1032 |
| 22.7.7.1 | Spansion Flash Asynchronous Mode Configuration..... | 1032 |
| 22.7.7.2 | Spansion Flash Synchronous Mode Configuration..... | 1032 |
| 22.7.7.3 | Spansion Flash Utility..... | 1032 |
| 22.7.8 | 8 bit support..... | 1034 |
| 22.8 | External Bus Timing Diagrams..... | 1034 |
| 22.8.1 | Asynchronous Read Memory Accesses Timing Diagram..... | 1034 |
| 22.8.2 | Asynchronous Write Memory Accesses Timing Diagram..... | 1035 |
| 22.8.3 | Asynchronous Read/Write Memory Accesses Timing Diagram..... | 1036 |

| Section number | Title | Page |
|----------------|---|------|
| 22.8.4 | Asynchronous Read/Write Using RAL, WAL and CSREC..... | 1038 |
| 22.8.5 | Consecutive Asynchronous Write Memory Accesses Timing Diagram..... | 1039 |
| 22.8.6 | Consecutive Asynchronous Read Memory Accesses Timing Diagram..... | 1042 |
| 22.8.7 | Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=0..... | 1044 |
| 22.8.8 | Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=1..... | 1045 |
| 22.8.9 | Asynchronous Page Mode Access..... | 1046 |
| 22.8.10 | DTACK Mode - AXI Single Access..... | 1046 |
| 22.8.11 | DTACK Mode - AXI Single Write Access..... | 1049 |
| 22.8.12 | DTACK Mode - AXI Burst Access..... | 1050 |
| 22.9 | EIM Memory Map/Register Definition..... | 1051 |
| 22.9.1 | Chip Select n General Configuration Register 1 (EIM_CSnGCR1)..... | 1054 |
| 22.9.2 | Chip Select n General Configuration Register 2 (EIM_CSnGCR2)..... | 1058 |
| 22.9.3 | Chip Select n Read Configuration Register 1 (EIM_CSnRCR1)..... | 1059 |
| 22.9.4 | Chip Select n Read Configuration Register 2 (EIM_CSnRCR2)..... | 1062 |
| 22.9.5 | Chip Select n Write Configuration Register 1 (EIM_CSnWCR1)..... | 1063 |
| 22.9.6 | Chip Select n Write Configuration Register 2 (EIM_CSnWCR2)..... | 1066 |
| 22.9.7 | EIM Configuration Register (EIM_WCR)..... | 1067 |
| 22.9.8 | EIM IP Access Register (EIM_WIAR)..... | 1068 |
| 22.9.9 | Error Address Register (EIM_EAR)..... | 1069 |

Chapter 23

10/100/1000-Mbps Ethernet MAC (ENET)

| | | |
|----------|--|------|
| 23.1 | Overview..... | 1071 |
| 23.1.1 | Features..... | 1071 |
| 23.1.1.1 | Ethernet MAC features..... | 1071 |
| 23.1.1.2 | IP protocol performance optimization features..... | 1073 |
| 23.1.1.3 | IEEE 1588 features..... | 1074 |
| 23.1.2 | Block diagram..... | 1074 |
| 23.2 | External Signals..... | 1075 |
| 23.3 | Clocks..... | 1081 |

| Section number | Title | Page |
|----------------|---|------|
| 23.4 | Memory map/register definition..... | 1081 |
| 23.4.1 | Interrupt Event Register (ENET_EIR)..... | 1084 |
| 23.4.2 | Interrupt Mask Register (ENET_EIMR)..... | 1087 |
| 23.4.3 | Receive Descriptor Active Register (ENET_RDAR)..... | 1090 |
| 23.4.4 | Transmit Descriptor Active Register (ENET_TDAR)..... | 1090 |
| 23.4.5 | Ethernet Control Register (ENET_ECR)..... | 1092 |
| 23.4.6 | MII Management Frame Register (ENET_MMFR)..... | 1094 |
| 23.4.7 | MII Speed Control Register (ENET_MSCR)..... | 1095 |
| 23.4.8 | MIB Control Register (ENET_MIBC)..... | 1097 |
| 23.4.9 | Receive Control Register (ENET_RCR)..... | 1098 |
| 23.4.10 | Transmit Control Register (ENET_TCR)..... | 1101 |
| 23.4.11 | Physical Address Lower Register (ENET_PALR)..... | 1103 |
| 23.4.12 | Physical Address Upper Register (ENET_PAUR)..... | 1103 |
| 23.4.13 | Opcode/Pause Duration Register (ENET_OPD)..... | 1104 |
| 23.4.14 | Descriptor Individual Upper Address Register (ENET_IAUR)..... | 1104 |
| 23.4.15 | Descriptor Individual Lower Address Register (ENET_IALR)..... | 1105 |
| 23.4.16 | Descriptor Group Upper Address Register (ENET_GAUR)..... | 1105 |
| 23.4.17 | Descriptor Group Lower Address Register (ENET_GALR)..... | 1106 |
| 23.4.18 | Transmit FIFO Watermark Register (ENET_TFWR)..... | 1106 |
| 23.4.19 | Receive Descriptor Ring Start Register (ENET_RDSR)..... | 1107 |
| 23.4.20 | Transmit Buffer Descriptor Ring Start Register (ENET_TDSR)..... | 1108 |
| 23.4.21 | Maximum Receive Buffer Size Register (ENET_MRBR)..... | 1108 |
| 23.4.22 | Receive FIFO Section Full Threshold (ENET_RSFL)..... | 1109 |
| 23.4.23 | Receive FIFO Section Empty Threshold (ENET_RSEM)..... | 1110 |
| 23.4.24 | Receive FIFO Almost Empty Threshold (ENET_RAEM)..... | 1110 |
| 23.4.25 | Receive FIFO Almost Full Threshold (ENET_RAFL)..... | 1111 |
| 23.4.26 | Transmit FIFO Section Empty Threshold (ENET_TSEM)..... | 1111 |
| 23.4.27 | Transmit FIFO Almost Empty Threshold (ENET_TAEM)..... | 1111 |
| 23.4.28 | Transmit FIFO Almost Full Threshold (ENET_TAFL)..... | 1112 |

| Section number | Title | Page |
|----------------|---|------|
| 23.4.29 | Transmit Inter-Packet Gap (ENET_TIPG)..... | 1112 |
| 23.4.30 | Frame Truncation Length (ENET_FTRL)..... | 1113 |
| 23.4.31 | Transmit Accelerator Function Configuration (ENET_TACC)..... | 1113 |
| 23.4.32 | Receive Accelerator Function Configuration (ENET_RACC)..... | 1115 |
| 23.4.33 | Timer Control Register (ENET_ATCR)..... | 1116 |
| 23.4.34 | Timer Value Register (ENET_ATVR)..... | 1118 |
| 23.4.35 | Timer Offset Register (ENET_ATOFF)..... | 1118 |
| 23.4.36 | Timer Period Register (ENET_ATPER)..... | 1118 |
| 23.4.37 | Timer Correction Register (ENET_ATCOR)..... | 1119 |
| 23.4.38 | Time-Stamping Clock Period Register (ENET_ATINC)..... | 1119 |
| 23.4.39 | Timestamp of Last Transmitted Frame (ENET_ATSTMP)..... | 1120 |
| 23.4.40 | Timer Global Status Register (ENET_TGSR)..... | 1120 |
| 23.4.41 | Timer Control Status Register (ENET_TCSR _n)..... | 1121 |
| 23.4.42 | Timer Compare Capture Register (ENET_TCCR _n)..... | 1122 |
| 23.4.43 | Statistic event counters..... | 1123 |
| 23.5 | Functional description..... | 1125 |
| 23.5.1 | Ethernet MAC frame formats..... | 1125 |
| 23.5.1.1 | Pause Frames..... | 1127 |
| 23.5.1.2 | Magic packets..... | 1128 |
| 23.5.2 | IP and higher layers frame format..... | 1128 |
| 23.5.2.1 | Ethernet types..... | 1129 |
| 23.5.2.2 | IPv4 datagram format..... | 1129 |
| 23.5.2.3 | IPv6 datagram format..... | 1130 |
| 23.5.2.4 | Internet Control Message Protocol (ICMP) datagram format..... | 1131 |
| 23.5.2.5 | User Datagram Protocol (UDP) datagram format..... | 1131 |
| 23.5.2.6 | TCP datagram format..... | 1132 |
| 23.5.3 | IEEE 1588 message formats..... | 1133 |
| 23.5.3.1 | Transport encapsulation..... | 1133 |
| 23.5.3.1.1 | UDP/IP..... | 1133 |

| Section number | Title | Page |
|----------------|--|------|
| 23.5.3.1.2 | Native Ethernet (PTPv2)..... | 1134 |
| 23.5.3.2 | PTP header..... | 1134 |
| 23.5.3.2.1 | PTPv1 header..... | 1134 |
| 23.5.3.2.2 | PTPv2 header..... | 1135 |
| 23.5.4 | MAC receive..... | 1136 |
| 23.5.4.1 | Collision detection in half-duplex mode..... | 1137 |
| 23.5.4.2 | Preamble processing..... | 1138 |
| 23.5.4.3 | MAC address check..... | 1138 |
| 23.5.4.3.1 | Unicast address check..... | 1138 |
| 23.5.4.3.2 | Multicast and unicast address resolution..... | 1138 |
| 23.5.4.3.3 | Broadcast address reject..... | 1139 |
| 23.5.4.3.4 | Miss-bit implementation..... | 1139 |
| 23.5.4.4 | Frame length/type verification: payload length check..... | 1140 |
| 23.5.4.5 | Frame length/type verification: frame length check..... | 1140 |
| 23.5.4.6 | VLAN frames processing..... | 1141 |
| 23.5.4.7 | Pause frame termination..... | 1141 |
| 23.5.4.8 | CRC check..... | 1141 |
| 23.5.4.9 | Frame padding removal..... | 1142 |
| 23.5.5 | MAC transmit..... | 1142 |
| 23.5.5.1 | Frame payload padding..... | 1143 |
| 23.5.5.2 | MAC address insertion..... | 1143 |
| 23.5.5.3 | CRC-32 generation..... | 1144 |
| 23.5.5.4 | Inter-packet gap (IPG)..... | 1144 |
| 23.5.5.5 | Collision detection and handling — half-duplex operation only..... | 1144 |
| 23.5.6 | Full-duplex flow control operation..... | 1146 |
| 23.5.6.1 | Remote device congestion..... | 1146 |
| 23.5.6.2 | Local device/FIFO congestion..... | 1146 |
| 23.5.7 | Magic packet detection..... | 1147 |
| 23.5.7.1 | Sleep mode..... | 1148 |

| Section number | Title | Page |
|----------------|--|------|
| 23.5.7.2 | Magic packet detection..... | 1148 |
| 23.5.7.3 | Wakeup..... | 1148 |
| 23.5.8 | IP accelerator functions..... | 1148 |
| 23.5.8.1 | Checksum calculation..... | 1149 |
| 23.5.8.2 | Additional padding processing..... | 1150 |
| 23.5.8.3 | 32-bit Ethernet payload alignment..... | 1150 |
| 23.5.8.3.1 | Receive processing..... | 1150 |
| 23.5.8.3.2 | Transmit processing..... | 1151 |
| 23.5.8.4 | Received frame discard..... | 1151 |
| 23.5.8.5 | IPv4 fragments..... | 1151 |
| 23.5.8.6 | IPv6 support..... | 1152 |
| 23.5.8.6.1 | Receive processing..... | 1152 |
| 23.5.8.6.2 | Transmit processing..... | 1153 |
| 23.5.9 | Resets and stop controls..... | 1153 |
| 23.5.9.1 | Hardware reset..... | 1153 |
| 23.5.9.2 | Soft reset..... | 1153 |
| 23.5.9.3 | Hardware freeze..... | 1154 |
| 23.5.9.4 | Graceful stop..... | 1154 |
| 23.5.9.4.1 | Graceful transmit stop (GTS)..... | 1154 |
| 23.5.9.4.2 | Graceful receive stop (GRS)..... | 1155 |
| 23.5.9.4.3 | Graceful stop interrupt (GRA)..... | 1156 |
| 23.5.10 | IEEE 1588 functions..... | 1156 |
| 23.5.10.1 | Adjustable timer module..... | 1157 |
| 23.5.10.1.1 | Adjustable timer implementation..... | 1157 |
| 23.5.10.2 | Transmit timestamping..... | 1159 |
| 23.5.10.3 | Receive timestamping..... | 1159 |
| 23.5.10.4 | Time synchronization..... | 1159 |
| 23.5.11 | FIFO thresholds..... | 1160 |
| 23.5.11.1 | Receive FIFO..... | 1160 |

| Section number | Title | Page |
|----------------|--|------|
| 23.5.11.2 | Transmit FIFO..... | 1161 |
| 23.5.12 | Loopback options..... | 1163 |
| 23.5.13 | Legacy buffer descriptors..... | 1164 |
| 23.5.13.1 | Legacy receive buffer descriptor..... | 1164 |
| 23.5.13.2 | Legacy transmit buffer descriptor..... | 1164 |
| 23.5.14 | Enhanced buffer descriptors..... | 1165 |
| 23.5.14.1 | Enhanced receive buffer descriptor..... | 1165 |
| 23.5.14.2 | Enhanced transmit buffer descriptor..... | 1169 |
| 23.5.15 | Client FIFO application interface..... | 1172 |
| 23.5.15.1 | Data structure description..... | 1172 |
| 23.5.15.2 | Data structure examples..... | 1173 |
| 23.5.15.3 | Frame status..... | 1174 |
| 23.5.16 | FIFO protection..... | 1174 |
| 23.5.16.1 | Transmit FIFO underflow..... | 1175 |
| 23.5.16.2 | Transmit FIFO overflow..... | 1175 |
| 23.5.16.3 | Receive FIFO overflow..... | 1176 |
| 23.5.17 | PHY management interface..... | 1177 |
| 23.5.17.1 | MDIO frame format..... | 1177 |
| 23.5.17.2 | MDIO clock generation..... | 1178 |
| 23.5.17.3 | MDIO operation..... | 1178 |
| 23.5.18 | Ethernet interfaces..... | 1178 |
| 23.5.18.1 | RMII interface..... | 1179 |
| 23.5.18.2 | RGMII interface..... | 1180 |
| 23.5.18.3 | MII Interface — transmit..... | 1181 |
| 23.5.18.3.1 | Transmit with collision — half-duplex..... | 1182 |
| 23.5.18.4 | MII interface — receive..... | 1182 |

Chapter 24

Enhanced Periodic Interrupt Timer (EPIT)

| | | |
|----------|--|------|
| 24.1 | Overview..... | 1185 |
| 24.1.1 | EPIT features..... | 1185 |
| 24.1.2 | EPIT modes and operations..... | 1186 |
| 24.2 | External signals..... | 1186 |
| 24.3 | Clocks..... | 1186 |
| 24.4 | Functional Description..... | 1188 |
| 24.4.1 | Operating modes..... | 1188 |
| 24.4.1.1 | Operating in set-and-forget mode..... | 1188 |
| 24.4.1.2 | Operating in free-running mode..... | 1188 |
| 24.4.2 | Operations..... | 1189 |
| 24.4.3 | Compare Event..... | 1189 |
| 24.4.3.1 | Counter Value Overwrite..... | 1190 |
| 24.4.3.2 | Low-Power Mode Behavior..... | 1191 |
| 24.4.3.3 | Debug Mode Behavior..... | 1191 |
| 24.5 | Initialization/ Application Information..... | 1191 |
| 24.5.1 | Change of Clock Source..... | 1191 |
| 24.6 | EPIT Memory Map/Register Definition..... | 1192 |
| 24.6.1 | Control register (EPITx_CR)..... | 1192 |
| 24.6.2 | Status register (EPITx_SR)..... | 1195 |
| 24.6.3 | Load register (EPITx_LR)..... | 1196 |
| 24.6.4 | Compare register (EPITx_CMPR)..... | 1196 |
| 24.6.5 | Counter register (EPITx_CNR)..... | 1197 |

Chapter 25

Enhanced Serial Audio Interface (ESAI)

| | | |
|--------|---------------|------|
| 25.1 | Overview..... | 1199 |
| 25.1.1 | Features..... | 1201 |

| Section number | Title | Page |
|----------------|--|------|
| 25.1.2 | Modes of Operation..... | 1201 |
| 25.1.2.1 | Normal/Network/On-Demand Mode Selection..... | 1201 |

Chapter 27 General Power Controller (GPC)

| | | |
|----------|--|------|
| 27.1 | Overview..... | 1339 |
| 27.2 | Clocks..... | 1340 |
| 27.3 | DVFS overview..... | 1340 |
| 27.3.1 | Features..... | 1342 |
| 27.4 | Component Blocks description..... | 1343 |
| 27.4.1 | dvfs_stdb_smpl block..... | 1343 |
| 27.4.2 | dvfs_sig_wt block..... | 1343 |
| 27.4.3 | dvfs_pre_avg block..... | 1344 |
| 27.4.4 | dvfs_ld_add block..... | 1346 |
| 27.4.5 | dvfs_ema_avg block..... | 1347 |
| 27.4.6 | dvfs_thres_cmp block..... | 1351 |
| 27.4.7 | dvfs_thresh_count block..... | 1352 |
| 27.4.8 | Load Tracking Buffer Register..... | 1353 |
| 27.4.9 | Frequency Pattern Generator..... | 1353 |
| 27.5 | DVFS output event/interrupt configuration..... | 1355 |
| 27.5.1 | Interrupts..... | 1355 |
| 27.5.2 | DVFS Change Request Sequence Diagrams..... | 1355 |
| 27.6 | Power Gating Control (PGC)..... | 1356 |
| 27.6.1 | Overview..... | 1357 |
| 27.6.1.1 | Features..... | 1358 |
| 27.7 | GPC Interrupt Controller (INTC)..... | 1358 |
| 27.7.1 | Interrupt Controller features..... | 1358 |

| Section number | Title | Page |
|----------------|--|------|
| 27.8 | GPC Memory Map/Register Definition..... | 1359 |
| 27.8.1 | GPC Interface control register (GPC_CNTR)..... | 1359 |
| 27.8.2 | GPC Power Gating Register (GPC_PGR)..... | 1362 |
| 27.8.3 | IRQ masking register 1 (GPC_IMR1)..... | 1362 |
| 27.8.4 | IRQ masking register 2 (GPC_IMR2)..... | 1363 |
| 27.8.5 | IRQ masking register 3 (GPC_IMR3)..... | 1363 |
| 27.8.6 | IRQ masking register 4 (GPC_IMR4)..... | 1364 |
| 27.8.7 | IRQ status resister 1 (GPC_ISR1)..... | 1364 |
| 27.8.8 | IRQ status resister 2 (GPC_ISR2)..... | 1365 |
| 27.8.9 | IRQ status resister 3 (GPC_ISR3)..... | 1365 |
| 27.8.10 | IRQ status resister 4 (GPC_ISR4)..... | 1366 |
| 27.9 | PGC Memory Map/Register Definition..... | 1366 |
| 27.9.1 | PGC Control Register (PGC_GPU_CTRL)..... | 1367 |
| 27.9.2 | Power Up Sequence Control Register (PGC_GPU_PUPSCR)..... | 1368 |
| 27.9.3 | Pull Down Sequence Control Register (PGC_GPU_PDNSCR)..... | 1368 |
| 27.9.4 | Power Gating Controller Status Register (PGC_GPU_SR)..... | 1369 |
| 27.9.5 | PGC Control Register (PGC_CPU_CTRL)..... | 1370 |
| 27.9.6 | Power Up Sequence Control Register (PGC_CPU_PUPSCR)..... | 1370 |
| 27.9.7 | Pull Down Sequence Control Register (PGC_CPU_PDNSCR)..... | 1371 |
| 27.9.8 | Power Gating Controller Status Register (PGC_CPU_SR)..... | 1372 |
| 27.10 | DVFS Memory Map/Register Definition..... | 1372 |
| 27.10.1 | DVFS Thresholds (DVFS_THRS)..... | 1373 |
| 27.10.2 | DVFS Counters thresholds (DVFS_COUN)..... | 1374 |
| 27.10.3 | DVFS general purpose bits weight (DVFS_SIG1)..... | 1374 |
| 27.10.4 | DVFS general purpose bits weight (DVFS_DVFSIG0)..... | 1375 |
| 27.10.5 | DVFS general purpose bit 0 weight counter (DVFS_DVFSGPC0)..... | 1376 |
| 27.10.6 | DVFS general purpose bit 1 weight counter (DVFS_DVFSGPC1)..... | 1377 |
| 27.10.7 | DVFS general purpose bits enables (DVFS_DVFSGPBT)..... | 1378 |
| 27.10.8 | DVFS EMAC settings (DVFS_DVFSEMAC)..... | 1380 |

| Section number | Title | Page |
|----------------|--|------|
| 27.10.9 | DVFS Control (DVFSC_CNTR)..... | 1382 |
| 27.10.10 | DVFS Load Tracking Register 0, portion 0 (DVFSC_DVFSLTR0_0)..... | 1385 |
| 27.10.11 | DVFS Load Tracking Register 0, portion 1 (DVFSC_DVFSLTR0_1)..... | 1386 |
| 27.10.12 | DVFS Load Tracking Register 1, portion 0 (DVFSC_DVFSLTR1_0)..... | 1387 |
| 27.10.13 | DVFS Load Tracking Register 3, portion 1 (DVFSC_DVFSLTR1_1)..... | 1387 |
| 27.10.14 | DVFS pattern 0 length (DVFSC_DVFSPT0)..... | 1388 |
| 27.10.15 | DVFS pattern 1 length (DVFSC_DVFSPT1)..... | 1389 |
| 27.10.16 | DVFS pattern 2 length (DVFSC_DVFSPT2)..... | 1389 |
| 27.10.17 | DVFS pattern 3 length (DVFSC_DVFSPT3)..... | 1390 |

Chapter 28

General Purpose Input/Output (GPIO)

| | | |
|----------|--|------|
| 28.1 | Overview..... | 1391 |
| 28.1.1 | Block Diagram..... | 1393 |
| 28.1.2 | Features..... | 1394 |
| 28.2 | External Signals..... | 1395 |
| 28.3 | Clocks..... | 1400 |
| 28.4 | GPIO Functional Description..... | 1401 |
| 28.4.1 | GPIO Function..... | 1401 |
| 28.4.2 | GPIO Programming..... | 1401 |
| 28.4.2.1 | GPIO Read Mode..... | 1401 |
| 28.4.2.2 | GPIO Write Mode..... | 1402 |
| 28.4.3 | Interrupt Control Unit..... | 1402 |
| 28.5 | GPIO Memory Map/Register Definition..... | 1402 |
| 28.5.1 | GPIO data register (GPIOx_DR)..... | 1404 |
| 28.5.2 | GPIO direction register (GPIOx_GDIR)..... | 1405 |
| 28.5.3 | GPIO pad status register (GPIOx_PSR)..... | 1406 |
| 28.5.4 | GPIO interrupt configuration register1 (GPIOx_ICR1)..... | 1406 |
| 28.5.5 | GPIO interrupt configuration register2 (GPIOx_ICR2)..... | 1410 |
| 28.5.6 | GPIO interrupt mask register (GPIOx_IMR)..... | 1414 |

| Section number | Title | Page |
|----------------|---|------|
| 28.5.7 | GPIO interrupt status register (GPIOx_ISR)..... | 1414 |
| 28.5.8 | GPIO edge select register (GPIOx_EDGE_SEL)..... | 1415 |

Chapter 29

General Purpose Media Interface (GPMI)

| | | |
|----------|--|------|
| 29.1 | Overview..... | 1417 |
| 29.2 | External Signals..... | 1418 |
| 29.3 | Clocks..... | 1419 |
| 29.4 | GPMI NAND Mode..... | 1420 |
| 29.4.1 | Multiple NAND Support..... | 1420 |
| 29.4.2 | GPMI NAND Timing and Clocking..... | 1421 |
| 29.4.3 | Basic NAND Timing..... | 1421 |
| 29.4.3.1 | NAND Asynchronous Timing..... | 1421 |
| 29.4.3.2 | NAND Asynchronous EDO Mode Timing..... | 1423 |
| 29.4.3.3 | NAND ONFI Source Synchronous Mode Timing..... | 1426 |
| 29.4.3.4 | NAND Toggle Mode Timing..... | 1431 |
| 29.4.4 | Hardware BCH Interface..... | 1439 |
| 29.5 | Behavior During Reset..... | 1440 |
| 29.6 | GPMI Memory Map/Register Definition..... | 1440 |
| 29.6.1 | GPMI Control Register 0 Description (GPMI_CTRL0n)..... | 1442 |
| 29.6.2 | GPMI Compare Register Description (GPMI_COMPARE)..... | 1444 |
| 29.6.3 | GPMI Integrated ECC Control Register Description (GPMI_ECCCTRLn)..... | 1445 |
| 29.6.4 | GPMI Integrated ECC Transfer Count Register Description (GPMI_ECCCOUNT)..... | 1446 |
| 29.6.5 | GPMI Payload Address Register Description (GPMI_PAYLOAD)..... | 1446 |
| 29.6.6 | GPMI Auxiliary Address Register Description (GPMI_AUXILIARY)..... | 1447 |
| 29.6.7 | GPMI Control Register 1 Description (GPMI_CTRL1n)..... | 1448 |
| 29.6.8 | GPMI Timing Register 0 Description (GPMI_TIMING0)..... | 1451 |
| 29.6.9 | GPMI Timing Register 1 Description (GPMI_TIMING1)..... | 1451 |
| 29.6.10 | GPMI Timing Register 2 Description (GPMI_TIMING2)..... | 1452 |
| 29.6.11 | GPMI DMA Data Transfer Register Description (GPMI_DATA)..... | 1453 |

| Section number | Title | Page |
|----------------|--|------|
| 29.6.12 | GPMI Status Register Description (GPMI_STAT)..... | 1453 |
| 29.6.13 | GPMI Debug Information Register Description (GPMI_DEBUG)..... | 1456 |
| 29.6.14 | GPMI Version Register Description (GPMI_VERSION)..... | 1457 |
| 29.6.15 | GPMI Debug2 Information Register Description (GPMI_DEBUG2)..... | 1457 |
| 29.6.16 | GPMI Debug3 Information Register Description (GPMI_DEBUG3)..... | 1460 |
| 29.6.17 | GPMI Double Rate Read DLL Control Register Description (GPMI_READ_DDR_DLL_CTRL)..... | 1461 |
| 29.6.18 | GPMI Double Rate Write DLL Control Register Description (GPMI_WRITE_DDR_DLL_CTRL)..... | 1462 |
| 29.6.19 | GPMI Double Rate Read DLL Status Register Description (GPMI_READ_DDR_DLL_STS)..... | 1464 |
| 29.6.20 | GPMI Double Rate Write DLL Status Register Description (GPMI_WRITE_DDR_DLL_STS)..... | 1465 |

Chapter 30 General Purpose Timer (GPT)

| | | |
|----------|-------------------------------------|------|
| 30.1 | Overview..... | 1469 |
| 30.1.1 | Features..... | 1471 |
| 30.1.2 | Modes and Operation..... | 1471 |
| 30.2 | External Signals..... | 1471 |
| 30.2.1 | External Clock Input | 1472 |
| 30.2.2 | Input Capture Trigger Signals | 1472 |
| 30.2.3 | Output Compare Signals..... | 1473 |
| 30.3 | Clocks..... | 1473 |
| 30.4 | Functional Description..... | 1475 |
| 30.4.1 | Operating Modes..... | 1475 |
| 30.4.1.1 | Restart Mode..... | 1475 |
| 30.4.1.2 | Free-Run Mode..... | 1475 |
| 30.4.2 | Operation..... | 1476 |
| 30.4.2.1 | Input Capture..... | 1476 |
| 30.4.2.2 | Output Compare..... | 1477 |
| 30.4.2.3 | Interrupts..... | 1478 |
| 30.4.2.4 | Low Power Mode Behavior..... | 1479 |
| 30.4.2.5 | Debug Mode Behavior..... | 1479 |

| Section number | Title | Page |
|----------------|---|------|
| 30.5 | Initialization/ Application Information | 1479 |
| 30.5.1 | Selecting the Clock Source | 1479 |
| 30.6 | GPT Memory Map/Register Definition..... | 1480 |
| 30.6.1 | GPT Control Register (GPT_CR)..... | 1481 |
| 30.6.2 | GPT Prescaler Register (GPT_PR)..... | 1485 |
| 30.6.3 | GPT Status Register (GPT_SR)..... | 1486 |
| 30.6.4 | GPT Interrupt Register (GPT_IR)..... | 1487 |
| 30.6.5 | GPT Output Compare Register 1 (GPT_OCR1)..... | 1488 |
| 30.6.6 | GPT Output Compare Register 2 (GPT_OCR2)..... | 1489 |
| 30.6.7 | GPT Output Compare Register 3 (GPT_OCR3)..... | 1489 |
| 30.6.8 | GPT Input Capture Register 1 (GPT_ICR1)..... | 1490 |
| 30.6.9 | GPT Input Capture Register 2 (GPT_ICR2)..... | 1490 |
| 30.6.10 | GPT Counter Register (GPT_CNT)..... | 1491 |

Chapter 31 2D Graphics Processing Unit (GPU2D)

| | | |
|----------|-------------------------------------|------|
| 31.1 | Overview..... | 1493 |
| 31.2 | GPU2D Block Diagram..... | 1493 |
| 31.2.1 | R2D GPU..... | 1493 |
| 31.2.2 | V2D GPU..... | 1494 |
| 31.3 | GPU2D Features..... | 1495 |
| 31.3.1 | Full Featured R2D GPU Pipeline..... | 1495 |
| 31.3.2 | Full Featured V2D GPU Pipeline..... | 1496 |
| 31.4 | GPU2D OPERATIONS..... | 1496 |
| 31.4.1 | R2D GPU Operations..... | 1496 |
| 31.4.1.1 | Line..... | 1496 |
| 31.4.1.2 | Rectangle Fill and Clear..... | 1497 |
| 31.4.1.3 | BitBLT..... | 1497 |
| 31.4.1.4 | Stretch BLT..... | 1498 |

| Section number | Title | Page |
|----------------|---|------|
| 31.4.1.5 | Monochrome Expansion and Mask BLT..... | 1498 |
| 31.4.1.5.1 | Monochrome expansion | 1499 |
| 31.4.1.5.2 | Mask BLT..... | 1499 |
| 31.4.1.6 | Filter BLT..... | 1499 |
| 31.4.1.7 | R2D Performance of different operations..... | 1500 |
| 31.4.1.8 | Rotation..... | 1501 |
| 31.4.1.9 | Transparency Mode..... | 1501 |
| 31.4.1.10 | Clipping..... | 1501 |
| 31.4.1.11 | R2D GPU Data Formats..... | 1501 |
| 31.4.1.12 | ARGB Data Conversion of R2D GPU..... | 1502 |
| 31.4.1.13 | YUV to RGB Conversion of R2D GPU..... | 1502 |
| 31.4.1.14 | Color Index Input Conversion Support of R2D GPU..... | 1503 |
| 31.4.1.15 | Source/Destination Pre-multiply and De-Multiply Support..... | 1503 |
| 31.4.1.16 | Alpha Blending..... | 1504 |
| 31.4.1.17 | GPU Cache Management..... | 1505 |
| 31.4.2 | V2D GPU Operations..... | 1506 |
| 31.4.2.1 | OPENVG 1.1-API STANDARD for VECTOR GRAPHICS ACCELERATION..... | 1506 |
| 31.4.2.2 | Advantages of Using OpenVG..... | 1506 |
| 31.4.2.3 | OpenVG Target Applications..... | 1506 |
| 31.4.2.4 | OpenVG Features..... | 1506 |
| 31.4.2.4.1 | Core API | 1506 |
| 31.4.2.4.2 | The VGU Utility Library | 1507 |
| 31.4.2.4.3 | OpenVG Rendering Pipeline..... | 1507 |

Chapter 32

3D Graphics Processing Unit (GPU3D)

| | | |
|--------|------------------------------|------|
| 32.1 | Overview..... | 1509 |
| 32.2 | GPU3D Block Diagram..... | 1509 |
| 32.3 | GPU3D Hardware Features..... | 1511 |
| 32.3.1 | Rasterization..... | 1515 |

| Section number | Title | Page |
|----------------|--------------------------|------|
| 32.3.2 | Fragment Processing..... | 1515 |
| 32.3.3 | Dest/Alpha Blending..... | 1517 |
| 32.3.4 | Z/Stencil Buffer..... | 1517 |
| 32.3.5 | Render Target..... | 1517 |
| 32.4 | Usage Mode..... | 1518 |

Chapter 33 HDMI Transmitter (HDMI)

| | | |
|--------------|--|------|
| 33.1 | Overview..... | 1519 |
| 33.1.1 | HDMI Operational Model Overview..... | 1519 |
| 33.1.1.1 | Interfaces..... | 1521 |
| 33.1.1.2 | Features..... | 1522 |
| 33.2 | External Signals..... | 1523 |
| 33.3 | Clocks..... | 1523 |
| 33.4 | Functional Description..... | 1524 |
| 33.4.1 | HDMI TX Functional Overview..... | 1524 |
| 33.4.2 | Video Pixel Sampler..... | 1525 |
| 33.4.2.1 | HDMI Transmitter Controller Databook Functional Description..... | 1526 |
| 33.4.3 | Supported Video Mode..... | 1528 |
| 33.4.4 | Video Packetizer..... | 1531 |
| 33.4.5 | Color Space Conversion..... | 1532 |
| 33.4.6 | Audio Interfaces..... | 1533 |
| 33.4.6.1 | CTS Calculation..... | 1534 |
| 33.4.6.2 | Audio DMA Interface..... | 1534 |
| 33.4.6.2.1 | AHB Master..... | 1535 |
| 33.4.6.2.2 | DMA Engine..... | 1537 |
| 33.4.6.2.2.1 | Functional Behavior..... | 1537 |
| 33.4.6.2.2.2 | DMA Operation..... | 1538 |
| 33.4.6.2.2.3 | Transfer Data, Package, and Word..... | 1540 |
| 33.4.6.2.3 | Audio FIFO..... | 1542 |

| Section number | Title | Page |
|----------------|--|------|
| 33.4.6.2.4 | FIFO Occupancy/FIFO Almost Empty Flags..... | 1542 |
| 33.4.7 | Supported Audio Formats..... | 1543 |
| 33.4.8 | Frame Composer..... | 1543 |
| 33.4.9 | HDCP Encryption Engine..... | 1545 |
| 33.4.10 | EDID/HDCP I2C E-DDC Interface..... | 1546 |
| 33.4.10.1 | I2C Master Interface Normal Mode..... | 1547 |
| 33.4.10.2 | I2C Master Interface Extended Read Mode..... | 1547 |
| 33.4.11 | System Configuration Interfaces..... | 1548 |
| 33.4.11.1 | AMBA AHB Slave Interface..... | 1548 |
| 33.4.12 | CEC Hardware Engine..... | 1548 |
| 33.5 | HDMI Memory Map/Register Definition..... | 1550 |
| 33.5.1 | Design Identification Register (HDMI_DESIGN_ID)..... | 1567 |
| 33.5.2 | Revision Identification Register (HDMI_REVISION_ID)..... | 1568 |
| 33.5.3 | Product Identification Register 0 (HDMI_PRODUCT_ID0)..... | 1568 |
| 33.5.4 | Product Identification Register 1 (HDMI_PRODUCT_ID1)..... | 1569 |
| 33.5.5 | Configuration Identification Register 0 (HDMI_CONFIG0_ID)..... | 1569 |
| 33.5.6 | Configuration Identification Register 1 (HDMI_CONFIG1_ID)..... | 1570 |
| 33.5.7 | Configuration Identification Register 2 (HDMI_CONFIG2_ID)..... | 1571 |
| 33.5.8 | Configuration Identification Register 3 (HDMI_CONFIG3_ID)..... | 1572 |
| 33.5.9 | Frame Composer Interrupt Status Register 0 (HDMI_IH_FC_STAT0)..... | 1572 |
| 33.5.10 | Frame Composer Interrupt Status Register 1 (HDMI_IH_FC_STAT1)..... | 1573 |
| 33.5.11 | Frame Composer Interrupt Status Register 2 (HDMI_IH_FC_STAT2)..... | 1574 |
| 33.5.12 | Audio Sampler Interrupt Status Register (HDMI_IH_AS_STAT0)..... | 1575 |
| 33.5.13 | PHY Interface Interrupt Status Register (HDMI_IH_PHY_STAT0)..... | 1576 |
| 33.5.14 | E-DDC I2C Master Interrupt Status Register (HDMI_IH_I2CM_STAT0)..... | 1577 |
| 33.5.15 | CEC Interrupt Status Register (HDMI_IH_CEC_STAT0)..... | 1578 |
| 33.5.16 | Video Packetizer Interrupt Status Register (HDMI_IH_VP_STAT0)..... | 1579 |
| 33.5.17 | PHY GEN2 I2C Master Interrupt Status Register (HDMI_IH_I2CMPHY_STAT0)..... | 1580 |
| 33.5.18 | AHB Audio DMA Interrupt Status Register (HDMI_IH_AHBDMAAUD_STAT0)..... | 1580 |

| Section number | Title | Page |
|----------------|---|------|
| 33.5.19 | Frame Composer Interrupt Mute Control Register 0 (HDMI_IH_MUTE_FC_STAT0)..... | 1582 |
| 33.5.20 | Frame Composer Interrupt Mute Control Register 1 (HDMI_IH_MUTE_FC_STAT1)..... | 1583 |
| 33.5.21 | Frame Composer Interrupt Mute Control Register 2 (HDMI_IH_MUTE_FC_STAT2)..... | 1584 |
| 33.5.22 | Audio Sampler Interrupt Mute Control Register 0 (HDMI_IH_MUTE_AS_STAT0)..... | 1584 |
| 33.5.23 | PHY Interface Interrupt Mute Control Register (HDMI_IH_MUTE_PHY_STAT0)..... | 1585 |
| 33.5.24 | E-DDC I2C Master Interrupt Mute Control Register (HDMI_IH_MUTE_I2CM_STAT0)..... | 1586 |
| 33.5.25 | CEC Interrupt Mute Control Register (HDMI_IH_MUTE_CEC_STAT0)..... | 1586 |
| 33.5.26 | Video Packetizer Interrupt Mute Control Register (HDMI_IH_MUTE_VP_STAT0)..... | 1587 |
| 33.5.27 | PHY GEN 2 I2C Master Interrupt Mute Control Register (HDMI_IH_MUTE_I2CMPHY_STAT0)..... | 1588 |
| 33.5.28 | AHB Audio DMA Interrupt Mute Control Register (HDMI_IH_MUTE_AHBDMAAUD_STAT0)..... | 1589 |
| 33.5.29 | Global Interrupt Mute Control Register (HDMI_IH_MUTE)..... | 1590 |
| 33.5.30 | Video Input Mapping and Internal Data Enable Configuration Register (HDMI_TX_INVID0)..... | 1590 |
| 33.5.31 | Video Input Stuffing Enable Register (HDMI_TX_INSTUFFING)..... | 1591 |
| 33.5.32 | Video Input GY Data Channel Stuffing Register 0 (HDMI_TX_GYDATA0)..... | 1592 |
| 33.5.33 | Video Input GY Data Channel Stuffing Register 1 (HDMI_TX_GYDATA1)..... | 1593 |
| 33.5.34 | Video Input RCR Data Channel Stuffing Register 0 (HDMI_TX_RCRDATA0)..... | 1593 |
| 33.5.35 | Video Input RCR Data Channel Stuffing Register 1 (HDMI_TX_RCRDATA1)..... | 1594 |
| 33.5.36 | Video Input RCB Data Channel Stuffing Register 0 (HDMI_TX_BCBDATA0)..... | 1594 |
| 33.5.37 | Video Input RCB Data Channel Stuffing Register 1 (HDMI_TX_BCBDATA1)..... | 1595 |
| 33.5.38 | Video Packetizer Packing Phase Status Register (HDMI_VP_STATUS)..... | 1595 |
| 33.5.39 | Video Packetizer Pixel Repetition and Color Depth Register (HDMI_VP_PR_CD)..... | 1596 |
| 33.5.40 | Video Packetizer Stuffing and Default Packing Phase Register (HDMI_VP_STUFF)..... | 1597 |
| 33.5.41 | Video Packetizer YCC422 Remapping Register (HDMI_VP_REMAP)..... | 1598 |
| 33.5.42 | Video Packetizer Output, Bypass, and Enable Configuration Register (HDMI_VP_CONF)..... | 1599 |
| 33.5.43 | VP_STAT (HDMI_VP_STAT)..... | 1599 |
| 33.5.44 | VP_INT (HDMI_VP_INT)..... | 1600 |
| 33.5.45 | Video Packetizer Interrupt Mask Register (HDMI_VP_MASK)..... | 1601 |
| 33.5.46 | VP_POL (HDMI_VP_POL)..... | 1602 |
| 33.5.47 | Frame Composer Input Video HActive Pixels Register 0 (HDMI_FC_INHACTIV0)..... | 1603 |

| Section number | Title | Page |
|----------------|---|------|
| 33.5.48 | Frame Composer Input Video HActive Pixels Register 1 (HDMI_FC_INHACTIV1)..... | 1604 |
| 33.5.49 | Frame Composer Input Video HBlank Pixels Register 0 (HDMI_FC_INHBLANK0)..... | 1604 |
| 33.5.50 | Frame Composer Input Video HBlank Pixels Register 1 (HDMI_FC_INHBLANK1)..... | 1605 |
| 33.5.51 | Frame Composer Input Video VActive Pixels Register 0 (HDMI_FC_INVACTIV0)..... | 1606 |
| 33.5.52 | Frame Composer Input Video VActive Pixels Register 1 (HDMI_FC_INVACTIV1)..... | 1606 |
| 33.5.53 | Frame Composer Input Video VBlank Pixels Register (HDMI_FC_INVBLANK)..... | 1607 |
| 33.5.54 | Frame Composer Input Video HSync Front Porch Register 0 (HDMI_FC_HSYNCINDELAY0)..... | 1607 |
| 33.5.55 | Frame Composer Input Video HSync Front Porch Register 1 (HDMI_FC_HSYNCINDELAY1)..... | 1608 |
| 33.5.56 | Frame Composer Input Video HSync Width Register 0 (HDMI_FC_HSYNCINWIDTH0)..... | 1609 |
| 33.5.57 | Frame Composer Input Video HSync Width Register 1 (HDMI_FC_HSYNCINWIDTH1)..... | 1609 |
| 33.5.58 | Frame Composer Input Video VSync Front Porch Register (HDMI_FC_VSYNCINDELAY)..... | 1610 |
| 33.5.59 | Frame Composer Input Video VSync Width Register (HDMI_FC_VSYNCINWIDTH)..... | 1610 |
| 33.5.60 | Frame Composer Input Video Refresh Rate Register 0 (HDMI_FC_INFREQ0)..... | 1611 |
| 33.5.61 | Frame Composer Input Video Refresh Rate Register 1 (HDMI_FC_INFREQ1)..... | 1611 |
| 33.5.62 | Frame Composer Input Video Refresh Rate Register 2 (HDMI_FC_INFREQ2)..... | 1612 |
| 33.5.63 | Frame Composer Control Period Duration Register (HDMI_FC_CTRLDUR)..... | 1613 |
| 33.5.64 | Frame Composer Extended Control Period Duration Register (HDMI_FC_EXCTRLDUR)..... | 1613 |
| 33.5.65 | Frame Composer Extended Control Period Maximum Spacing Register (HDMI_FC_EXCTRLSPAC)..... | 1614 |
| 33.5.66 | Frame Composer Channel 0 Non-Preamble Data Register (HDMI_FC_CH0PREAM)..... | 1614 |
| 33.5.67 | Frame Composer Channel 1 Non-Preamble Data Register (HDMI_FC_CH1PREAM)..... | 1615 |
| 33.5.68 | Frame Composer Channel 2 Non-Preamble Data Register (HDMI_FC_CH2PREAM)..... | 1615 |
| 33.5.69 | Frame Composer AVI Configuration Register 3 (HDMI_FC_AVICONF3)..... | 1616 |
| 33.5.70 | Frame Composer GCP Packet Configuration Register (HDMI_FC_GCP)..... | 1616 |
| 33.5.71 | Frame Composer AVI Packet Configuration Register 0 (HDMI_FC_AVICONF0)..... | 1617 |
| 33.5.72 | Frame Composer AVI Packet Configuration Register 1 (HDMI_FC_AVICONF1)..... | 1618 |
| 33.5.73 | FC_AVICONF Frame Composer AVI Packet Configuration Register 2 (HDMI_FC_AVICONF2)..... | 1619 |
| 33.5.74 | Frame Composer AVI Packet VIC Register (HDMI_FC_AVIVID)..... | 1620 |
| 33.5.75 | Frame Composer AVI Packet End of Top Bar Register 0 (HDMI_FC_AVIETB0)..... | 1620 |
| 33.5.76 | Frame Composer AVI Packet End of Top Bar Register 1 (HDMI_FC_AVIETB1)..... | 1621 |

| Section number | Title | Page |
|----------------|---|------|
| 33.5.77 | Frame Composer AVI Packet Start of Bottom Bar Register 0 (HDMI_FC_AVISBB0)..... | 1621 |
| 33.5.78 | Frame Composer AVI Packet Start of Bottom Bar Register 1 (HDMI_FC_AVISBB1)..... | 1622 |
| 33.5.79 | Frame Composer AVI Packet End of Left Bar Register 0 (HDMI_FC_AVIELB0)..... | 1622 |
| 33.5.80 | Frame Composer AVI Packet End of Left Bar Register 1 (HDMI_FC_AVIELB1)..... | 1623 |
| 33.5.81 | Frame Composer AVI Packet Start of Right Bar Register 0 (HDMI_FC_AVISRB0)..... | 1623 |
| 33.5.82 | Frame Composer AVI Packet Start of Right Bar Register 1 (HDMI_FC_AVISRB1)..... | 1624 |
| 33.5.83 | Frame Composer AUD Packet Configuration Register 0 (HDMI_FC_AUDICONF0)..... | 1624 |
| 33.5.84 | Frame Composer AUD Packet Configuration Register 1 (HDMI_FC_AUDICONF1)..... | 1625 |
| 33.5.85 | Frame Composer AUD Packet Configuration Register 2 (HDMI_FC_AUDICONF2)..... | 1625 |
| 33.5.86 | Frame Composer AUD Packet Configuration Register 3 (HDMI_FC_AUDICONF3)..... | 1626 |
| 33.5.87 | Frame Composer VSI Packet Data IEEE Register 0 (HDMI_FC_VSDIEEEID0)..... | 1626 |
| 33.5.88 | Frame Composer VSI Packet Data Size Register (HDMI_FC_VSDSIZE)..... | 1627 |
| 33.5.89 | Frame Composer VSI Packet Data IEEE Register 1 (HDMI_FC_VSDIEEEID1)..... | 1627 |
| 33.5.90 | Frame Composer VSI Packet Data IEEE Register 2 (HDMI_FC_VSDIEEEID2)..... | 1628 |
| 33.5.91 | Frame Composer VSI Packet Data IEEE Register 0 (HDMI_FC_VSDPAYLOAD0)..... | 1628 |
| 33.5.92 | Frame Composer VSI Packet Data IEEE Register 1 (HDMI_FC_VSDPAYLOAD1)..... | 1629 |
| 33.5.93 | Frame Composer VSI Packet Data IEEE Register 2 (HDMI_FC_VSDPAYLOAD2)..... | 1629 |
| 33.5.94 | Frame Composer VSI Packet Data IEEE Register 3 (HDMI_FC_VSDPAYLOAD3)..... | 1630 |
| 33.5.95 | Frame Composer VSI Packet Data IEEE Register 4 (HDMI_FC_VSDPAYLOAD4)..... | 1630 |
| 33.5.96 | Frame Composer VSI Packet Data IEEE Register 5 (HDMI_FC_VSDPAYLOAD5)..... | 1631 |
| 33.5.97 | Frame Composer VSI Packet Data IEEE Register 6 (HDMI_FC_VSDPAYLOAD6)..... | 1631 |
| 33.5.98 | Frame Composer VSI Packet Data IEEE Register 7 (HDMI_FC_VSDPAYLOAD7)..... | 1632 |
| 33.5.99 | Frame Composer VSI Packet Data IEEE Register 8 (HDMI_FC_VSDPAYLOAD8)..... | 1632 |
| 33.5.100 | Frame Composer VSI Packet Data IEEE Register 9 (HDMI_FC_VSDPAYLOAD9)..... | 1633 |
| 33.5.101 | Frame Composer VSI Packet Data IEEE Register 10 (HDMI_FC_VSDPAYLOAD10)..... | 1633 |
| 33.5.102 | Frame Composer VSI Packet Data IEEE Register 11 (HDMI_FC_VSDPAYLOAD11)..... | 1634 |
| 33.5.103 | Frame Composer VSI Packet Data IEEE Register 12 (HDMI_FC_VSDPAYLOAD12)..... | 1634 |
| 33.5.104 | Frame Composer VSI Packet Data IEEE Register 13 (HDMI_FC_VSDPAYLOAD13)..... | 1635 |
| 33.5.105 | Frame Composer VSI Packet Data IEEE Register 14 (HDMI_FC_VSDPAYLOAD14)..... | 1635 |

| Section number | Title | Page |
|----------------|---|------|
| 33.5.106 | Frame Composer VSI Packet Data IEEE Register 15 (HDMI_FC_VSDPAYLOAD15)..... | 1636 |
| 33.5.107 | Frame Composer VSI Packet Data IEEE Register 16 (HDMI_FC_VSDPAYLOAD16)..... | 1636 |
| 33.5.108 | Frame Composer VSI Packet Data IEEE Register 17 (HDMI_FC_VSDPAYLOAD17)..... | 1637 |
| 33.5.109 | Frame Composer VSI Packet Data IEEE Register 18 (HDMI_FC_VSDPAYLOAD18)..... | 1637 |
| 33.5.110 | Frame Composer VSI Packet Data IEEE Register 19 (HDMI_FC_VSDPAYLOAD19)..... | 1638 |
| 33.5.111 | Frame Composer VSI Packet Data IEEE Register 20 (HDMI_FC_VSDPAYLOAD20)..... | 1638 |
| 33.5.112 | Frame Composer VSI Packet Data IEEE Register 21 (HDMI_FC_VSDPAYLOAD21)..... | 1639 |
| 33.5.113 | Frame Composer VSI Packet Data IEEE Register 22 (HDMI_FC_VSDPAYLOAD22)..... | 1639 |
| 33.5.114 | Frame Composer VSI Packet Data IEEE Register 23 (HDMI_FC_VSDPAYLOAD23)..... | 1640 |
| 33.5.115 | Frame Composer SPD Packet Data Vendor Name Register 0 (HDMI_FC_SPDVENDORNAME0)..... | 1640 |
| 33.5.116 | Frame Composer SPD Packet Data Product Name Register 0 (HDMI_FC_SPDPRODUCTNAME0)... | 1641 |
| 33.5.117 | Frame Composer SPD Packet Data Source Product Descriptor Register (HDMI_FC_SPDDEVICEINF)..... | 1641 |
| 33.5.118 | Frame Composer Audio Sample Flat and Layout Configuration Register (HDMI_FC_AUDSCONF)... | 1642 |
| 33.5.119 | Frame Composer Audio Packet Sample Present Status Register (HDMI_FC_AUDSSTAT)..... | 1642 |
| 33.5.120 | Frame Composer Number of High Priority Packets Attended Configuration Register (HDMI_FC_CTRLQHIG)..... | 1643 |
| 33.5.121 | Frame Composer Number of Low Priority Packets Attended Configuration Register (HDMI_FC_CTRLQLOW)..... | 1644 |
| 33.5.122 | Frame Composer ACP Packet Type Configuration Register 0 (HDMI_FC_ACP0)..... | 1644 |
| 33.5.123 | Frame Composer ACP Packet Type Configuration Register 1 (HDMI_FC_ACP1)..... | 1645 |
| 33.5.124 | FC_ISCR1_Frame Composer Packet Status, Valid, and Continue Configuration Register (HDMI_FC_ISCR1_0)..... | 1645 |
| 33.5.125 | Frame Composer ISCR1 Packet Body Register 1 (HDMI_FC_ISCR1_1)..... | 1646 |
| 33.5.126 | Frame Composer ISCR2 Packet Body Register 0 (HDMI_FC_ISCR2_0)..... | 1647 |
| 33.5.127 | Frame Composer Data Island Auto Packet Scheduling Register 0 (HDMI_FC_DATAUTO0)..... | 1647 |
| 33.5.128 | Frame Composer Data Island Auto Packet Scheduling Register 1 (HDMI_FC_DATAUTO1)..... | 1648 |
| 33.5.129 | Frame Composer Data Island Auto Packet Scheduling Register 2 (HDMI_FC_DATAUTO2)..... | 1649 |
| 33.5.130 | Frame Composer Data Island Manual Packet Request Register (HDMI_FC_DATMAN)..... | 1649 |
| 33.5.131 | Frame Composer Data Island Auto Packet Scheduling Register 3 (HDMI_FC_DATAUTO3)..... | 1650 |

| Section number | Title | Page |

Chapter 34

HDMI 3D Tx PHY (HDMI_PHY)

| | | |
|------------|---|------|
| 34.1 | Overview..... | 1779 |
| 34.1.1 | General Description..... | 1779 |
| 34.1.2 | Applications..... | 1779 |
| 34.1.3 | Standards Compliance..... | 1780 |
| 34.1.4 | Features..... | 1780 |
| 34.1.5 | HDMI 3D Tx PHY System-Level Overview..... | 1781 |
| 34.1.5.1 | System-Level Block Diagram..... | 1781 |
| 34.1.5.2 | HDMI 3D Tx PHY..... | 1781 |
| 34.1.5.2.1 | Interfaces..... | 1782 |
| 34.1.5.3 | HDMI 1.4 I/O Pads..... | 1782 |
| 34.1.5.3.1 | I/O Pads Description..... | 1782 |
| 34.2 | External Signals..... | 1783 |
| 34.2.1 | Top-Level I/O Diagram..... | 1784 |
| 34.2.2 | Top -Level Signal Descriptions..... | 1785 |
| 34.2.2.1 | TMDS Interface..... | 1786 |
| 34.2.2.2 | Reset Signals..... | 1786 |

| Section number | Title | Page |
|----------------|--|------|
| 34.2.2.3 | External Component..... | 1787 |
| 34.3 | Functional Description..... | 1787 |
| 34.3.1 | Functional Overview..... | 1787 |
| 34.3.2 | Operating Modes..... | 1789 |
| 34.3.2.1 | Power-Down Mode..... | 1790 |
| 34.3.2.2 | Active Mode..... | 1791 |
| 34.3.2.2.1 | Wide Interface Mode..... | 1793 |
| 34.3.2.3 | Power Sequence..... | 1793 |
| 34.3.2.3.1 | PLL/MPLL..... | 1796 |
| 34.3.2.3.2 | Resistor, ADC Calibration..... | 1798 |
| 34.3.2.3.3 | Clock Alignment..... | 1800 |
| 34.3.2.4 | Color Depth and Color Mode Selection..... | 1801 |
| 34.3.2.4.1 | Pixel Repetition Clock Generation Selection..... | 1801 |
| 34.3.3 | Configuration and Test Mode..... | 1801 |
| 34.3.3.1 | Power-Up Configuration..... | 1802 |
| 34.4 | System-Level Implementation..... | 1805 |
| 34.4.1 | System Operation..... | 1805 |
| 34.4.1.1 | Powering Up and Powering Down..... | 1805 |
| 34.4.1.2 | Active Mode Requirements..... | 1807 |
| 34.4.1.3 | Power-Up Requirements..... | 1807 |
| 34.4.1.4 | Power Supply Sequence When the HDMI 3D Tx PHY is Not Used..... | 1807 |
| 34.4.1.5 | Power-Down Requirements..... | 1807 |
| 34.5 | Reference Clock..... | 1807 |
| 34.6 | Control Registers..... | 1808 |
| 34.6.1 | Control Registers Module Design Architecture..... | 1808 |
| 34.7 | HDMI_PHY Memory Map/Register Definition..... | 1808 |
| 34.7.1 | Power Control (HDMI_PHY_PWRCTRL)..... | 1810 |
| 34.7.2 | Serializer Divider Control (HDMI_PHY_SERDIVCTRL)..... | 1812 |
| 34.7.3 | Serializer Clock Control (HDMI_PHY_SERCKCTRL)..... | 1812 |

| Section number | Title | Page |
|----------------|---|------|
| 34.7.4 | Serializer Clock Kill Control (HDMI_PHY_SERCKKILLCTRL)..... | 1813 |
| 34.7.5 | Transmitter and Resistance Calibration Control (HDMI_PHY_TXRESCTRL)..... | 1814 |
| 34.7.6 | Clock Calibration Control (HDMI_PHY_CKCALCTRL)..... | 1815 |
| 34.7.7 | Color Depth, Pixel Repetition, Clock Divider for PLL and MPLL, and Edge Rate Control (HDMI_PHY_CPCE_CTRL)..... | 1816 |
| 34.7.8 | Tx and Clock Measure Control (HDMI_PHY_TXCLKMEASCTRL)..... | 1818 |
| 34.7.9 | Tx Measure Control (HDMI_PHY_TXMEASCTRL)..... | 1819 |
| 34.7.10 | Clock Symbol and Transmitter Control (HDMI_PHY_CKSYMTXCTRL)..... | 1821 |
| 34.7.11 | Comparator Sequence Control (HDMI_PHY_CMPSEQCTRL)..... | 1822 |
| 34.7.12 | Comparator Power Control (HDMI_PHY_CMPPWRCTRL)..... | 1822 |
| 34.7.13 | Comparator Mode Control (HDMI_PHY_CMPMODECTRL)..... | 1823 |
| 34.7.14 | Measure Control (HDMI_PHY_MEASCTRL)..... | 1824 |
| 34.7.15 | Voltage Level Control (HDMI_PHY_VLEVCTRL)..... | 1825 |
| 34.7.16 | Digital-to-Analog Control (HDMI_PHY_D2ACTRL)..... | 1826 |
| 34.7.17 | Current Control (HDMI_PHY_CURRCTRL)..... | 1826 |

Chapter 35 I2C Controller (I2C)

| | | |
|--------|-------------------------------|------|
| 35.1 | Overview..... | 1867 |
| 35.1.1 | Features..... | 1869 |
| 35.1.2 | Modes and operations..... | 1870 |
| 35.2 | External Signals..... | 1870 |
| 35.3 | Clocks..... | 1871 |
| 35.4 | Functional description..... | 1871 |
| 35.4.1 | I2C system configuration..... | 1871 |
| 35.4.2 | Arbitration procedure..... | 1872 |
| 35.4.3 | Clock synchronization..... | 1872 |
| 35.4.4 | Handshaking..... | 1873 |
| 35.4.5 | Clock stretching..... | 1873 |
| 35.4.6 | Peripheral bus accesses..... | 1874 |

| Section number | Title | Page |
|----------------|---|------|
| 35.4.7 | Generation of transfer error on IP bus..... | 1874 |
| 35.4.8 | Reset..... | 1874 |
| 35.4.9 | Interrupts..... | 1874 |
| 35.4.10 | Byte order..... | 1874 |
| 35.5 | Initialization..... | 1875 |
| 35.5.1 | Initialization sequence..... | 1875 |
| 35.5.2 | Generation of Start..... | 1875 |
| 35.5.3 | Post-transfer software response..... | 1875 |
| 35.5.4 | Generation of Stop..... | 1876 |
| 35.5.5 | Generation of Repeated Start..... | 1876 |
| 35.5.6 | Slave mode..... | 1877 |
| 35.5.7 | Arbitration lost..... | 1877 |
| 35.6 | Software restriction..... | 1883 |
| 35.7 | I2C Memory Map/Register Definition..... | 1884 |
| 35.7.1 | I2C Address Register (I2Cx_IADR)..... | 1885 |
| 35.7.2 | I2C Frequency Divider Register (I2Cx_IFDR)..... | 1885 |
| 35.7.3 | I2C Control Register (I2Cx_I2CR)..... | 1887 |
| 35.7.4 | I2C Status Register (I2Cx_I2SR)..... | 1888 |
| 35.7.5 | I2C Data I/O Register (I2Cx_I2DR)..... | 1890 |

Chapter 36 IOMUX Controller (IOMUXC)

| | | |
|--------|---|------|
| 36.1 | Overview..... | 1891 |
| 36.1.1 | Features..... | 1892 |
| 36.2 | Clocks..... | 1893 |
| 36.3 | Functional description..... | 1893 |
| 36.3.1 | ALT6 and ALT7 extended muxing modes..... | 1894 |
| 36.3.2 | SW Loopback through SION bit..... | 1895 |
| 36.3.3 | Daisy chain - multi pads driving same module input pin..... | 1895 |

| Section number | Title | Page |
|----------------|--|------|
| 36.4 | IOMUXC Memory Map/Register Definition..... | 1896 |
| 36.4.1 | GPR (IOMUXC_GPR0)..... | 1924 |
| 36.4.2 | GPR (IOMUXC_GPR1)..... | 1927 |
| 36.4.3 | GPR (IOMUXC_GPR2)..... | 1930 |
| 36.4.4 | GPR (IOMUXC_GPR3)..... | 1932 |
| 36.4.5 | GPR (IOMUXC_GPR4)..... | 1936 |
| 36.4.6 | GPR (IOMUXC_GPR5)..... | 1939 |
| 36.4.7 | GPR (IOMUXC_GPR6)..... | 1940 |
| 36.4.8 | GPR (IOMUXC_GPR7)..... | 1941 |
| 36.4.9 | GPR (IOMUXC_GPR8)..... | 1942 |
| 36.4.10 | GPR (IOMUXC_GPR9)..... | 1943 |
| 36.4.11 | GPR (IOMUXC_GPR10)..... | 1944 |
| 36.4.12 | GPR (IOMUXC_GPR11)..... | 1946 |
| 36.4.13 | GPR (IOMUXC_GPR12)..... | 1946 |
| 36.4.14 | GPR (IOMUXC_GPR13)..... | 1948 |
| 36.4.15 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_SD2_DATA1)..... | 1951 |
| 36.4.16 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_SD2_DATA2)..... | 1952 |
| 36.4.17 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_SD2_DATA0)..... | 1953 |
| 36.4.18 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_TXC)..... | 1954 |
| 36.4.19 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_TD0)..... | 1955 |
| 36.4.20 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_TD1)..... | 1956 |
| 36.4.21 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_TD2)..... | 1957 |
| 36.4.22 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_TD3)..... | 1958 |
| 36.4.23 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_RX_CTL)..... | 1959 |
| 36.4.24 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_RD0)..... | 1960 |
| 36.4.25 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_TX_CTL)..... | 1961 |
| 36.4.26 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_RD1)..... | 1962 |
| 36.4.27 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_RD2)..... | 1963 |
| 36.4.28 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_RD3)..... | 1964 |

| Section number | Title | Page |
|----------------|--|------|
| 36.4.29 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_RXC)..... | 1965 |
| 36.4.30 | Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_ADDR25)..... | 1966 |

Chapter 37

Image Processing Unit (IPU)

| | | |
|--------------|---|------|
| 37.1 | Overview..... | 2691 |
| 37.1.1 | Architecture..... | 2692 |
| 37.1.2 | Features And Functionality..... | 2693 |
| 37.1.2.1 | External Ports..... | 2693 |
| 37.1.2.1.1 | Camera Ports..... | 2693 |
| 37.1.2.1.2 | Display Ports..... | 2697 |
| 37.1.2.1.2.1 | Access Modes..... | 2697 |
| 37.1.2.1.2.2 | Display Interface..... | 2699 |
| 37.1.2.1.3 | Memory Port..... | 2702 |
| 37.1.2.1.4 | Processing..... | 2704 |
| 37.1.2.1.4.1 | Processing flows..... | 2704 |
| 37.1.2.1.4.2 | Display Processor (DP)..... | 2706 |
| 37.1.2.1.5 | Video De-Interlacer or Combiner (VDIC)..... | 2707 |
| 37.1.2.1.5.1 | De-interlacing in the VDIC..... | 2707 |
| 37.1.2.1.5.2 | Combining in the VDIC..... | 2708 |
| 37.1.2.1.5.3 | Image Converter (IC)..... | 2708 |

| Section number | Title | Page |
|----------------|---|------|
| | 37.1.2.1.5.4 Image Rotator (IRT)..... | 2709 |
| 37.1.2.1.6 | Automatic Procedures..... | 2709 |
| | 37.1.2.1.6.1 Screen Refresh..... | 2710 |
| | 37.1.2.1.6.2 Update Of The Display Buffer..... | 2710 |
| | 37.1.2.1.6.3 Camera Preview..... | 2711 |
| 37.2 | External Signals..... | 2711 |
| 37.3 | Clocks..... | 2716 |
| 37.4 | Functional Description..... | 2717 |
| 37.4.1 | IPU detailed block diagram..... | 2717 |
| 37.4.2 | Image DMA Controller (IDMAC)..... | 2719 |
| | 37.4.2.1 IDMAC's channels | 2721 |
| | 37.4.2.2 IBIW & IBIR - Internal bus interface for write and read..... | 2723 |
| | 37.4.2.3 FCW & FCR - Format converter write and read..... | 2723 |
| | 37.4.2.4 Buffering units..... | 2726 |
| | 37.4.2.4.1 Handling real time channels..... | 2727 |
| | 37.4.2.5 AXIW - AXI Write and AXIR - AXI Read..... | 2727 |
| | 37.4.2.6 CC_W & CC_R - Channel Control Write and Read..... | 2727 |
| | 37.4.2.6.1 Locking the arbitration and reordering the AXI bursts..... | 2728 |
| | 37.4.2.7 AAU_W & AAU_R- Address Arithmetic Unit for Write and Read..... | 2729 |
| | 37.4.2.7.1 Scrolling support..... | 2731 |
| | 37.4.2.8 ATC - Alpha Transparency Controller..... | 2731 |
| | 37.4.2.8.1 Conditional read..... | 2733 |
| | 37.4.2.9 LUT- Look Up Table..... | 2733 |
| | 37.4.2.10 CPMEM - Channel Parameter Memory..... | 2734 |
| | 37.4.2.10.1 CPMEM's words' structure for non interleaved mode..... | 2735 |
| | 37.4.2.10.2 CPMEM's words' structure for interleaved mode..... | 2740 |
| | 37.4.2.10.3 Accessing the CPMEM for programming..... | 2749 |
| | 37.4.2.10.4 Alternate IDMAC settings..... | 2750 |

| Section number | Title | Page |
|----------------|---|------|
| 37.4.2.11 | IDMAC's modes of operation..... | 2750 |
| 37.4.2.11.1 | Rotation modes..... | 2750 |
| 37.4.2.11.2 | Frame size..... | 2751 |
| 37.4.2.12 | IDMAC's restriction..... | 2753 |
| 37.4.2.13 | IDMAC's Endianness support..... | 2753 |
| 37.4.2.14 | IDMAC's internal events..... | 2754 |
| 37.4.3 | Camera Sensor Interface (CSI) | 2754 |
| 37.4.3.1 | CSI Block Diagram | 2754 |
| 37.4.3.2 | CSI Interface | 2755 |
| 37.4.3.2.1 | Parallel Interface | 2755 |
| 37.4.3.2.2 | High-speed serial interface - MIPI (Mobile Industry Processor Interface). . | 2756 |
| 37.4.3.3 | Test Mode | 2756 |
| 37.4.3.4 | Sensor Image Frame Relations | 2757 |
| 37.4.3.5 | Companding | 2758 |
| 37.4.3.6 | Timing/Data mode protocols | 2759 |
| 37.4.3.6.1 | Gated Mode | 2759 |
| 37.4.3.6.2 | Non-Gated Mode | 2759 |
| 37.4.3.6.3 | BT.656 mode | 2760 |
| 37.4.3.6.4 | BT.1120 mode | 2760 |
| 37.4.3.7 | Packing to memory | 2761 |
| 37.4.3.8 | Skipping frames | 2762 |
| 37.4.3.9 | 16 bit camera support..... | 2762 |
| 37.4.3.10 | CSI Restrictions | 2763 |
| 37.4.4 | Sensor Multi FIFO Controller (SMFC)..... | 2763 |
| 37.4.4.1 | SMFC's Features..... | 2764 |
| 37.4.4.2 | SMFC's Functional description..... | 2764 |
| 37.4.4.2.1 | SMFC Master interface..... | 2767 |
| 37.4.4.2.2 | Restrictions..... | 2768 |

| Section number | Title | Page |
|----------------|---------------------------------------|------|
| 37.4.5 | Image Converter | 2768 |
| 37.4.5.1 | IC Block Diagram..... | 2768 |
| 37.4.5.2 | Processing tasks..... | 2769 |
| 37.4.5.3 | Downsizing Section..... | 2770 |
| 37.4.5.4 | Main Processing Section..... | 2772 |
| 37.4.5.5 | Rotation Section..... | 2775 |
| 37.4.5.6 | IC Task Parameter Memory..... | 2777 |
| 37.4.5.7 | IC's DMA channels..... | 2782 |
| 37.4.5.8 | IC restrictions..... | 2782 |
| 37.4.5.9 | IC bridge..... | 2782 |
| 37.4.6 | Display port..... | 2783 |
| 37.4.6.1 | Display ports channels..... | 2784 |
| 37.4.6.2 | Supported display interfaces..... | 2785 |
| 37.4.6.2.1 | Synchronous Interfaces..... | 2785 |
| 37.4.6.2.2 | Asynchronous Parallel Interfaces..... | 2786 |
| 37.4.6.2.3 | Asynchronous Serial Interfaces..... | 2786 |
| 37.4.6.3 | Display port's bandwidth..... | 2786 |
| 37.4.6.4 | Display Dual Mode..... | 2787 |
| 37.4.6.5 | Display Errors | 2787 |
| 37.4.6.5.1 | Data starvation errors..... | 2787 |
| 37.4.6.5.2 | Anti tearing errors..... | 2788 |
| 37.4.6.6 | Display port's restrictions..... | 2788 |
| 37.4.7 | DC - Display Controller..... | 2789 |
| 37.4.7.1 | Channels flow control..... | 2791 |
| 37.4.7.1.1 | New Frame control..... | 2791 |
| 37.4.7.1.2 | Antitearing control..... | 2791 |
| 37.4.7.1.3 | User command mode control..... | 2792 |
| 37.4.7.2 | Arbitration Unit..... | 2792 |
| 37.4.7.2.1 | Access request generator..... | 2792 |

| Section number | Title | Page |
|----------------|---|------|
| | 37.4.7.2.2 DI arbiter..... | 2792 |
| | 37.4.7.2.3 Source arbiter..... | 2793 |
| 37.4.7.3 | Microcode processing unit..... | 2793 |
| | 37.4.7.3.1 Channels address control..... | 2793 |
| | 37.4.7.3.2 General purpose Data oriented events counters..... | 2793 |
| | 37.4.7.3.3 Microcode address generator..... | 2793 |
| | 37.4.7.3.4 Template's Memory Access Arbiter..... | 2794 |
| 37.4.7.4 | DC's Template structure..... | 2794 |
| | 37.4.7.4.1 DC template's memory map..... | 2795 |
| 37.4.7.5 | Display controls' generator..... | 2803 |
| | 37.4.7.5.1 Bus Mapping Unit..... | 2803 |
| 37.4.8 | DMFC - Display Multi FIFO Controller..... | 2809 |
| 37.4.8.1 | DP and DC read channels..... | 2810 |
| | 37.4.8.1.1 FIFO allocation to channels..... | 2810 |
| | 37.4.8.1.2 Arbitration between channels..... | 2811 |
| | 37.4.8.1.3 Watermark..... | 2811 |
| 37.4.8.2 | IC interface..... | 2812 |
| 37.4.8.3 | DC write channel and AHB accesses..... | 2812 |
| 37.4.9 | DP - Display Processor..... | 2812 |
| 37.4.9.1 | The DP programming model..... | 2813 |
| 37.4.9.2 | Displayed Planes..... | 2813 |
| 37.4.9.3 | Combining Unit..... | 2814 |
| 37.4.9.4 | Cursor Generator..... | 2815 |
| 37.4.9.5 | Color Space Conversion unit - CSC..... | 2815 |
| | 37.4.9.5.1 Gamut mapping..... | 2817 |
| 37.4.9.6 | Gamma correction..... | 2818 |
| 37.4.9.7 | DC interface..... | 2819 |
| 37.4.9.8 | DP's flows management..... | 2819 |
| 37.4.9.9 | DP debug unit..... | 2821 |

| Section number | Title | Page |
|----------------|---|------|
| 37.4.9.10 | Restriction..... | 2822 |
| 37.4.10 | Display Interface (DI)..... | 2822 |
| 37.4.10.1 | DC interface, data accumulator and clock domain synchronizer..... | 2824 |
| 37.4.10.2 | Parallel interface data synchronizer and data oriented interface..... | 2824 |
| 37.4.10.3 | Timing generator..... | 2824 |
| 37.4.10.3.1 | Waveform concatenation..... | 2826 |
| 37.4.10.3.2 | The basic counter..... | 2827 |
| 37.4.10.3.3 | Counter number 9..... | 2830 |
| 37.4.10.3.4 | DI's active window..... | 2830 |
| 37.4.10.4 | Waveform settings for asynchronous interface pins..... | 2831 |
| 37.4.10.5 | Serial display interface..... | 2833 |
| 37.4.10.5.1 | Waveform settings for serial interface pins..... | 2834 |
| 37.4.10.6 | Low Level Access - LLA..... | 2837 |
| 37.4.10.7 | Using a mask channel..... | 2837 |
| 37.4.11 | Video De Interlacing or Combining Block (VDIC)..... | 2837 |
| 37.4.11.1 | VDIC Features..... | 2840 |
| 37.4.11.2 | De interlacer (DI) sub-block | 2840 |
| 37.4.11.2.1 | Vertical Filter Block (di_vfilt) | 2840 |
| 37.4.11.2.2 | Motion Calculator Block (di_mcalc) | 2841 |
| 37.4.11.2.3 | Spatial Motion Filter (di_sfilt) | 2842 |
| 37.4.11.2.4 | Interpolated Pixel Calculator Block (di_interp) | 2842 |
| 37.4.11.2.5 | Median Filter Block (di_med) | 2842 |
| 37.4.11.2.6 | Soft Switch Block (di_sswitch) | 2842 |
| 37.4.11.3 | DMA only Mode | 2843 |
| 37.4.11.4 | Real Time Mode | 2843 |
| 37.4.11.5 | CSI only Mode | 2843 |
| 37.4.11.6 | Using Combining in the VDIC | 2843 |
| 37.4.11.7 | VDIC Restrictions | 2844 |

| Section number | Title | Page |
|----------------|---|------|
| 37.4.12 | Control Module (CM)..... | 2844 |
| 37.4.12.1 | Block Diagram..... | 2845 |
| 37.4.12.2 | Frame Synchronization Unit..... | 2846 |
| 37.4.12.2.1 | General Description..... | 2846 |
| 37.4.12.2.2 | Frame Synchronization Flow | 2846 |
| 37.4.12.2.3 | FSU's fundamentals..... | 2847 |
| 37.4.12.2.4 | IPU main flows..... | 2850 |
| 37.4.12.2.5 | Sub-Frame Double-Buffering (Band Mode)..... | 2858 |
| 37.4.12.2.6 | Automatic Window Refresh..... | 2859 |
| 37.4.12.2.7 | IPU VDOA synchronization..... | 2859 |
| 37.4.12.3 | Interrupt Generator..... | 2860 |
| 37.4.12.4 | SDMA event generator..... | 2866 |
| 37.4.12.5 | General Configuration Registers..... | 2867 |
| 37.4.12.6 | Shadow Registers Module (SRM)..... | 2867 |
| 37.4.12.6.1 | Switching between 2 flows..... | 2867 |
| 37.4.12.6.2 | Updating parameters between frames..... | 2867 |
| 37.4.12.6.3 | Updating the memory..... | 2868 |
| 37.4.12.6.4 | SRM priority..... | 2869 |
| 37.4.12.6.5 | SRM entries mapping..... | 2869 |
| 37.4.12.7 | Memory Access Unit..... | 2886 |
| 37.4.12.8 | SISG - Still Image Synchronization Generator..... | 2887 |
| 37.4.12.9 | Clock Change procedure..... | 2889 |
| 37.4.12.10 | Low Power Modes..... | 2890 |
| 37.4.12.10.1 | STOP Mode..... | 2891 |
| 37.4.12.10.2 | Low Power Screen Refresh mode - LPSR..... | 2892 |
| 37.4.13 | IPU diagnostics unit..... | 2894 |
| 37.5 | IPU Memory Map/Register Definition..... | 2898 |
| 37.5.1 | Configuration Register (IPUx_CONF)..... | 2935 |
| 37.5.2 | SISG Control 0 Register (IPUx_SISG_CTRL0)..... | 2938 |

| Section number | Title | Page |
|----------------|---|------|
| 37.5.3 | SISG Control 1 Register (IPU _x _SISG_CTRL1)..... | 2939 |
| 37.5.4 | SISG Set<i> Register (IPU _x _SISG_SET_i)..... | 2940 |
| 37.5.5 | SISG Clear <i> Register (IPU _x _SISG_CLR_i)..... | 2940 |
| 37.5.6 | Interrupt Control Register 1 (IPU _x _INT_CTRL_1)..... | 2941 |

| Chapter 38 | | |
| Keypad Port (KPP) | | |
| 38.1 | Overview | 3517 |
| 38.1.1 | Features..... | 3519 |
| 38.1.2 | Modes and Operations..... | 3519 |
| 38.2 | Clocks..... | 3519 |
| 38.3 | External Signals..... | 3519 |
| 38.3.1 | Input Pins..... | 3521 |
| 38.3.2 | Output Pins..... | 3521 |
| 38.3.3 | Generation of Transfer Error Signal on Peripheral Bus..... | 3521 |
| 38.4 | Functional Description..... | 3522 |
| 38.4.1 | Keypad Matrix Construction..... | 3522 |
| 38.4.2 | Keypad Port Configuration..... | 3522 |
| 38.4.3 | Keypad Matrix Scanning..... | 3522 |
| 38.4.4 | Keypad Standby..... | 3523 |
| 38.4.5 | Glitch Suppression on Keypad Inputs..... | 3523 |
| 38.4.6 | Multiple Key Closures..... | 3525 |
| 38.4.6.1 | Ghost Key Problem and Correction..... | 3527 |
| 38.4.7 | 3-Point Contact Keys Support..... | 3529 |
| 38.5 | Initialization/Application Information..... | 3530 |
| 38.5.1 | Typical Keypad Configuration and Scanning Sequence..... | 3531 |
| 38.5.2 | Key Press Interrupt Scanning Sequence..... | 3531 |
| 38.5.3 | Additional Comments..... | 3531 |
| 38.6 | KPP Memory Map/Register Definition..... | 3532 |
| 38.6.1 | Keypad Control Register (KPP_KPCR)..... | 3532 |
| 38.6.2 | Keypad Status Register (KPP_KPSR)..... | 3533 |
| 38.6.3 | Keypad Data Direction Register (KPP_KDDR)..... | 3535 |
| 38.6.4 | Keypad Data Register (KPP_KPDR)..... | 3535 |

Chapter 39

LVDS Display Bridge (LDB)

| | | |
|--------|---|------|
| 39.1 | Overview..... | 3537 |
| 39.1.1 | Relevant Standards..... | 3539 |
| 39.2 | External Signals..... | 3539 |
| 39.3 | Clocks..... | 3540 |
| 39.4 | Input and Output Ports..... | 3540 |
| 39.4.1 | Input Parallel Display Ports..... | 3540 |
| 39.4.2 | Output LVDS Ports..... | 3541 |
| 39.5 | Processing..... | 3541 |
| 39.5.1 | Mapping of Input Data Busses..... | 3542 |
| 39.5.2 | Bit Mapping..... | 3542 |
| 39.6 | LDB Memory Map/Register Definition..... | 3543 |
| 39.6.1 | LDB Control Register (LDB_CTRL)..... | 3543 |

Chapter 40

MIPI - Camera Serial Interface Host Controller (MIPI_CSI)

| | | |
|--------|---------------------------------------|------|
| 40.1 | Overview..... | 3547 |
| 40.2 | Features..... | 3547 |
| 40.3 | Architecture..... | 3548 |
| 40.3.1 | Startup Sequence..... | 3549 |
| 40.3.2 | Interrupt mechanism..... | 3551 |
| 40.3.3 | Signals..... | 3552 |
| 40.4 | Timing Interfaces..... | 3553 |
| 40.4.1 | Image Data Interface..... | 3553 |
| 40.5 | Payload Data Output Format..... | 3558 |
| 40.5.1 | General/Arbitrary Data Reception..... | 3558 |
| 40.5.2 | RGB888 Data Reception..... | 3559 |
| 40.5.3 | RGB666 Data Reception..... | 3560 |
| 40.5.4 | RGB565 Data Reception..... | 3561 |

| Section number | Title | Page |
|----------------|---|------|
| 40.5.5 | RGB555 Data Reception..... | 3562 |
| 40.5.6 | RGB444 Data Reception..... | 3563 |
| 40.5.7 | YUV422 8-bit Data Reception..... | 3563 |
| 40.5.8 | YUV422 10-bit Data Reception..... | 3564 |
| 40.5.9 | YUV420 8-bit (Legacy) Data Reception..... | 3565 |
| 40.5.10 | YUV420 8-bit Data Reception..... | 3566 |
| 40.5.11 | YUV420 10-bit Data Reception..... | 3567 |
| 40.5.12 | RAW6 Data Reception..... | 3569 |
| 40.5.13 | RAW7 Data Reception..... | 3569 |
| 40.5.14 | RAW8 Data Reception..... | 3570 |
| 40.5.15 | RAW10 Data Reception..... | 3570 |
| 40.5.16 | RAW12 Data Reception..... | 3571 |
| 40.5.17 | RAW14 Data Reception..... | 3572 |
| 40.6 | MIPI_CSI Memory Map/Register Definition..... | 3573 |
| 40.6.1 | Controller Version Identification Register (MIPI_CSI_VERSION)..... | 3574 |
| 40.6.2 | Number of Active Data Lanes (MIPI_CSI_N_LANES)..... | 3575 |
| 40.6.3 | Phy shutdown control (MIPI_CSI_PHY_SHUTDOWNZ)..... | 3575 |
| 40.6.4 | Phy reset control (MIPI_CSI_DPHY_RSTZ)..... | 3576 |
| 40.6.5 | CSI2 controller reset (MIPI_CSI_CSI2_RESETN)..... | 3577 |
| 40.6.6 | General settings for all blocks (MIPI_CSI_PHY_STATE)..... | 3578 |
| 40.6.7 | Data IDs for which IDI reports line boundary matching errors (MIPI_CSI_DATA_IDS_1)..... | 3579 |
| 40.6.8 | Data IDs for which IDI reports line boundary matching errors (MIPI_CSI_DATA_IDS_2)..... | 3580 |
| 40.6.9 | Error state register 1 (MIPI_CSI_ERR1)..... | 3582 |
| 40.6.10 | Error state register 2 (MIPI_CSI_ERR2)..... | 3586 |
| 40.6.11 | Masks for errors 1 (MIPI_CSI_MASK1)..... | 3589 |
| 40.6.12 | Masks for errors 2 (MIPI_CSI_MASK2)..... | 3591 |
| 40.6.13 | D-PHY Test interface control 0 (MIPI_CSI_PHY_TST_CTRL0)..... | 3593 |
| 40.6.14 | D-PHY Test interface control 1 (MIPI_CSI_PHY_TST_CTRL1)..... | 3594 |

| Chapter 41 | | |
| MIPI DSI Host Controller (MIPI_DSI) | | |
| 41.1 | Overview..... | 3597 |
| 41.2 | Features..... | 3597 |
| 41.2.1 | System Overview..... | 3598 |
| 41.3 | Clocks..... | 3598 |
| 41.4 | Architecture..... | 3599 |
| 41.4.1 | Architecture Overview..... | 3599 |
| 41.4.2 | DBI-2 interface..... | 3600 |
| 41.4.3 | DPI-2 Interface..... | 3617 |
| 41.4.4 | Error control and timeout timers..... | 3619 |
| 41.4.5 | Timeout timers | 3619 |
| 41.4.6 | Error control..... | 3619 |
| 41.4.7 | Generic packets | 3621 |
| 41.4.8 | Signals..... | 3622 |
| 41.5 | Programming..... | 3623 |
| 41.5.1 | DSI and D-PHY initialization sequence..... | 3623 |
| 41.6 | MIPI_DSI Memory Map/Register Definition..... | 3624 |
| 41.6.1 | Version of the DSI host ctrl (MIPI_DSI_VERSION)..... | 3626 |
| 41.6.2 | Core power up (MIPI_DSI_PWR_UP)..... | 3626 |
| 41.6.3 | Number of active data lanes (MIPI_DSI_CLKMGR_CFG)..... | 3627 |
| 41.6.4 | DPI interface configuration (MIPI_DSI_DPI_CFG)..... | 3628 |
| 41.6.5 | DBI interface configuration (MIPI_DSI_DBI_CFG)..... | 3629 |
| 41.6.6 | DBI command size configuration (MIPI_DSI_DBIS_CMDSIZE)..... | 3630 |
| 41.6.7 | Packet handler configuration (MIPI_DSI_PCKHDL_CFG)..... | 3631 |
| 41.6.8 | Video Mode Configuration (MIPI_DSI_VID_MODE_CFG)..... | 3632 |
| 41.6.9 | Video packet configuration (MIPI_DSI_VID_PKT_CFG)..... | 3633 |
| 41.6.10 | Command mode configuration (MIPI_DSI_CMD_MODE_CFG)..... | 3634 |
| 41.6.11 | Line timer configuration (MIPI_DSI_TMR_LINE_CFG)..... | 3636 |

| Section number | Title | Page |
|----------------|---|------|
| 41.6.12 | Vertical timing configuration (MIPI_DSI_VTIMING_CFG)..... | 3637 |
| 41.6.13 | D-PHY timing configuration (MIPI_DSI_PHY_TMR_CFG)..... | 3637 |
| 41.6.14 | Generic packet Header configuration (MIPI_DSI_GEN_HDR)..... | 3638 |
| 41.6.15 | Generic payload data in/out (MIPI_DSI_GEN_PLD_DATA)..... | 3638 |
| 41.6.16 | Command packet status (MIPI_DSI_CMD_PKT_STATUS)..... | 3639 |
| 41.6.17 | Time Out timers configuration (MIPI_DSI_TO_CNT_CFG0)..... | 3640 |
| 41.6.18 | Interrupt status register 0 (MIPI_DSI_ERROR_ST0)..... | 3641 |
| 41.6.19 | Interrupt status register 1 (MIPI_DSI_ERROR_ST1)..... | 3642 |
| 41.6.20 | Masks Interrupt generation triggered by ERROR_ST0 register (MIPI_DSI_ERROR_MSK0)..... | 3644 |
| 41.6.21 | Masks Interrupt generation triggered by ERROR_ST1 register (MIPI_DSI_ERROR_MSK1)..... | 3646 |
| 41.6.22 | D-PHY reset control (MIPI_DSI_PHY_RSTZ)..... | 3647 |
| 41.6.23 | D-PHY interface configuration (MIPI_DSI_PHY_IF_CFG_)..... | 3648 |
| 41.6.24 | D-PHY PPI interface control (MIPI_DSI_PHY_IF_CTRL)..... | 3649 |
| 41.6.25 | D-PHY PPI status interface (MIPI_DSI_PHY_STATUS)..... | 3650 |
| 41.6.26 | D-PHY Test interface control 0 (MIPI_DSI_PHY_TST_CTRL0)..... | 3651 |
| 41.6.27 | D-PHY Test interface control 1 (MIPI_DSI_PHY_TST_CTRL1)..... | 3652 |

Chapter 42

MIPI HSI Host Controller (MIPI_HSI)

| | | |
|----------|---|------|
| 42.1 | Overview..... | 3655 |
| 42.1.1 | Features..... | 3655 |
| 42.2 | External Signals..... | 3656 |
| 42.2.1 | External Signals Overview..... | 3656 |
| 42.2.2 | Ports Table..... | 3657 |
| 42.3 | Clocks..... | 3657 |
| 42.4 | Functional Description..... | 3657 |
| 42.4.1 | DMA AHB /PIO AHB slave and Data Channel Buffer..... | 3658 |
| 42.4.1.1 | AHB Slave Interface..... | 3659 |
| 42.4.1.2 | AHB Master Interface..... | 3660 |
| 42.4.1.3 | Control Registers..... | 3660 |

| Section number | Title | Page |
|----------------|---|------|
| 42.4.1.4 | DMA Engine..... | 3660 |
| 42.4.1.5 | Rx/Tx FIFO controller..... | 3660 |
| 42.4.1.6 | Arbiter..... | 3660 |
| 42.4.1.7 | 4K Bytes Dual Port RAM..... | 3660 |
| 42.4.1.8 | Typical Software Operation Flow for DMA..... | 3660 |
| 42.4.1.9 | Typical Software Operation Flow 1 for Data Port..... | 3661 |
| 42.4.1.10 | Typical Software Operation Flow 2 for Data Port..... | 3661 |
| 42.4.2 | HSI Reset..... | 3661 |
| 42.5 | HSI Memory Map/Register Definition..... | 3661 |
| 42.5.1 | HSI Control Register (MIPI_HSI_CTRL)..... | 3668 |

| 43.6.23 | MIF Data Write Enable 1 Register (MLB150_MDWE1)..... | 3804 |
| 43.6.24 | MIF Data Write Enable 2 Register (MLB150_MDWE2)..... | 3805 |
| 43.6.25 | MIF Data Write Enable 3 Register (MLB150_MDWE3)..... | 3805 |
| 43.6.26 | MIF Control Register (MLB150_MCTL)..... | 3806 |
| 43.6.27 | MIF Address Register (MLB150_MADR)..... | 3806 |
| 43.6.28 | AHB Control Register (MLB150_ACTL)..... | 3807 |
| 43.6.29 | AHB Channel Status 0 Register (MLB150_ACSR0)..... | 3808 |
| 43.6.30 | AHB Channel Status 1 Register (MLB150_ACSR1)..... | 3809 |
| 43.6.31 | AHB Channel Mask 0 Register (MLB150_ACMR0)..... | 3809 |
| 43.6.32 | AHB Channel Mask 1 Register (MLB150_ACMR1)..... | 3810 |

Chapter 44 Multi Mode DDR Controller (MMDC)

| | | |
|--------|---------------------------|------|
| 44.1 | Overview..... | 3811 |
| 44.1.1 | MMDC feature summary..... | 3813 |
| 44.2 | External Signals..... | 3815 |
| 44.3 | Clocks..... | 3816 |

| Section number | Title | Page |
|----------------|--|------|
| 44.4 | Functional Description..... | 3816 |
| 44.4.1 | Write/Read data flow..... | 3816 |
| 44.4.1.1 | Write data flow..... | 3816 |
| 44.4.1.2 | Read data flow..... | 3817 |
| 44.4.2 | MMDC initialization | 3818 |
| 44.4.3 | Configuring the MMDC registers..... | 3819 |
| 44.4.4 | MMDC Address Space..... | 3819 |
| 44.4.4.1 | Address decoding | 3820 |
| 44.4.4.2 | Chip select settings..... | 3822 |
| 44.4.4.2.1 | Creating 4 Gbyte address space with 2 Gbyte CS density..... | 3822 |
| 44.4.4.2.2 | Creating 2 Gbyte address spaces with 1 Gbyte CS density..... | 3823 |
| 44.4.4.3 | Translation of AXI accesses to DDR accessess..... | 3824 |
| 44.4.4.3.1 | Example 1..... | 3824 |
| 44.4.4.3.2 | Example 2..... | 3825 |
| 44.4.4.3.3 | Example 3..... | 3826 |
| 44.4.4.3.4 | Example 4..... | 3826 |
| 44.4.4.3.5 | Example 5 | 3827 |
| 44.4.4.4 | Address mirroring | 3827 |
| 44.4.5 | LPDDR2 and DDR3 pin mux mapping..... | 3828 |
| 44.4.6 | Power Saving and Clock Frequency Change modes..... | 3829 |
| 44.4.6.1 | Power saving general..... | 3829 |
| 44.4.6.2 | Self refresh and Frequency change entry/exit..... | 3831 |
| 44.4.7 | Reset | 3832 |
| 44.4.7.1 | Hard reset..... | 3832 |
| 44.4.7.2 | Warm reset..... | 3832 |
| 44.4.7.3 | Software reset | 3833 |
| 44.4.8 | Refresh Scheme..... | 3833 |
| 44.4.9 | Burst Length options towards DDR | 3834 |
| 44.4.10 | Exclusive accesses handling..... | 3835 |

| Section number | Title | Page |
|----------------|--|------|
| 44.4.11 | AXI Error Handling..... | 3836 |
| 44.5 | Performance..... | 3836 |
| 44.5.1 | Arbitration and reordering mechanism..... | 3836 |
| 44.5.1.1 | Arbitration General..... | 3836 |
| 44.5.1.2 | Real time channel mode..... | 3837 |
| 44.5.1.3 | Dynamic scoring mode (Arbitration Winning Conditions)..... | 3837 |
| 44.5.1.4 | Guarding (aging) mechanism..... | 3838 |
| 44.5.2 | Prediction mechanism..... | 3839 |
| 44.5.3 | Special Optimization for accesses towards DDR3..... | 3839 |
| 44.6 | MMDC Debug | 3840 |
| 44.6.1 | Hardware debug monitor..... | 3840 |
| 44.6.2 | Step By Step (SBS) software monitor..... | 3841 |
| 44.7 | MMDC Profiling..... | 3841 |
| 44.8 | LPDDR2 Refresh Rate Update and Timing Derating..... | 3843 |
| 44.9 | DLL Off mode..... | 3844 |
| 44.10 | ODT Configuration | 3845 |
| 44.11 | Calibration Process..... | 3846 |
| 44.11.1 | delay-line..... | 3847 |
| 44.11.2 | ZQ calibration | 3848 |
| 44.11.2.1 | ZQ automatic (hardware) calibration process..... | 3849 |
| 44.11.2.1.1 | ZQ automatic Pull-up calibration..... | 3849 |
| 44.11.2.1.2 | ZQ automatic Pull-down calibration..... | 3850 |
| 44.11.2.2 | ZQ software calibration process..... | 3850 |
| 44.11.2.3 | ZQ calibration commands | 3850 |
| 44.11.3 | Read DQS Gating Calibration..... | 3851 |
| 44.11.3.1 | Hardware DQS Gating Calibration..... | 3851 |
| 44.11.3.1.1 | Hardware DQS Calibration with MPR..... | 3851 |
| 44.11.3.1.2 | Hardware DQS Calibration with pre-defined value..... | 3852 |

| Section number | Title | Page |
|----------------|---|------|
| 44.11.3.2 | SW read DQS gating Calibration..... | 3854 |
| 44.11.3.2.1 | SW read Calibration with MPR..... | 3854 |
| 44.11.3.2.2 | SW read Calibration with pre-defined value..... | 3855 |
| 44.11.4 | Read Calibration..... | 3857 |
| 44.11.4.1 | Hardware (automatic) Read Calibration..... | 3857 |
| 44.11.4.1.1 | Hardware (automatic) Calibration with MPR (DDR3) /DQ Calibration (LPDDR2)..... | 3858 |
| 44.11.4.1.2 | Hardware (automatic) Calibration with pre-defined value..... | 3858 |
| 44.11.4.2 | SW Read Calibration..... | 3860 |
| 44.11.4.2.1 | Calibration with MPR(DDR3)/DQ calibration(LPDDR2)..... | 3860 |
| 44.11.4.2.2 | Calibration with pre-defined value..... | 3860 |
| 44.11.5 | Write Calibration..... | 3862 |
| 44.11.5.1 | HW (automatic) Write Calibration..... | 3862 |
| 44.11.5.2 | SW Write Calibration..... | 3864 |
| 44.11.6 | Write leveling Calibration..... | 3865 |
| 44.11.6.1 | Hardware Write Leveling Calibration..... | 3866 |
| 44.11.6.2 | SW Write Leveling Calibration..... | 3867 |
| 44.11.7 | Write fine tuning..... | 3869 |
| 44.11.8 | Read fine tuning..... | 3869 |
| 44.12 | MMDC Memory Map/Register Definition..... | 3869 |
| 44.12.1 | MMDC Core Control Register (MMDCx_MDCTL)..... | 3880 |
| 44.12.2 | MMDC Core Power Down Control Register (MMDCx_MDPDC)..... | 3882 |
| 44.12.3 | MMDC Core ODT Timing Control Register (MMDCx_MDOTC)..... | 3885 |
| 44.12.4 | MMDC Core Timing Configuration Register 0 (MMDCx_MDCFG0)..... | 3886 |
| 44.12.5 | MMDC Core Timing Configuration Register 1 (MMDCx_MDCFG1)..... | 3888 |
| 44.12.6 | MMDC Core Timing Configuration Register 2 (MMDCx_MDCFG2)..... | 3891 |
| 44.12.7 | MMDC Core Miscellaneous Register (MMDCx_MDMISC)..... | 3892 |
| 44.12.8 | MMDC Core Special Command Register (MMDCx_MDSCR)..... | 3895 |
| 44.12.9 | MMDC Core Refresh Control Register (MMDCx_MDREF)..... | 3899 |

| Section number | Title | Page |
|----------------|---|------|
| 44.12.10 | MMDC Core Read/Write Command Delay Register (MMDCx_MDRWD)..... | 3901 |
| 44.12.11 | MMDC Core Out of Reset Delays Register (MMDCx_MDOR)..... | 3903 |
| 44.12.12 | MMDC Core MRR Data Register (MMDCx_MDMRR)..... | 3905 |
| 44.12.13 | MMDC Core Timing Configuration Register 3 (MMDCx_MDCFG3LP)..... | 3905 |
| 44.12.14 | MMDC Core MR4 Derating Register (MMDCx_MDMR4)..... | 3907 |
| 44.12.15 | MMDC Core Address Space Partition Register (MMDCx_MDASP)..... | 3909 |
| 44.12.16 | MMDC Core AXI Reordering Control Register (MMDCx_MAARCR)..... | 3910 |
| 44.12.17 | MMDC Core Power Saving Control and Status Register (MMDCx_MAPSR)..... | 3912 |
| 44.12.18 | MMDC Core Exclusive ID Monitor Register0 (MMDCx_MAEXIDR0)..... | 3914 |
| 44.12.19 | MMDC Core Exclusive ID Monitor Register1 (MMDCx_MAEXIDR1)..... | 3915 |
| 44.12.20 | MMDC Core Debug and Profiling Control Register 0 (MMDCx_MADPCR0)..... | 3915 |
| 44.12.21 | MMDC Core Debug and Profiling Control Register 1 (MMDCx_MADPCR1)..... | 3917 |
| 44.12.22 | MMDC Core Debug and Profiling Status Register 0 (MMDCx_MADPSR0)..... | 3918 |
| 44.12.23 | MMDC Core Debug and Profiling Status Register 1 (MMDCx_MADPSR1)..... | 3918 |
| 44.12.24 | MMDC Core Debug and Profiling Status Register 2 (MMDCx_MADPSR2)..... | 3919 |
| 44.12.25 | MMDC Core Debug and Profiling Status Register 3 (MMDCx_MADPSR3)..... | 3919 |
| 44.12.26 | MMDC Core Debug and Profiling Status Register 4 (MMDCx_MADPSR4)..... | 3920 |
| 44.12.27 | MMDC Core Debug and Profiling Status Register 5 (MMDCx_MADPSR5)..... | 3920 |
| 44.12.28 | MMDC Core Step By Step Address Register (MMDCx_MASBS0)..... | 3921 |
| 44.12.29 | MMDC Core Step By Step Address Attributes Register (MMDCx_MASBS1)..... | 3921 |
| 44.12.30 | MMDC Core General Purpose Register (MMDCx_MAGENP)..... | 3923 |
| 44.12.31 | MMDC PHY ZQ HW control register (MMDCx_MPZQHWCTRL)..... | 3923 |
| 44.12.32 | MMDC PHY ZQ SW control register (MMDCx_MPZQSWCTRL)..... | 3926 |
| 44.12.33 | MMDC PHY Write Leveling Configuration and Error Status Register (MMDCx_MPWLGCER)..... | 3928 |
| 44.12.34 | MMDC PHY Write Leveling Delay Control Register 0 (MMDCx_MPWLDECTRL0)..... | 3931 |
| 44.12.35 | MMDC PHY Write Leveling Delay Control Register 1 (MMDCx_MPWLDECTRL1)..... | 3933 |
| 44.12.36 | MMDC PHY Write Leveling delay-line Status Register (MMDCx_MPWLDLST)..... | 3935 |
| 44.12.37 | MMDC PHY ODT control register (MMDCx_MPODTCTRL)..... | 3937 |
| 44.12.38 | MMDC PHY Read DQ Byte0 Delay Register (MMDCx_MPRDDQBY0DL)..... | 3939 |

| Section number | Title | Page |
|----------------|--|------|
| 44.12.39 | MMDC PHY Read DQ Byte1 Delay Register (MMDCx_MPRDDQBY1DL)..... | 3942 |
| 44.12.40 | MMDC PHY Read DQ Byte2 Delay Register (MMDCx_MPRDDQBY2DL)..... | 3945 |
| 44.12.41 | MMDC PHY Read DQ Byte3 Delay Register (MMDCx_MPRDDQBY3DL)..... | 3948 |
| 44.12.42 | MMDC PHY Write DQ Byte0 Delay Register (MMDCx_MPWRDQBY0DL)..... | 3950 |
| 44.12.43 | MMDC PHY Write DQ Byte1 Delay Register (MMDCx_MPWRDQBY1DL)..... | 3952 |
| 44.12.44 | MMDC PHY Write DQ Byte2 Delay Register (MMDCx_MPWRDQBY2DL)..... | 3955 |
| 44.12.45 | MMDC PHY Write DQ Byte3 Delay Register (MMDCx_MPWRDQBY3DL)..... | 3957 |
| 44.12.46 | MMDC PHY Read DQS Gating Control Register 0 (MMDCx_MPDGCTRL0)..... | 3959 |
| 44.12.47 | MMDC PHY Read DQS Gating Control Register 1 (MMDCx_MPDGCTRL1)..... | 3962 |
| 44.12.48 | MMDC PHY Read DQS Gating delay-line Status Register (MMDCx_MPDGDLST0)..... | 3963 |
| 44.12.49 | MMDC PHY Read delay-lines Configuration Register (MMDCx_MPRDDLCTL)..... | 3965 |
| 44.12.50 | MMDC PHY Read delay-lines Status Register (MMDCx_MPRDDLST)..... | 3966 |
| 44.12.51 | MMDC PHY Write delay-lines Configuration Register (MMDCx_MPWRDLCTL)..... | 3967 |
| 44.12.52 | MMDC PHY Write delay-lines Status Register (MMDCx_MPWRDLST)..... | 3969 |
| 44.12.53 | MMDC PHY CK Control Register (MMDCx_MPSDCTRL)..... | 3970 |
| 44.12.54 | MMDC ZQ LPDDR2 HW Control Register (MMDCx_MPZQLP2CTL)..... | 3971 |
| 44.12.55 | MMDC PHY Read Delay HW Calibration Control Register (MMDCx_MPRDDLHWCTL)..... | 3972 |
| 44.12.56 | MMDC PHY Write Delay HW Calibration Control Register (MMDCx_MPWRDLHWCTL)..... | 3974 |
| 44.12.57 | MMDC PHY Read Delay HW Calibration Status Register 0 (MMDCx_MPRDDLHWST0)..... | 3976 |
| 44.12.58 | MMDC PHY Read Delay HW Calibration Status Register 1 (MMDCx_MPRDDLHWST1)..... | 3977 |
| 44.12.59 | MMDC PHY Write Delay HW Calibration Status Register 0 (MMDCx_MPWRDLHWST0)..... | 3978 |
| 44.12.60 | MMDC PHY Write Delay HW Calibration Status Register 1 (MMDCx_MPWRDLHWST1)..... | 3979 |
| 44.12.61 | MMDC PHY Write Leveling HW Error Register (MMDCx_MPWLHWERR)..... | 3980 |
| 44.12.62 | MMDC PHY Read DQS Gating HW Status Register 0 (MMDCx_MPDGHWST0)..... | 3981 |
| 44.12.63 | MMDC PHY Read DQS Gating HW Status Register 1 (MMDCx_MPDGHWST1)..... | 3981 |
| 44.12.64 | MMDC PHY Read DQS Gating HW Status Register 2 (MMDCx_MPDGHWST2)..... | 3982 |
| 44.12.65 | MMDC PHY Read DQS Gating HW Status Register 3 (MMDCx_MPDGHWST3)..... | 3983 |
| 44.12.66 | MMDC PHY Pre-defined Compare Register 1 (MMDCx_MPPDCMPR1)..... | 3983 |

| Section number | Title | Page |
|----------------|--|------|
| 44.12.67 | MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDCx_MPPDCMPR2)..... | 3984 |
| 44.12.68 | MMDC PHY SW Dummy Access Register (MMDCx_MPSWDAR0)..... | 3986 |
| 44.12.69 | MMDC PHY SW Dummy Read Data Register 0 (MMDCx_MPSWDRDR0)..... | 3988 |
| 44.12.70 | MMDC PHY SW Dummy Read Data Register 1 (MMDCx_MPSWDRDR1)..... | 3988 |
| 44.12.71 | MMDC PHY SW Dummy Read Data Register 2 (MMDCx_MPSWDRDR2)..... | 3989 |
| 44.12.72 | MMDC PHY SW Dummy Read Data Register 3 (MMDCx_MPSWDRDR3)..... | 3989 |
| 44.12.73 | MMDC PHY SW Dummy Read Data Register 4 (MMDCx_MPSWDRDR4)..... | 3990 |
| 44.12.74 | MMDC PHY SW Dummy Read Data Register 5 (MMDCx_MPSWDRDR5)..... | 3990 |
| 44.12.75 | MMDC PHY SW Dummy Read Data Register 6 (MMDCx_MPSWDRDR6)..... | 3991 |
| 44.12.76 | MMDC PHY SW Dummy Read Data Register 7 (MMDCx_MPSWDRDR7)..... | 3991 |
| 44.12.77 | MMDC PHY Measure Unit Register (MMDCx_MPMUR0)..... | 3992 |
| 44.12.78 | MMDC Write CA delay-line controller (MMDCx_MPWRCADL)..... | 3993 |
| 44.12.79 | MMDC Duty Cycle Control Register (MMDCx_MPDCCR)..... | 3995 |

Chapter 45

Network Interconnect Bus System (NIC-301)

| | | |
|----------|---|------|
| 45.1 | Overview | 3999 |
| 45.2 | Block diagram..... | 3999 |
| 45.2.1 | NIC-301 Main Features..... | 4000 |
| 45.2.2 | Modes and Operations..... | 4001 |
| 45.3 | External Signals..... | 4001 |
| 45.4 | Memory Map and Register Definition..... | 4001 |
| 45.4.1 | Memory Map..... | 4001 |
| 45.4.2 | Configuration programmers model..... | 4002 |
| 45.4.2.1 | Address control and ID registers..... | 4003 |
| 45.4.2.2 | AMBA master interface block (AMIB) configuration registers..... | 4003 |
| 45.4.2.3 | ASIB (AMBA slave interface block) configuration registers..... | 4003 |
| 45.4.3 | Register Descriptions..... | 4003 |
| 45.4.3.1 | QoS registers' address look-up example..... | 4004 |

| Section number | Title | Page |
|----------------|------------------------------|------|
| 45.4.4 | NIC-specific parameters..... | 4005 |

Chapter 46

On-Chip OTP Controller (OCOTP_CTRL)

| | | |
|----------|--|------|
| 46.1 | Overview..... | 4007 |
| 46.1.1 | Features..... | 4007 |
| 46.2 | Clocks..... | 4007 |
| 46.3 | Top-Level Symbol and Functional Overview..... | 4008 |
| 46.3.1 | Operation..... | 4008 |
| 46.3.1.1 | Shadow Register Reload..... | 4009 |
| 46.3.1.2 | Fuse and Shadow register read..... | 4009 |
| 46.3.1.3 | Fuse and Shadow Register Writes..... | 4010 |
| 46.3.1.4 | Write Postamble..... | 4011 |
| 46.3.2 | Fuse Shadow Memory Footprint..... | 4012 |
| 46.3.3 | OTP Read/Write Timing Parameters..... | 4014 |
| 46.3.4 | Hardware Visible Fuses..... | 4015 |
| 46.3.5 | Behavior During Reset..... | 4015 |
| 46.3.6 | Secure JTAG control..... | 4015 |
| 46.4 | Fuse Map..... | 4016 |
| 46.5 | OCOTP Memory Map/Register Definition..... | 4016 |
| 46.5.1 | OTP Controller Control Register (OCOTP_CTRLn)..... | 4018 |
| 46.5.2 | OTP Controller Timing Register (OCOTP_TIMING)..... | 4020 |
| 46.5.3 | OTP Controller Write Data Register (OCOTP_DATA)..... | 4021 |
| 46.5.4 | OTP Controller Write Data Register (OCOTP_READ_CTRL)..... | 4021 |
| 46.5.5 | OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA)..... | 4022 |
| 46.5.6 | Sticky bit Register (OCOTP_SW_STICKY)..... | 4023 |
| 46.5.7 | Software Controllable Signals Register (OCOTP_SCSn)..... | 4024 |
| 46.5.8 | OTP Controller Version Register (OCOTP_VERSION)..... | 4025 |
| 46.5.9 | Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK)..... | 4025 |
| 46.5.10 | Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0)..... | 4028 |

| Section number | Title | Page |
|----------------|---|------|
| 46.5.11 | Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1)..... | 4029 |
| 46.5.12 | Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (OCOTP_CFG2)..... | 4029 |
| 46.5.13 | Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3)..... | 4030 |
| 46.5.14 | Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4)..... | 4030 |
| 46.5.15 | Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5)..... | 4031 |
| 46.5.16 | Value of OTP Bank0 Word7 (Configuration and Manufacturing Info.) (OCOTP_CFG6)..... | 4031 |
| 46.5.17 | Value of OTP Bank1 Word0 (Memory Related Info.) (OCOTP_MEM0)..... | 4032 |
| 46.5.18 | Value of OTP Bank1 Word1 (Memory Related Info.) (OCOTP_MEM1)..... | 4032 |
| 46.5.19 | Value of OTP Bank1 Word2 (Memory Related Info.) (OCOTP_MEM2)..... | 4033 |
| 46.5.20 | Value of OTP Bank1 Word3 (Memory Related Info.) (OCOTP_MEM3)..... | 4033 |
| 46.5.21 | Value of OTP Bank1 Word4 (Memory Related Info.) (OCOTP_MEM4)..... | 4034 |
| 46.5.22 | Value of OTP Bank1 Word5 (Memory Related Info.) (OCOTP_ANA0)..... | 4034 |
| 46.5.23 | Value of OTP Bank1 Word6 (General Purpose Customer Defined Info.) (OCOTP_ANA1)..... | 4035 |
| 46.5.24 | Value of OTP Bank1 Word7 (General Purpose Customer Defined Info.) (OCOTP_ANA2)..... | 4035 |
| 46.5.25 | Shadow Register for OTP Bank3 Word0 (SRK Hash) (OCOTP_SRK0)..... | 4036 |
| 46.5.26 | Shadow Register for OTP Bank3 Word1 (SRK Hash) (OCOTP_SRK1)..... | 4036 |
| 46.5.27 | Shadow Register for OTP Bank3 Word2 (SRK Hash) (OCOTP_SRK2)..... | 4037 |
| 46.5.28 | Shadow Register for OTP Bank3 Word3 (SRK Hash) (OCOTP_SRK3)..... | 4037 |
| 46.5.29 | Shadow Register for OTP Bank3 Word4 (SRK Hash) (OCOTP_SRK4)..... | 4038 |
| 46.5.30 | Shadow Register for OTP Bank3 Word5 (SRK Hash) (OCOTP_SRK5)..... | 4038 |
| 46.5.31 | Shadow Register for OTP Bank3 Word6 (SRK Hash) (OCOTP_SRK6)..... | 4039 |
| 46.5.32 | Shadow Register for OTP Bank3 Word7 (SRK Hash) (OCOTP_SRK7)..... | 4039 |
| 46.5.33 | Value of OTP Bank4 Word0 (Secure JTAG Response Field) (OCOTP_RESP0)..... | 4040 |
| 46.5.34 | Value of OTP Bank4 Word1 (Secure JTAG Response Field) (OCOTP_HSJC_RESP1)..... | 4040 |
| 46.5.35 | Value of OTP Bank4 Word2 (MAC Address) (OCOTP_MAC0)..... | 4041 |
| 46.5.36 | Value of OTP Bank4 Word3 (MAC Address) (OCOTP_MAC1)..... | 4041 |
| 46.5.37 | Value of OTP Bank4 Word6 (HW Capabilities) (OCOTP_GP1)..... | 4042 |
| 46.5.38 | Value of OTP Bank4 Word7 (HW Capabilities) (OCOTP_GP2)..... | 4042 |
| 46.5.39 | Value of OTP Bank5 Word5 (HW Capabilities) (OCOTP_MISC_CONF)..... | 4043 |

| Section number | Title | Page |
|----------------|--|------|
| 46.5.40 | Value of OTP Bank5 Word6 (HW Capabilities) (OCOTP_FIELD_RETURN)..... | 4043 |
| 46.5.41 | Value of OTP Bank5 Word7 (HW Capabilities) (OCOTP_SRK_REVOKE)..... | 4044 |

Chapter 47 On-Chip RAM Memory Controller (OCRAM)

| | | |
|--------|-----------------------------|------|
| 47.1 | Overview..... | 4045 |
| 47.2 | Basic Functions..... | 4046 |
| 47.2.1 | Memory Map..... | 4046 |
| 47.2.2 | Read/Write Arbitration..... | 4047 |
| 47.2.3 | TrustZone..... | 4047 |
| 47.3 | Advanced Features..... | 4047 |
| 47.3.1 | Read Data Wait State..... | 4048 |
| 47.3.2 | Read Address Pipeline..... | 4048 |
| 47.3.3 | Write Data Pipeline..... | 4048 |
| 47.3.4 | Write Address Pipeline..... | 4049 |
| 47.4 | Programmable Registers..... | 4049 |

Chapter 48 PCI Express (PCIe)

| | | |
|------------|--|------|
| 48.1 | Overview..... | 4051 |
| 48.1.1 | Terms and Abbreviations..... | 4051 |
| 48.2 | Architecture..... | 4053 |
| 48.2.1 | Common Xpress Port Logic (CXPL)..... | 4055 |
| 48.2.2 | Transmit Application-Dependent Module (XADM)..... | 4056 |
| 48.2.2.1 | Arbitration..... | 4057 |
| 48.2.2.2 | Credit Checking..... | 4058 |
| 48.2.3 | Receive Application-Dependent Module (RADM)..... | 4058 |
| 48.2.3.1 | Posted and Non-Posted Request and Completion TLP Processing..... | 4059 |
| 48.2.3.1.1 | TLP Routing..... | 4060 |
| 48.2.3.2 | Received Completion TLP Processing..... | 4060 |
| 48.2.3.3 | Message Processing..... | 4061 |

| Section number | Title | Page |
|----------------|--|------|
| 48.2.4 | Configuration-Dependent Module (CDM)..... | 4061 |
| 48.2.5 | Local Bus Controller (LBC) and Data bus Interface (DBI)..... | 4062 |
| 48.2.5.1 | Overview (LBC)..... | 4062 |
| 48.2.5.1.1 | Simultaneous Transactions..... | 4064 |
| 48.2.5.2 | ELBI..... | 4064 |
| 48.2.5.3 | CDM Register Space Layout..... | 4064 |
| 48.2.5.3.1 | PCI Configuration Header and Capability Registers (in CDM)..... | 4066 |
| 48.2.5.3.2 | Port Logic (PL) Registers (in CDM)..... | 4066 |
| 48.2.5.3.3 | Memory Mapping PL Registers..... | 4066 |
| 48.2.5.4 | PCIe Wire Access (EP mode)..... | 4067 |
| 48.2.5.5 | PCIe Wire Access (RC mode)..... | 4068 |
| 48.3 | Core Operations..... | 4069 |
| 48.3.1 | Initialization..... | 4069 |
| 48.3.2 | Link Establishment..... | 4071 |
| 48.3.3 | Transmit TLP Processing..... | 4072 |
| 48.3.3.1 | Transmit Overview..... | 4073 |
| 48.3.3.2 | Transmit TLP Arbitration..... | 4073 |
| 48.3.3.2.1 | Client-Based Arbitration..... | 4074 |
| 48.3.3.3 | Transmit Retry..... | 4074 |
| 48.3.3.4 | Transmit DLLP Priorities..... | 4075 |
| 48.3.4 | Receive TLP Processing..... | 4075 |
| 48.3.4.1 | Receive Overview..... | 4075 |
| 48.3.4.2 | Receive Filtering..... | 4076 |
| 48.3.4.2.1 | Filtering Rules Applicable for all TLPs Received..... | 4077 |
| 48.3.4.2.2 | Filtering Rules Based on TLP Type Defined in PCIe Specification..... | 4078 |
| 48.3.4.2.2.1 | EP MODE FILTERING RULES..... | 4079 |
| 48.3.4.2.2.2 | RC MODE FILTERING RULES..... | 4080 |
| 48.3.4.2.3 | Filtering Rules Not Defined in PCIe Specification..... | 4082 |

| Section number | Title | Page |
|----------------|--|------|
| 48.3.4.3 | Receive Routing..... | 4082 |
| 48.3.4.3.1 | EP Mode..... | 4082 |
| 48.3.4.3.2 | RC mode..... | 4084 |
| 48.3.4.3.3 | ECRC Handling..... | 4085 |
| 48.3.4.3.4 | Request TLP Routing Rules..... | 4085 |
| 48.3.4.3.5 | Completion TLP Routing Rules..... | 4087 |
| 48.3.4.4 | Receive Queuing..... | 4088 |
| 48.3.4.4.1 | Queuing Architecture..... | 4089 |
| 48.3.4.4.1.1 | SEGMENTED-BUFFER RECEIVE QUEUE CONFIGURATION (CX_RADMQ_MODE=2)..... | 4089 |
| 48.3.4.4.2 | Queue Modes..... | 4090 |
| 48.3.4.4.3 | Order Enforcement..... | 4091 |
| 48.3.4.4.4 | Queue to Port Mapping..... | 4091 |
| 48.3.5 | Error Handling..... | 4092 |
| 48.3.5.1 | Error Handling Overview..... | 4092 |
| 48.3.5.2 | PCIe Baseline Capability..... | 4093 |
| 48.3.5.3 | Advanced Error Reporting (AER)..... | 4094 |
| 48.3.5.3.1 | Advisory Non-Fatal Error Messages..... | 4094 |
| 48.3.5.4 | Error Source Classification..... | 4095 |
| 48.3.5.5 | Error Detection..... | 4096 |
| 48.3.5.6 | Application Error Reporting Interface..... | 4098 |
| 48.3.5.7 | Handling of General Errors with the AXI Bridge..... | 4099 |
| 48.3.5.8 | AXI..... | 4099 |
| 48.3.5.9 | Handling of ECRC/LCRC Errors for IO/MEM with the AXI Bridge..... | 4099 |
| 48.3.5.9.1 | Link CRC (LCRC) - a correctable Error..... | 4099 |
| 48.3.5.9.2 | End-to-end CRC (ECRC) - an Uncorrectable Non-Fatal Error..... | 4100 |

| Section number | Title | Page |
|----------------|--|------|
| 48.3.6 | Messages..... | 4100 |
| 48.3.6.1 | Message Generation..... | 4101 |
| 48.3.6.1.1 | Vendor Defined Message (VDM) Generation..... | 4104 |
| 48.3.6.1.1.1 | Application Msg/MsgD Programming Examples..... | 4104 |
| 48.3.6.1.2 | AHB/AXI Message Address and Size Limitations..... | 4105 |
| 48.3.6.2 | Message Reception..... | 4106 |
| 48.3.6.2.1 | Message Reception IO Interfaces..... | 4108 |
| 48.3.6.2.2 | Routing of Received Messages to SII and optionally to Application..... | 4109 |
| 48.3.6.2.3 | Accessing Header and Payload Fields of Received Messages..... | 4110 |
| 48.3.7 | Interrupts..... | 4111 |
| 48.3.7.1 | Interrupts Overview..... | 4111 |
| 48.3.7.1.1 | PCI Legacy Interrupt..... | 4112 |
| 48.3.7.1.2 | MSI..... | 4113 |
| 48.3.7.1.3 | MSI-X..... | 4115 |
| 48.3.7.2 | Interrupts (EP Mode)..... | 4117 |
| 48.3.7.3 | Interrupts (RC Mode)..... | 4118 |
| 48.3.7.4 | MSI Generation in the AXI Bridge..... | 4119 |
| 48.3.7.5 | MSI Reception in the AHB/AXI Bridge..... | 4119 |
| 48.3.7.5.1 | AHB/AXI MSI Controller (Optional in RC mode)..... | 4119 |
| 48.3.7.5.2 | Programming and Usage Model..... | 4121 |
| 48.3.8 | Flow Control..... | 4124 |
| 48.3.9 | Address Translation..... | 4125 |
| 48.3.9.1 | Internal Address Translation (iATU)..... | 4127 |
| 48.3.9.1.1 | Outbound (TX) Features..... | 4127 |
| 48.3.9.1.2 | Inbound (RX) Features..... | 4128 |
| 48.3.9.1.3 | Programming (iATU)..... | 4128 |
| 48.3.9.2 | Outbound iATU Operation..... | 4129 |
| 48.3.9.2.1 | Inbound iATU Operation..... | 4134 |
| 48.3.9.3 | Overview (iATU)..... | 4135 |

| Section number | Title | Page |
|----------------|---|------|
| 48.3.10 | Gen2 5.0 GT/s Operation..... | 4141 |
| 48.3.10.1 | Overview (Gen2 5.0 GT/s)..... | 4141 |
| 48.3.10.2 | Speed Changing..... | 4141 |
| 48.3.11 | Power Management..... | 4142 |
| 48.3.11.1 | L0s Power Down..... | 4144 |
| 48.3.11.2 | L1 Power Down..... | 4145 |
| 48.3.12 | Completion Timeout Ranges..... | 4147 |
| 48.4 | AXI Bridge Module..... | 4147 |
| 48.4.1 | Product Overview..... | 4148 |
| 48.4.1.1 | Overview..... | 4148 |
| 48.4.1.2 | Interfaces..... | 4149 |
| 48.4.1.3 | Features List..... | 4150 |
| 48.4.1.4 | Limitations..... | 4151 |
| 48.4.2 | Bridge Architecture..... | 4152 |
| 48.4.2.1 | Bridge Architecture Overview..... | 4152 |
| 48.4.2.1.1 | Inbound Processing Module Chain..... | 4153 |
| 48.4.2.1.2 | Outbound Processing Module Chain..... | 4154 |
| 48.4.2.2 | Decomposition..... | 4155 |
| 48.4.2.3 | Bridge Buffering..... | 4156 |
| 48.4.2.4 | Outbound Bridge Tag Management..... | 4157 |
| 48.4.2.5 | Inbound Bridge Tag Management..... | 4159 |
| 48.4.2.6 | Inbound Order Enforcement for AXI Bridge..... | 4161 |
| 48.4.2.6.1 | Ordering Enforcement Hardware Lock Feature..... | 4162 |
| 48.4.2.6.2 | Re-Ordering Effects of AXI Fabric..... | 4163 |
| 48.4.2.6.2.1 | Inbound Ordering Limitation..... | 4164 |
| 48.4.2.6.3 | Additional Information (ordering)..... | 4164 |
| 48.4.2.6.4 | PCIe Completion Reordering..... | 4165 |
| 48.4.2.6.5 | Outbound Ordering Limitation #1..... | 4165 |
| 48.4.2.6.6 | Outbound Ordering Limitation #2..... | 4166 |

| Section number | Title | Page |
|----------------|---|------|
| | 48.4.2.6.7 Additional Information (AXI bridge bandwidth)..... | 4166 |
| 48.4.3 | PCIe AXI Core Operations..... | 4166 |
| 48.4.3.1 | AXI Sideband (Misc. Bus) Signals..... | 4166 |
| 48.4.3.2 | Supported AXI Transfer Type..... | 4167 |
| 48.4.3.3 | Supported AXI Burst Operations..... | 4167 |
| 48.4.3.4 | I/O and CFG Transaction Handling over AXI Bridge..... | 4167 |
| | 48.4.3.4.1 Outbound I/O and CFG Transaction Handling..... | 4168 |
| | 48.4.3.4.1.1 Method I: Address Translation Method of Sending an Outbound IO or CFG Transfer..... | 4168 |
| | 48.4.3.4.2 Inbound I/O and CFG Transaction Handling..... | 4168 |
| 48.4.4 | Additional AXI Reference Material..... | 4169 |
| 48.4.4.1 | AXI Decomposition Rules..... | 4169 |
| | 48.4.4.1.1 Outbound Decomposition..... | 4169 |
| | 48.4.4.1.1.1 Decomposition Side-Effects..... | 4171 |
| | 48.4.4.1.1.2 Reducing Outbound Decomposition..... | 4171 |
| | 48.4.4.1.2 Inbound Decomposition..... | 4171 |
| | 48.4.4.1.2.1 Reducing Inbound Decomposition..... | 4172 |
| 48.5 | App Note: Order Enforcement Using the PCIe Core..... | 4173 |
| 48.5.1 | PCIe Ordering Rule Overview..... | 4173 |
| 48.5.2 | PCIe Core Inbound Order Enforcement..... | 4174 |
| | 48.5.2.1 Single queue..... | 4174 |
| | 48.5.2.2 Multiple queue..... | 4175 |
| | 48.5.2.3 Segmented buffer queue..... | 4176 |
| 48.5.3 | PCIe Core Outbound Order Enforcement..... | 4177 |
| 48.5.4 | PCIe AHB/AXI Bridge Order Enforcement..... | 4179 |
| 48.5.5 | Additional Information..... | 4179 |
| 48.6 | App Note: Calculating Gen1 PCI Express and AXI Bridge Throughput..... | 4179 |
| 48.6.1 | PCI Express Throughput..... | 4180 |

| Section number | Title | Page |
|----------------|---|------|
| 48.6.2 | Effective Throughput..... | 4180 |
| 48.6.2.1 | Effective Throughput Calculation..... | 4180 |
| 48.6.2.1.1 | Packet Level: (Start and End, Link CRC, Header)..... | 4180 |
| 48.6.2.1.2 | Link Layer: (Flow Control and ACK/NAK DLLPs)..... | 4181 |
| 48.6.2.2 | Other Factors Impacting Throughput..... | 4182 |
| 48.7 | Registers..... | 4183 |
| 48.7.1 | PCIe Registers (EP mode)..... | 4183 |
| 48.7.1.1 | Register Space Layout (EP mode)..... | 4183 |
| 48.7.1.2 | PF Register Maps..... | 4184 |
| 48.7.1.2.1 | PF PCI Configuration Space Header - Type 0..... | 4185 |
| 48.7.1.2.2 | PF PCI Standard Capability Structures Register Maps..... | 4185 |
| 48.7.1.2.3 | PF PCI Express Extended Capability Register Maps..... | 4187 |
| 48.7.1.3 | VF Register Maps..... | 4189 |
| 48.7.1.3.1 | VF PCI Configuration Space Header - Type 0..... | 4189 |
| 48.7.1.3.2 | VF PCI Standard Capability Structures Register Maps..... | 4190 |
| 48.7.1.4 | Accessing Configuration Registers..... | 4191 |
| 48.7.2 | PCIe Registers (RC mode)..... | 4192 |
| 48.7.2.1 | Register Space Layout..... | 4192 |
| 48.7.2.2 | Register Maps..... | 4194 |
| 48.7.2.2.1 | PCI Standard Capability Structures Register Maps..... | 4195 |
| 48.7.2.2.2 | PCI Express Extended Capability Register Maps..... | 4197 |
| 48.7.2.3 | Accessing Configuration Registers (Configuration)..... | 4199 |
| 48.7.3 | PCIe Registers: Port Logic..... | 4200 |
| 48.7.3.1 | Overview (Port Logic)..... | 4200 |
| 48.7.3.2 | Non-Standard Addressing of the iATU Port Logic Registers..... | 4201 |
| 48.7.3.3 | Accessing Configuration Registers (Port Logic Registers)..... | 4201 |
| 48.8 | PCIe CTRL EP Mode Memory Map/Register Definition..... | 4202 |
| 48.8.1 | Device ID and Vendor ID Register (PCIE_EP_DeviceID)..... | 4204 |
| 48.8.2 | Command and Status Register (PCIE_EP_Command)..... | 4204 |

| Section number | Title | Page |
|----------------|---|------|
| 48.8.3 | BIST Register (PCIE_EP_BIST)..... | 4207 |
| 48.8.4 | Base Address 0 (PCIE_EP_BAR0)..... | 4208 |
| 48.8.5 | BAR 0 Mask Register (PCIE_EP_MASK0)..... | 4210 |
| 48.8.6 | BAR 1 Mask Register (PCIE_EP_MASK1)..... | 4213 |
| 48.8.7 | BAR 2 Mask Register (PCIE_EP_MASK2)..... | 4214 |
| 48.8.8 | BAR 3 Mask Register (PCIE_EP_MASK3)..... | 4215 |
| 48.8.9 | CardBus CIS Pointer Register (PCIE_EP_CISP)..... | 4216 |
| 48.8.10 | Subsystem ID and Subsystem Vendor ID Register (PCIE_EP_SSID)..... | 4216 |
| 48.8.11 | Expansion ROM Base Address Register (PCIE_EP_EROMBAR)..... | 4217 |
| 48.8.12 | Expansion ROM BAR Mask Register (PCIE_EP_EROMMASK)..... | 4218 |
| 48.8.13 | Capability Pointer Register (PCIE_EP_CAPPR)..... | 4219 |
| 48.8.14 | Interrupt Line and Pin Register (PCIE_EP_ILR)..... | 4219 |
| 48.8.15 | AER Capability Header (PCIE_EP_AER)..... | 4220 |
| 48.8.16 | Uncorrectable Error Status Register (PCIE_EP_UESR)..... | 4221 |
| 48.8.17 | Uncorrectable Error Mask Register (PCIE_EP_UEMR)..... | 4223 |
| 48.8.18 | Uncorrectable Error Severity Register (PCIE_EP_UESevR)..... | 4225 |
| 48.8.19 | Correctable Error Status Register (PCIE_EP_CESR)..... | 4227 |
| 48.8.20 | Correctable Error Mask Register (PCIE_EP_CEMR)..... | 4228 |
| 48.8.21 | Advanced Capabilities and Control Register (PCIE_EP_ACCR)..... | 4230 |
| 48.8.22 | Header Log Register (PCIE_EP_HLR)..... | 4231 |
| 48.8.23 | VC Extended Capability Header (PCIE_EP_VCECHR)..... | 4231 |
| 48.8.24 | Port VC Capability Register 1 (PCIE_EP_PVCCR1)..... | 4233 |
| 48.8.25 | Port VC Capability Register 2 (PCIE_EP_PVCCR2)..... | 4234 |
| 48.8.26 | Port VC Control and Status Register (PCIE_EP_PVCCSR)..... | 4235 |
| 48.8.27 | VC Resource Capability Register n (PCIE_EP_VCRCR)..... | 4237 |
| 48.8.28 | VC Resource Control Register n (PCIE_EP_VCRConR)..... | 4239 |
| 48.8.29 | VC Resource Status Register n (PCIE_EP_VCRSR)..... | 4241 |
| 48.9 | PCIe CTRL RC Mode Memory Map/Register Definition..... | 4242 |
| 48.9.1 | Device ID and Vendor ID Register (PCIE_RC_DeviceID)..... | 4245 |

| Section number | Title | Page |
|----------------|--|------|
| 48.9.2 | Command and Status Register (PCIE_RC_Command)..... | 4245 |
| 48.9.3 | Revision ID and Class Code Register (PCIE_RC_RevID)..... | 4248 |
| 48.9.4 | BIST Register (PCIE_RC_BIST)..... | 4248 |
| 48.9.5 | Base Address 0 (PCIE_RC_BAR0)..... | 4249 |
| 48.9.6 | Base Address 1 (PCIE_RC_BAR1)..... | 4252 |
| 48.9.7 | Bus Number Registers (PCIE_RC_BNR)..... | 4252 |
| 48.9.8 | I/O Base Limit Secondary Status Register (PCIE_RC_IOBLSSR)..... | 4254 |
| 48.9.9 | Memory Base and Memory Limit Register (PCIE_RC_MEM_BLR)..... | 4256 |
| 48.9.10 | Prefetchable Memory Base and Limit Register (PCIE_RC_PREF_MEM_BLR)..... | 4257 |
| 48.9.11 | Prefetchable Base Upper 32 Bits Register (PCIE_RC_PREF_BASE_U32)..... | 4257 |
| 48.9.12 | Prefetchable Limit Upper 32 Bits Register (PCIE_RC_PREF_LIM_U32)..... | 4258 |
| 48.9.13 | I/O Base and Limit Upper 16 Bits Register (PCIE_RC_IO_BASE_LIM_U16)..... | 4258 |
| 48.9.14 | Capability Pointer Register (PCIE_RC_CAPPR)..... | 4259 |
| 48.9.15 | Expansion ROM Base Address Register (PCIE_RC_EROMBAR)..... | 4259 |
| 48.9.16 | Expansion ROM BAR Mask Register (PCIE_RC_EROMMASK)..... | 4260 |
| 48.9.17 | Power Management Capability Register (PCIE_RC_PMCR)..... | 4261 |
| 48.9.18 | Power Management Control and Status Register (PCIE_RC_PMCSR)..... | 4264 |
| 48.9.19 | PCI Express Capability ID Register (PCIE_RC_CIDR)..... | 4265 |
| 48.9.20 | Device Capabilities Register (PCIE_RC_DCR)..... | 4268 |
| 48.9.21 | Device Control Register (PCIE_RC_DConR)..... | 4270 |
| 48.9.22 | Link Capabilities Register (PCIE_RC_LCR)..... | 4272 |
| 48.9.23 | Link Control and Status Register (PCIE_RC_LCSR)..... | 4275 |
| 48.9.24 | Slot Capabilities Register (PCIE_RC_SCR)..... | 4277 |
| 48.9.25 | Slot Control and Status Register (PCIE_RC_SCSR)..... | 4280 |
| 48.9.26 | Root Control and Capabilities Register (PCIE_RC_RCCR)..... | 4283 |
| 48.9.27 | Root Status Register (PCIE_RC_RSR)..... | 4285 |
| 48.9.28 | Device Capabilities 2 Register (PCIE_RC_DCR2)..... | 4286 |
| 48.9.29 | Device Control and Status 2 Register (PCIE_RC_DCSR2)..... | 4288 |
| 48.9.30 | Link Capabilities 2 Register (PCIE_RC_LCR2)..... | 4290 |

| Section number | Title | Page |
|----------------|--|------|
| 48.9.31 | Link Control and Status 2 Register (PCIE_RC_LCSR2)..... | 4292 |
| 48.9.32 | AER Capability Header (PCIE_RC_AER)..... | 4294 |
| 48.9.33 | Uncorrectable Error Status Register (PCIE_RC_UESR)..... | 4295 |
| 48.9.34 | Uncorrectable Error Mask Register (PCIE_RC_UEMR)..... | 4297 |
| 48.9.35 | Uncorrectable Error Severity Register (PCIE_RC_UESevR)..... | 4299 |
| 48.9.36 | Correctable Error Status Register (PCIE_RC_CESR)..... | 4301 |
| 48.9.37 | Correctable Error Mask Register (PCIE_RC_CEMR)..... | 4302 |
| 48.9.38 | Advanced Capabilities and Control Register (PCIE_RC_ACCR)..... | 4304 |
| 48.9.39 | Header Log Register (PCIE_RC_HLR)..... | 4305 |
| 48.9.40 | Root Error Command Register (PCIE_RC_RECR)..... | 4306 |
| 48.9.41 | Root Error Status Register (PCIE_RC_RESR)..... | 4307 |
| 48.9.42 | Error Source Identification Register (PCIE_RC_ESIR)..... | 4308 |
| 48.9.43 | VC Extended Capability Header (PCIE_RC_VCECHR)..... | 4309 |
| 48.9.44 | Port VC Capability Register 1 (PCIE_RC_PVCCR1)..... | 4310 |
| 48.9.45 | Port VC Capability Register 2 (PCIE_RC_PVCCR2)..... | 4311 |
| 48.9.46 | Port VC Control and Status Register (PCIE_RC_PVCCSR)..... | 4312 |
| 48.9.47 | VC Resource Capability Register n (PCIE_RC_VCRCR)..... | 4314 |
| 48.9.48 | VC Resource Control Register n (PCIE_RC_VCRConR)..... | 4316 |
| 48.9.49 | VC Resource Status Register n (PCIE_RC_VCRSR)..... | 4318 |
| 48.10 | PCIe CTRL Port Logic Memory Map/Register Definition..... | 4319 |
| 48.10.1 | Ack Latency Timer and Replay Timer Register (PCIE_PL_ALTRTR)..... | 4322 |
| 48.10.2 | Vendor Specific DLLP Register (PCIE_PL_VSDR)..... | 4323 |
| 48.10.3 | Port Force Link Register (PCIE_PL_PFLR)..... | 4323 |
| 48.10.4 | Ack Frequency and L0-L1 ASPM Control Register (PCIE_PL_AFLACR)..... | 4325 |
| 48.10.5 | Port Link Control Register (PCIE_PL_PLCR)..... | 4327 |
| 48.10.6 | Lane Skew Register (PCIE_PL_LSR)..... | 4329 |
| 48.10.7 | Symbol Number Register (PCIE_PL_SNR)..... | 4330 |
| 48.10.8 | Symbol Timer Register and Filter Mask Register 1 (PCIE_PL_STRFM1)..... | 4331 |
| 48.10.9 | Filter Mask Register 2 (PCIE_PL_STRFM2)..... | 4335 |

| Section number | Title | Page |
|----------------|--|------|
| 48.10.10 | AMBA Multiple Outbound Decomposed NP Sub-Requests Control Register (PCIE_PL_AMODNPSR)..... | 4336 |
| 48.10.11 | Debug Register 0 (PCIE_PL_DEBUG0)..... | 4337 |
| 48.10.12 | Debug Register 1 (PCIE_PL_DEBUG1)..... | 4337 |
| 48.10.13 | Transmit Posted FC Credit Status Register (PCIE_PL_TPFCSR)..... | 4339 |
| 48.10.14 | Transmit Non-Posted FC Credit Status Register (PCIE_PL_TNFCSR)..... | 4339 |
| 48.10.15 | Transmit Completion FC Credit Status Register (PCIE_PL_TCFCSR)..... | 4340 |

Chapter 50 Power Management Unit (PMU)

| | | |
|----------|---|------|
| 50.1 | Overview..... | 4439 |
| 50.2 | Digital LDO Regulators..... | 4441 |
| 50.3 | Analog LDO Regulators..... | 4442 |
| 50.3.1 | LDO 1P1..... | 4442 |
| 50.3.2 | LDO 2P5..... | 4443 |
| 50.3.2.1 | Low Power Operation..... | 4443 |
| 50.4 | USB LDO Regulator..... | 4444 |
| 50.5 | SNVS Regulator..... | 4444 |
| 50.6 | Power Modes..... | 4444 |
| 50.6.1 | Reverse Well Biasing..... | 4445 |
| 50.7 | PMU Memory Map/Register Definition..... | 4445 |
| 50.7.1 | Digital Regulator Core Register (PMU_REG_CORE)..... | 4446 |
| 50.7.2 | Miscellaneous Register 0 (PMU_MISC0)..... | 4449 |
| 50.7.3 | Miscellaneous Register 1 (PMU_MISC1n)..... | 4452 |
| 50.7.4 | Miscellaneous Control Register (PMU_MISC2n)..... | 4455 |

Chapter 51 Pulse Width Modulation (PWM)

| | | |
|------|---------------|------|
| 51.1 | Overview..... | 4459 |
|------|---------------|------|

| Section number | Title | Page |
|----------------|--|------|
| 51.2 | External Signals..... | 4460 |
| 51.3 | Clocks..... | 4461 |
| 51.4 | Functional Description..... | 4462 |
| 51.4.1 | Operation..... | 4463 |
| 51.4.1.1 | FIFO..... | 4463 |
| 51.4.1.2 | Rollover and Compare Event..... | 4464 |
| 51.4.1.3 | Low Power Mode Behavior..... | 4464 |
| 51.4.1.4 | Debug Mode Behavior..... | 4464 |
| 51.5 | Enable Sequence for the PWM..... | 4464 |
| 51.6 | Disable Sequence for the PWM..... | 4465 |
| 51.7 | PWM Memory Map/Register Definition..... | 4465 |
| 51.7.1 | PWM Control Register (PWMx_PWMCR)..... | 4467 |
| 51.7.2 | PWM Status Register (PWMx_PWMSR)..... | 4469 |
| 51.7.3 | PWM Interrupt Register (PWMx_PWMIR)..... | 4470 |
| 51.7.4 | PWM Sample Register (PWMx_PWMSAR)..... | 4471 |
| 51.7.5 | PWM Period Register (PWMx_PWMPR)..... | 4472 |
| 51.7.6 | PWM Counter Register (PWMx_PWMCNR)..... | 4473 |

Chapter 52 ROM Controller with Patch (ROMC)

| | | |
|----------|---|------|
| 52.1 | Overview..... | 4475 |
| 52.1.1 | Features..... | 4476 |
| 52.1.2 | Modes of Operation..... | 4476 |
| 52.1.2.1 | Low Power Mode..... | 4477 |
| 52.2 | Clocks..... | 4477 |
| 52.3 | Memory Map..... | 4477 |
| 52.3.1 | ROM Memory Map in detail..... | 4477 |
| 52.4 | Functional Description..... | 4478 |
| 52.4.1 | ROM Controller (ROMC) Functional Description..... | 4478 |
| 52.4.1.1 | Functionality overview..... | 4478 |

| Section number | Title | Page |
|----------------|---|------|
| 52.4.2 | ROMC Functional Description..... | 4478 |
| 52.4.2.1 | ROMC Disabling..... | 4479 |
| 52.4.2.2 | ROMC Event Priority..... | 4479 |
| 52.4.2.3 | Data Fixing..... | 4479 |
| 52.4.2.4 | Opcode Patching..... | 4480 |
| 52.4.2.4.1 | Typical Software Response to Opcode Patch..... | 4481 |
| 52.4.2.5 | External Boot Feature..... | 4482 |
| 52.4.2.6 | Alternate Masters and ROMC..... | 4483 |
| 52.5 | ROMCP Memory Map/Register Definition..... | 4483 |
| 52.5.1 | ROMC Data Registers (ROMC_ROMPATCHnD)..... | 4484 |
| 52.5.2 | ROMC Control Register (ROMC_ROMPATCHCNTL)..... | 4485 |
| 52.5.3 | ROMC Enable Register High (ROMC_ROMPATCHENH)..... | 4486 |
| 52.5.4 | ROMC Enable Register Low (ROMC_ROMPATCHENL)..... | 4486 |
| 52.5.5 | ROMC Address Registers (ROMC_ROMPATCHnA)..... | 4487 |
| 52.5.6 | ROMC Status Register (ROMC_ROMPATCHSR)..... | 4488 |

Chapter 53

Serial Advanced Technology Attachment Controller (SATA)

| | | |
|----------|------------------------------------|------|
| 53.1 | Introduction..... | 4491 |
| 53.1.1 | Features..... | 4491 |
| 53.1.2 | System Overview..... | 4492 |
| 53.2 | Block Overview..... | 4492 |
| 53.2.1 | Block Diagram..... | 4492 |
| 53.2.2 | SATA Block Transfer Hierarchy..... | 4494 |
| 53.2.3 | Standards Compliance..... | 4495 |
| 53.3 | Architecture..... | 4495 |
| 53.3.1 | Architecture Overview..... | 4495 |
| 53.3.2 | Bus Interface Unit..... | 4496 |
| 53.3.2.1 | AHB Slave Bus GIF Interface..... | 4497 |
| 53.3.2.2 | Register Read Multiplexer..... | 4499 |

| Section number | Title | Page |
|----------------|--|------|
| 53.3.2.3 | AHB Master Bus/GIF Interface..... | 4499 |
| 53.3.2.4 | DMA Arbiter..... | 4500 |
| 53.3.3 | Generic Registers (GCSR)..... | 4500 |
| 53.3.4 | Port..... | 4501 |
| 53.3.4.1 | Port DMA..... | 4501 |
| 53.3.4.2 | Port Registers..... | 4502 |
| 53.3.4.3 | Transport Layer..... | 4503 |
| 53.3.4.3.1 | Transport Layer FIS Reception..... | 4505 |
| 53.3.4.3.2 | Transport Layer FIS Transmission..... | 4505 |
| 53.3.4.3.3 | Error Handling..... | 4506 |
| 53.3.4.3.4 | Receive/Transmit FIFO (Rx/TxFIFO)..... | 4506 |
| 53.3.4.4 | Transport Check (TCHK)..... | 4508 |
| 53.3.4.4.1 | Transport State Machine (TSM)..... | 4509 |
| 53.3.4.4.2 | Sync Module (APP_ASIC)..... | 4510 |
| 53.3.4.5 | Link Layer..... | 4510 |
| 53.3.4.5.1 | Link Layer Features..... | 4513 |
| 53.3.4.5.2 | User-Defined Status and Control..... | 4513 |
| 53.3.4.5.3 | PHY Initialization Details..... | 4514 |
| 53.3.4.5.3.1 | Link Layer Tx OOB Initialization Sequence Details..... | 4515 |
| 53.3.4.5.3.2 | Link Layer Tx OOB Sequence Generation..... | 4518 |
| 53.3.4.5.3.3 | Link Layer Rx OOB Sequence Detection..... | 4520 |
| 53.3.4.5.4 | Link Layer Power Management Details..... | 4522 |
| 53.3.4.6 | Port Power Control Module..... | 4524 |
| 53.3.5 | Operation Details..... | 4528 |
| 53.3.5.1 | Data Transfer..... | 4528 |
| 53.3.5.1.1 | ATA DMA Read..... | 4528 |
| 53.3.5.1.2 | ATA DMA Write..... | 4529 |
| 53.3.5.1.3 | Native Queued Command (NCQ) Transfers..... | 4529 |
| 53.3.5.1.4 | PIO Transfer..... | 4530 |

| Section number | Title | Page |
|----------------|---|------|
| 53.3.5.1.5 | Transaction Size..... | 4530 |
| 53.3.5.2 | Power Management Operations..... | 4531 |
| 53.3.5.3 | Hot Plug..... | 4532 |
| 53.3.5.3.1 | Native Hot Plug..... | 4532 |
| 53.3.5.4 | Port Multiplier Support..... | 4532 |
| 53.3.5.5 | Interrupts..... | 4532 |
| 53.3.5.5.1 | First Tier (SATA_IS Register)..... | 4533 |
| 53.3.5.5.2 | Second Tier (SATA_P 0IS Registers)..... | 4533 |
| 53.3.5.5.3 | Message Signaled Interrupt..... | 4534 |
| 53.3.5.6 | PHY and Link Control..... | 4535 |
| 53.3.5.7 | Reset Conditions..... | 4535 |
| 53.3.5.7.1 | System Reset..... | 4535 |
| 53.3.5.8 | Global Reset..... | 4535 |
| 53.3.5.8.1 | Port Reset (COMRESET)..... | 4536 |
| 53.3.5.8.2 | Software Reset..... | 4536 |
| 53.3.5.9 | Interface Speed Support..... | 4537 |
| 53.3.5.10 | Staggered Spin-up..... | 4537 |
| 53.3.5.11 | Activity LED..... | 4538 |
| 53.3.5.12 | Asynchronous Notification..... | 4539 |
| 53.3.5.13 | BIST Operation..... | 4539 |
| 53.3.5.14 | Loopback Responder..... | 4540 |
| 53.3.5.14.1 | Loopback Initiator..... | 4541 |
| 53.3.5.14.1.1 | Far-end retimed..... | 4542 |
| 53.3.5.14.1.2 | Far-end analog..... | 4543 |
| 53.3.5.14.1.3 | Near-end analog..... | 4543 |
| 53.3.5.14.1.4 | Far-end transmit only..... | 4543 |
| 53.3.5.15 | Command Completion Coalescing..... | 4544 |
| 53.4 | Programming..... | 4545 |
| 53.4.1 | Firmware Specific Initialization..... | 4545 |

| Section number | Title | Page |
|----------------|--|------|
| 53.4.2 | System software Specific Initialization..... | 4546 |
| 53.5 | Software Manipulation of Port DMA..... | 4547 |
| 53.5.1 | Start (SATA_P0CMD[ST])..... | 4548 |
| 53.5.2 | FIS Receive Enable (SATA_P0CMD[FRE])..... | 4548 |
| 53.6 | Register Descriptions..... | 4549 |
| 53.6.1 | Register Overview..... | 4549 |
| 53.6.1.1 | Register Basics:..... | 4549 |
| 53.6.1.2 | Reserved Locations..... | 4549 |
| 53.7 | SATA Memory Map/Register Definition..... | 4550 |
| 53.7.1 | HBA Capabilities Register (SATA_CAP)..... | 4552 |
| 53.7.2 | Global HBA Control Register (SATA_GHC)..... | 4555 |
| 53.7.3 | Interrupt Status Register (SATA_IS)..... | 4556 |

| 53.7.32 | Port0 DMA Control Register (SATA_P0DMACR)..... | 4592 |
| 53.7.33 | Port0 PHY Control Register (SATA_P0PHYCR)..... | 4594 |
| 53.7.34 | Port0 PHY Status Register (SATA_P0PHYSR)..... | 4595 |

Chapter 54

Serial Advanced Technology Attachment PHY (SATA PHY)

| | | |
|----------|----------------------------------|------|
| 54.1 | Overview..... | 4597 |
| 54.1.1 | General Product Description..... | 4597 |
| 54.1.1.1 | System Overview..... | 4597 |
| 54.1.2 | Features..... | 4597 |
| 54.1.3 | Block Diagram..... | 4599 |
| 54.1.4 | Block Descriptions..... | 4600 |
| 54.2 | External Signals..... | 4603 |
| 54.3 | Functional Description..... | 4603 |
| 54.3.1 | Power Controls..... | 4603 |
| 54.3.1.1 | Tx Power Controls..... | 4603 |
| 54.3.1.2 | Rx Power Controls..... | 4604 |
| 54.3.1.3 | Clock Module Power Controls..... | 4605 |

| Section number | Title | Page |
|----------------|---|------|
| 54.3.1.4 | Power-Up Sequences..... | 4606 |
| 54.3.1.4.1 | Powering Up the Chip (Initial Power-Up)..... | 4606 |
| 54.3.1.4.2 | Powering Up the Clock Module..... | 4607 |
| 54.3.1.4.3 | Powering Up the Tx..... | 4607 |
| 54.3.1.4.4 | Powering Up the Rx..... | 4607 |
| 54.3.1.5 | Power-Down Sequences..... | 4607 |
| 54.3.1.5.1 | Powering Down the Rx..... | 4607 |
| 54.3.1.5.2 | Powering Down the Tx..... | 4608 |
| 54.3.1.5.3 | Powering Down the Clock Module..... | 4608 |
| 54.3.2 | Clock Module Operations..... | 4608 |
| 54.3.3 | Clock Inputs to the SATA2 PHY..... | 4610 |
| 54.3.3.1 | mpll_prescale[1:0]..... | 4610 |
| 54.3.3.2 | Valid refclk Range and Formulaic MPLL Settings..... | 4610 |
| 54.3.3.3 | Clock Module Power Control..... | 4613 |
| 54.3.3.4 | Presence of refclk Signal..... | 4613 |
| 54.3.3.5 | Power-On Reset..... | 4613 |
| 54.3.3.6 | Resistor Calibration..... | 4614 |
| 54.3.4 | Tx Operations..... | 4614 |
| 54.3.4.1 | Recommended Tx Settings..... | 4614 |
| 54.3.4.2 | Tx Amplitude Control..... | 4614 |
| 54.3.4.3 | Tx Boost Control..... | 4615 |
| 54.3.4.4 | Tx Far-End Amplitude..... | 4616 |
| 54.3.4.5 | Tx Edge Rate Control..... | 4616 |
| 54.3.5 | Rx Operations..... | 4616 |
| 54.3.5.1 | Recommended Rx Settings..... | 4617 |
| 54.3.5.2 | Loss of Signal Detection..... | 4617 |
| 54.3.5.3 | rx_dpll_mode[2:0]..... | 4619 |
| 54.3.5.4 | Rx Equalizer Settings..... | 4620 |

| Section number | Title | Page |
|----------------|---|------|
| 54.4 | Control Registers..... | 4620 |
| 54.4.1 | Register Fields..... | 4621 |
| 54.4.1.1 | Field Properties..... | 4621 |
| 54.4.1.2 | Field Names..... | 4622 |
| 54.4.1.3 | Read/Modify/Write Operations..... | 4622 |
| 54.5 | Timing and Specifications..... | 4623 |
| 54.5.1 | SATA2 PHY Implementation-Specific Timing..... | 4623 |
| 54.5.1.1 | Synchronous Tx Inputs..... | 4624 |
| 54.5.1.2 | Synchronous Rx Outputs..... | 4624 |
| 54.5.1.3 | Asynchronous Tx and Rx I/O..... | 4625 |
| 54.5.1.4 | Control Register Bus Interface..... | 4625 |
| 54.5.1.5 | JTAG Interface Timing..... | 4626 |
| 54.5.2 | Silicon Testing..... | 4627 |
| 54.5.2.1 | Boundary Scan Port..... | 4627 |
| 54.5.2.1.1 | Per-Lane Block Diagram..... | 4627 |
| 54.5.2.2 | JTAG Interface Silicon Testing..... | 4629 |
| 54.5.2.2.1 | Interface Options..... | 4629 |
| 54.5.2.2.2 | Resets..... | 4629 |
| 54.5.2.2.3 | IR Codes..... | 4629 |
| 54.5.2.2.4 | ID Code..... | 4630 |
| 54.5.2.2.5 | USER Code..... | 4630 |
| 54.5.2.2.6 | Control Register Operations..... | 4630 |
| 54.5.2.2.7 | JTAG Override Register (jtag_ovrd)..... | 4631 |
| 54.5.2.3 | Parallel CR Control Port Testing..... | 4632 |
| 54.5.2.3.1 | Addressing..... | 4633 |
| 54.5.2.3.2 | Register Write..... | 4634 |
| 54.5.2.3.3 | Register Read..... | 4634 |

| Section number | Title | Page |
|----------------|---|------|
| 54.5.2.4 | Diagnostic Features..... | 4635 |
| 54.5.2.4.1 | Loopback Functions..... | 4636 |
| 54.5.2.4.1.1 | Rx-to-Tx Parallel Data Loopback..... | 4637 |
| 54.5.2.4.1.2 | Tx-to-Rx Digital Serial Data Loopback..... | 4637 |
| 54.5.2.4.1.3 | Tx-to-Rx Serial Analog Loopback..... | 4637 |
| 54.5.2.4.1.4 | Full Analog Loopback for In-Package ATE Test..... | 4638 |
| 54.5.2.4.2 | Asynchronous Operation..... | 4638 |
| 54.5.2.4.3 | Byte Error Rate Tester..... | 4638 |
| 54.5.2.4.3.1 | BERT Pattern Generator..... | 4639 |
| 54.5.2.4.3.2 | BERT Pattern Matcher and Error Counter..... | 4639 |
| 54.5.2.4.4 | Margining..... | 4640 |
| 54.5.2.4.4.1 | Phase Margining..... | 4641 |
| 54.5.2.4.5 | Scope Function..... | 4643 |
| 54.5.2.4.6 | Analog DC Test Capabilities..... | 4644 |
| 54.5.2.4.6.1 | Analog Test Bus..... | 4644 |
| 54.5.2.4.6.2 | 10-Bit DAC..... | 4646 |
| 54.5.2.4.6.3 | 10-Bit ADC..... | 4646 |
| 54.5.2.4.7 | Limit Testing..... | 4646 |
| 54.5.2.4.8 | Integrated Test Modes..... | 4647 |

| 54.5.2.4.8.2 | Bypass Test Mode..... | 4647 |
| 54.5.2.4.8.3 | Burn-In Test Mode..... | 4648 |
| 54.5.2.4.9 | Burn-In Test Requirements..... | 4648 |
| 54.5.2.5 | ATE Testing..... | 4648 |
| 54.6 | clock Memory Map/Register Definition..... | 4648 |
| 54.6.1 | Creg Compare Upper Limit Register (clock_CRCMP_LT_LIMIT)..... | 4650 |
| 54.6.2 | Creg Compare Lower Limit Register (clock_CRCMP_GT_LIMIT)..... | 4651 |
| 54.6.3 | Creg Compare Mask Register (clock_CRCMP_MASK)..... | 4651 |
| 54.6.4 | Creg Compare Control Register (clock_CRCMP_CTL)..... | 4652 |

| Section number | Title | Page |
|----------------|---|------|
| 54.6.5 | Creg Compare Status Register (clock_CRCMP_STAT)..... | 4652 |
| 54.6.6 | Scope Sample Count Register (clock_SCOPE_SAMPLES)..... | 4653 |
| 54.6.7 | Scope Count Result Register (clock_SCOPE_COUNT)..... | 4654 |
| 54.6.8 | DAC Control Register (clock_DAC_CTL)..... | 4654 |
| 54.6.9 | Resistor Tuning Control Register (clock_RTUNE_CTL)..... | 4655 |
| 54.6.10 | ADC Output Register (clock_ADC_OUT)..... | 4656 |
| 54.6.11 | Spread Spectrum Phase Register (clock_SS_PHASE)..... | 4657 |
| 54.6.12 | JTAG Chip ID (High Bits) Register (clock_CHIP_ID_HI)..... | 4657 |
| 54.6.13 | JTAG Chip ID (Low Bits) Register (clock_CHIP_ID_LOW)..... | 4658 |
| 54.6.14 | Frequency Status Register (clock_FREQ_STAT)..... | 4658 |
| 54.6.15 | Control Status Register (clock_CTL_STAT)..... | 4659 |
| 54.6.16 | Level Status Register (clock_LVL-STAT)..... | 4661 |
| 54.6.17 | Creg Status Register (clock_CREG_STAT)..... | 4662 |
| 54.6.18 | Frequency Override Register (clock_FREW_OVRD)..... | 4663 |
| 54.6.19 | Control Override Register (clock_CTL_OVRD)..... | 4664 |
| 54.6.20 | Level Override Register (clock_LVL_OVRD)..... | 4665 |
| 54.6.21 | Creg Override Register (clock_CREG_OVRD)..... | 4665 |
| 54.6.22 | MPLL Control Register (clock_MPLL_CTL)..... | 4666 |
| 54.6.23 | MPLL Test Register (clock_MPLL_TEST)..... | 4668 |
| 54.6.24 | Spread Spectrum Frequency Register (clock_SS_FREQ)..... | 4669 |
| 54.6.25 | Clock Select Status Register (clock_SEL_STAT)..... | 4669 |
| 54.6.26 | Clock Select Override Register (clock_SEL_OVRD)..... | 4670 |
| 54.6.27 | Reset Register (clock_RESET)..... | 4671 |
| 54.7 | lane0 Memory Map/Register Definition..... | 4671 |
| 54.7.1 | Transmit Input Status Register (lane0_TX_STAT)..... | 4674 |
| 54.7.2 | Receiver Input Status Register (lane0_RX_STAT)..... | 4675 |
| 54.7.3 | Output Status Register (lane0_OUT_STAT)..... | 4676 |
| 54.7.4 | Transmit Input Override Register (lane0_TX_OVRD)..... | 4677 |
| 54.7.5 | Receive Input Override Register (lane0_RX_OVRD)..... | 4678 |

| Section number | Title | Page |
|----------------|--|------|
| 54.7.6 | Output Override Register (lane0_OUT_OVRD)..... | 4679 |
| 54.7.7 | Debug Control Register (lane0_DBG_CTL)..... | 4680 |
| 54.7.8 | Pattern Generator Control Register (lane0_PG_CTL)..... | 4682 |
| 54.7.9 | Pattern Matcher Control Register (lane0_PM_CTL)..... | 4683 |
| 54.7.10 | Pattern Matcher Error Register (lane0_PM_ERR)..... | 4683 |
| 54.7.11 | DPLL Phase Register (lane0_DPLL_PHASE)..... | 4684 |
| 54.7.12 | DPLL Frequency Register (lane0_DPLL_FREQ)..... | 4684 |
| 54.7.13 | Scope Control Register (lane0_SCOPE_CTL)..... | 4685 |
| 54.7.14 | Receiver Control Register (lane0_RX_CTL)..... | 4686 |
| 54.7.15 | Receiver Debug Register (lane0_RX_DBG)..... | 4687 |
| 54.7.16 | Receive Analog Control Register (lane0_RX_ANA_CONTROL)..... | 4688 |
| 54.7.17 | Receive ATB Register (lane0_RX_ANA_ATB)..... | 4689 |
| 54.7.18 | Rx PLL Programming 2 Register (lane0_PLL_PRG2)..... | 4690 |
| 54.7.19 | Rx PLL Programming 1 Register (lane0_PLL_PRG1)..... | 4691 |
| 54.7.20 | Rx PLL Measurement Register (lane0_PLL_PRG3)..... | 4692 |
| 54.7.21 | Transmit ATB 1 Control Register (lane0_TX_ANA_ATBSEL1)..... | 4693 |
| 54.7.22 | Transmit ATB 2 Control Register (lane0_TX_ANA_ATBSEL2)..... | 4694 |
| 54.7.23 | Transmit Analog Control Register (lane0_TX_ANA_CONTROL)..... | 4695 |

Chapter 55

Smart Direct Memory Access Controller (SDMA)

| | | |
|----------|-----------------------------|------|
| 55.1 | Overview..... | 4697 |
| 55.1.1 | Block Diagram..... | 4697 |
| 55.1.2 | Features..... | 4699 |
| 55.2 | External Signals..... | 4701 |
| 55.3 | Clocks..... | 4701 |
| 55.4 | Functional Description..... | 4701 |
| 55.4.1 | SDMA Core..... | 4704 |
| 55.4.1.1 | SDMA Core Structure..... | 4704 |

| Section number | Title | Page |
|----------------|---|------|
| 55.4.1.2 | Program Control Unit (PCU)..... | 4707 |
| 55.4.1.2.1 | Instruction Types..... | 4707 |
| 55.4.1.2.2 | PCU States..... | 4708 |
| 55.4.1.3 | SDMA Core Memory..... | 4711 |
| 55.4.2 | Scheduler..... | 4711 |
| 55.4.2.1 | Primary Functions..... | 4711 |
| 55.4.2.2 | Channels and DMA Requests..... | 4712 |
| 55.4.2.2.1 | Channels..... | 4712 |
| 55.4.2.2.2 | DMA Requests..... | 4712 |
| 55.4.2.2.3 | Mapping from DMA Requests to Channels and Priorities..... | 4712 |
| 55.4.2.3 | Scheduler Functional Description..... | 4712 |
| 55.4.2.3.1 | Scheduler Overview..... | 4712 |
| 55.4.2.3.2 | DMA Requests Scanning..... | 4713 |
| 55.4.2.3.3 | Mapping DMA Requests to Pending Channels..... | 4714 |
| 55.4.2.3.4 | Channel Overflow..... | 4717 |
| 55.4.2.3.5 | Runnable Channels Evaluation..... | 4717 |
| 55.4.2.3.6 | Next Channel Decision Tree..... | 4719 |
| 55.4.2.3.7 | Scheduler State Diagram..... | 4721 |
| 55.4.2.3.8 | Scheduler Pipeline Timing Diagram..... | 4723 |
| 55.4.2.3.9 | Channel-DMA Request Mapping..... | 4723 |
| 55.4.2.3.10 | Examples: How to Start a Channel..... | 4723 |
| 55.4.2.4 | Context Switching..... | 4724 |
| 55.4.2.4.1 | Context Switch Modes..... | 4725 |
| 55.4.2.4.2 | Context Switch Procedure..... | 4725 |
| 55.4.2.4.3 | Context Map in Memory..... | 4727 |
| 55.4.3 | Functional Units..... | 4727 |
| 55.4.3.1 | Burst DMA Unit..... | 4727 |
| 55.4.3.1.1 | Burst DMA Structure..... | 4728 |
| 55.4.3.1.2 | Burst DMA Registers..... | 4729 |

| Section number | Title | Page |
|----------------|---|------|
| 55.4.3.1.3 | Burst DMA Data Transfers..... | 4730 |
| 55.4.3.1.3.1 | Data Retrieval from the ARM platform Memory..... | 4730 |
| 55.4.3.1.3.2 | Storing Data Into the ARM platform Memory..... | 4730 |
| 55.4.3.1.3.3 | Transferring Data Between Two ARM platform Memory Locations-Burst DMA Unit..... | 4731 |
| 55.4.3.2 | Peripheral DMA Unit..... | 4731 |
| 55.4.3.2.1 | Peripheral DMA Structure..... | 4732 |
| 55.4.3.2.2 | Peripheral DMA Registers..... | 4733 |
| 55.4.3.2.3 | Peripheral DMA Data Transfers..... | 4734 |
| 55.4.3.2.3.1 | Data Retrieval from the ARM platform Memory or Peripheral..... | 4734 |
| 55.4.3.2.3.2 | Storing Data into the ARM platform Memory or Peripheral. | 4734 |
| 55.4.3.2.3.3 | Transferring Data Between Two ARM platform Memory Locations-Peripheral DMA Unit..... | 4735 |
| 55.4.4 | SDMA Security Support..... | 4735 |
| 55.4.4.1 | Locked Mode..... | 4735 |
| 55.4.5 | OnCE and PCU Debug States..... | 4736 |
| 55.4.6 | SDMA Clocks and Low Power Modes..... | 4738 |
| 55.4.6.1 | Clock Gating and Low Power Modes..... | 4739 |
| 55.4.6.1.1 | Coarse Clock Gating..... | 4739 |
| 55.4.6.1.2 | Refined Clock Gating..... | 4740 |
| 55.4.6.1.3 | Low Power Modes and User Control..... | 4740 |
| 55.4.6.1.3.1 | SLEEP Mode..... | 4741 |
| 55.4.6.1.3.2 | RUN Mode..... | 4741 |
| 55.4.6.1.3.3 | DEBUG Mode..... | 4742 |
| 55.4.6.1.4 | Stop Mode Response..... | 4742 |
| 55.4.6.2 | Reset..... | 4742 |
| 55.4.7 | Software Interface..... | 4742 |
| 55.4.8 | Initialization Information..... | 4743 |
| 55.4.8.1 | Hardware Reset..... | 4743 |

| Section number | Title | Page |

| 57.9.17 | SNVS_LP General Purpose Register (SNVS_LPGPR)..... | 5009 |
| 57.9.18 | SNVS_HP Version ID Register 1 (SNVS_HPVIDR1)..... | 5009 |
| 57.9.19 | SNVS_HP Version ID Register 2 (SNVS_HPVIDR2)..... | 5010 |

Chapter 58 Shared Peripheral Bus Arbiter (SPBA)

| | | |
|----------|--|------|
| 58.1 | Overview..... | 5011 |
| 58.1.1 | Features..... | 5013 |
| 58.1.2 | Modes of operation..... | 5014 |
| 58.2 | Clocks..... | 5014 |
| 58.3 | Functional description..... | 5015 |
| 58.3.1 | Masters arbitration..... | 5015 |
| 58.4 | Resource ownership control..... | 5018 |
| 58.4.1 | Access control | 5018 |
| 58.4.1.1 | Peripheral access..... | 5018 |
| 58.4.1.2 | Peripheral Right Register access..... | 5019 |
| 58.4.2 | Owner election..... | 5020 |
| 58.4.3 | Ending ownership..... | 5020 |
| 58.4.3.1 | Software Controlled Ownership Ending..... | 5020 |
| 58.4.4 | The Un-owned State..... | 5021 |
| 58.5 | SPBA Memory Map/Register Definition..... | 5021 |
| 58.5.1 | Peripheral Rights Register (SPBA_PRR _n)..... | 5023 |

Chapter 59 Sony/Philips Digital Interface (SPDIF)

| | | |
|--------|-----------------------|------|
| 59.1 | Introduction | 5025 |
| 59.1.1 | Overview..... | 5027 |
| 59.2 | External Signals..... | 5028 |
| 59.3 | Clocks..... | 5029 |

| Section number | Title | Page |
|----------------|--|------|
| 59.4 | Functional Description..... | 5029 |
| 59.4.1 | SPDIF Receiver..... | 5029 |
| 59.4.1.1 | Audio Data Reception..... | 5030 |
| 59.4.1.1.1 | Application Note..... | 5031 |
| 59.4.1.2 | Channel Status Reception..... | 5033 |
| 59.4.1.2.1 | Channel Status Interrupt..... | 5033 |
| 59.4.1.3 | User Bit Reception..... | 5033 |
| 59.4.1.4 | Validity Flag Reception..... | 5035 |
| 59.4.1.5 | SPDIF Receiver Interrupt Exception Definition..... | 5036 |
| 59.4.1.6 | Standards Compliance..... | 5036 |
| 59.4.1.7 | SPDIF PLOCK Detection and Rxclk Output..... | 5037 |
| 59.4.1.8 | Measuring Frequency of SPDIF_RxClk..... | 5037 |
| 59.4.2 | SPDIF Transmitter..... | 5038 |
| 59.4.2.1 | Audio Data Transmission..... | 5038 |
| 59.4.2.2 | Channel Status Transmission..... | 5039 |
| 59.4.2.3 | Validity Flag Transmission..... | 5039 |
| 59.5 | SPDIF Memory Map/Register Definition..... | 5039 |
| 59.5.1 | SPDIF Configuration Register (SPDIF_SCR)..... | 5041 |
| 59.5.2 | CDText Control Register (SPDIF_SRCD)..... | 5043 |
| 59.5.3 | PhaseConfig Register (SPDIF_SRPC)..... | 5044 |
| 59.5.4 | InterruptEn Register (SPDIF_SIE)..... | 5045 |
| 59.5.5 | InterruptStat Register (SPDIF_SIS)..... | 5047 |
| 59.5.6 | InterruptClear Register (SPDIF_SIC)..... | 5049 |
| 59.5.7 | SPDIFRxLeft Register (SPDIF_SRL)..... | 5050 |
| 59.5.8 | SPDIFRxRight Register (SPDIF_SRR)..... | 5051 |
| 59.5.9 | SPDIFRxCCchannel_h Register (SPDIF_SRC SH)..... | 5051 |
| 59.5.10 | SPDIFRxCCchannel_l Register (SPDIF_SRC SL)..... | 5052 |
| 59.5.11 | UchannelRx Register (SPDIF_SR U)..... | 5052 |
| 59.5.12 | QchannelRx Register (SPDIF_SR Q)..... | 5053 |

| Section number | Title | Page |
|----------------|--|------|
| 59.5.13 | SPDIFTxLeft Register (SPDIF_STL)..... | 5053 |
| 59.5.14 | SPDIFTxRight Register (SPDIF_STR)..... | 5054 |
| 59.5.15 | SPDIFTxCChannelCons_h Register (SPDIF_STCSCH)..... | 5054 |
| 59.5.16 | SPDIFTxCChannelCons_l Register (SPDIF_STCSCL)..... | 5055 |
| 59.5.17 | FreqMeas Register (SPDIF_SRFM)..... | 5055 |
| 59.5.18 | SPDIFTxClk Register (SPDIF_STC)..... | 5056 |

Chapter 60 System Reset Controller (SRC)

| | | |
|------------|--|------|
| 60.1 | SRC Overview..... | 5059 |
| 60.1.1 | Features..... | 5059 |
| 60.2 | External Signals..... | 5059 |
| 60.3 | Clocks..... | 5060 |
| 60.4 | Top-level resets, power-up sequence and external supply integration..... | 5061 |
| 60.4.1 | Reset and Power-up Flow..... | 5061 |
| 60.4.2 | Finite-State Machine (FSM)..... | 5064 |
| 60.4.3 | Power mode transitions..... | 5065 |
| 60.5 | Power-On Reset and power sequencing..... | 5066 |
| 60.5.1 | External POR using SRC_POR_B..... | 5066 |
| 60.5.2 | Internal POR..... | 5067 |
| 60.6 | Functional Description..... | 5067 |
| 60.6.1 | Reset Control..... | 5067 |
| 60.6.1.1 | Reset inputs and outputs..... | 5067 |
| 60.6.1.2 | Reset Handling..... | 5069 |
| 60.6.1.2.1 | Reset Qualification..... | 5069 |
| 60.6.1.2.2 | Reset Sequence and De-Assertion..... | 5070 |
| 60.6.1.2.3 | POR (SRC_POR_B)..... | 5070 |
| 60.6.1.2.4 | COLD RESET..... | 5071 |
| 60.6.1.2.5 | WARM RESET..... | 5072 |
| 60.6.2 | Parallel Reset Requests..... | 5073 |

| Section number | Title | Page |
|----------------|--|------|
| 60.6.3 | Boot Mode Control..... | 5074 |
| 60.6.3.1 | BOOT_MODE Pin Latching..... | 5074 |
| 60.7 | SRC Memory Map/Register Definition..... | 5075 |
| 60.7.1 | SRC Control Register (SRC_SCR)..... | 5076 |
| 60.7.2 | SRC Boot Mode Register 1 (SRC_SBMR1)..... | 5080 |
| 60.7.3 | SRC Reset Status Register (SRC_SRSR)..... | 5081 |
| 60.7.4 | SRC Interrupt Status Register (SRC_SISR)..... | 5083 |
| 60.7.5 | SRC Interrupt Mask Register (SRC_SIMR)..... | 5085 |
| 60.7.6 | SRC Boot Mode Register 2 (SRC_SBMR2)..... | 5086 |
| 60.7.7 | SRC General Purpose Register 1 (SRC_GPR1)..... | 5087 |
| 60.7.8 | SRC General Purpose Register 2 (SRC_GPR2)..... | 5087 |
| 60.7.9 | SRC General Purpose Register 3 (SRC_GPR3)..... | 5088 |
| 60.7.10 | SRC General Purpose Register 4 (SRC_GPR4)..... | 5088 |
| 60.7.11 | SRC General Purpose Register 5 (SRC_GPR5)..... | 5088 |
| 60.7.12 | SRC General Purpose Register 6 (SRC_GPR6)..... | 5089 |
| 60.7.13 | SRC General Purpose Register 7 (SRC_GPR7)..... | 5089 |
| 60.7.14 | SRC General Purpose Register 8 (SRC_GPR8)..... | 5089 |
| 60.7.15 | SRC General Purpose Register 9 (SRC_GPR9)..... | 5090 |
| 60.7.16 | SRC General Purpose Register 10 (SRC_GPR10)..... | 5091 |

Chapter 61 Synchronous Serial Interface (SSI)

| | | |
|--------|---|------|
| 61.1 | Overview..... | 5093 |
| 61.1.1 | Features..... | 5094 |
| 61.1.2 | Modes of Operation..... | 5095 |
| 61.2 | External Signal Description..... | 5095 |
| 61.2.1 | Signals Overview..... | 5095 |
| 61.3 | Clocks..... | 5099 |
| 61.4 | SSI Transmit FIFO 0 & 1 Registers..... | 5099 |
| 61.5 | SSI Transmit Shift Register (TXSR)..... | 5100 |

| Section number | Title | Page |
|----------------|--|------|
| 61.6 | SSI Receive FIFO 0 and 1 Registers..... | 5102 |
| 61.7 | SSI Receive Shift Register (RXSR)..... | 5103 |
| 61.8 | Functional Description..... | 5105 |
| 61.8.1 | Operating Modes..... | 5105 |
| 61.8.1.1 | Normal Mode..... | 5107 |
| 61.8.1.1.1 | Normal Mode Transmit..... | 5107 |
| 61.8.1.1.2 | Normal Mode Receive..... | 5108 |
| 61.8.1.2 | Network Mode..... | 5110 |
| 61.8.1.2.1 | Network Mode Transmit..... | 5111 |
| 61.8.1.2.2 | Network Mode Receive..... | 5112 |
| 61.8.1.3 | Gated Clock Mode..... | 5114 |
| 61.8.1.4 | I2S Mode..... | 5117 |
| 61.8.1.5 | AC97 Mode..... | 5119 |
| 61.8.1.5.1 | AC97 Fixed Mode (SSI.SACNT[1]=0)..... | 5121 |
| 61.8.1.5.2 | AC97 Variable Mode (SSI.SACNT[1]=1)..... | 5121 |
| 61.8.2 | External Frame and Clock Operation..... | 5122 |
| 61.8.2.1 | Data Alignment Formats Supported..... | 5122 |
| 61.8.3 | SSI Architecture..... | 5123 |
| 61.8.4 | SSI Clocking..... | 5124 |
| 61.8.4.1 | SSI Clock and Frame Sync Generation..... | 5125 |
| 61.8.4.2 | DIV2, PSR and PM Bit Description..... | 5126 |
| 61.8.5 | Receive Interrupt Enable Bit Description..... | 5128 |
| 61.8.6 | Transmit Interrupt Enable Bit Description..... | 5129 |
| 61.8.7 | Internal Frame and Clock Shutdown..... | 5130 |
| 61.8.8 | Peripheral Bus Interface..... | 5132 |
| 61.8.8.1 | Transfer Lengths Supported..... | 5132 |
| 61.8.8.2 | Transfer Bus Errors..... | 5132 |
| 61.8.8.3 | Clock Rate..... | 5133 |
| 61.8.9 | Reset..... | 5133 |

| Section number | Title | Page |
|----------------|--|------|
| 61.9 | SSI Memory Map/Register Definition..... | 5133 |
| 61.9.1 | SSI Transmit Data Register n (SSIx_STXn)..... | 5136 |
| 61.9.2 | SSI Receive Data Register n (SSIx_SRXn)..... | 5136 |
| 61.9.3 | SSI Control Register (SSIx_SCR)..... | 5137 |
| 61.9.4 | SSI Interrupt Status Register (SSIx_SISR)..... | 5139 |
| 61.9.5 | SSI Interrupt Enable Register (SSIx_SIER)..... | 5145 |
| 61.9.6 | SSI Transmit Configuration Register (SSIx_STCR)..... | 5149 |
| 61.9.7 | SSI Receive Configuration Register (SSIx_SRCR)..... | 5151 |
| 61.9.8 | SSI Transmit Clock Control Register (SSIx_STCCR)..... | 5153 |
| 61.9.9 | SSI Receive Clock Control Register (SSIx_SRCCR)..... | 5155 |
| 61.9.10 | SSI FIFO Control/Status Register (SSIx_SFCSR)..... | 5156 |
| 61.9.11 | SSI AC97 Control Register (SSIx_SACNT)..... | 5160 |
| 61.9.12 | SSI AC97 Command Address Register (SSIx_SACADD)..... | 5161 |
| 61.9.13 | SSI AC97 Command Data Register (SSIx_SACDAT)..... | 5161 |
| 61.9.14 | SSI AC97 Tag Register (SSIx_SATAG)..... | 5162 |
| 61.9.15 | SSI Transmit Time Slot Mask Register (SSIx_STMSK)..... | 5162 |
| 61.9.16 | SSI Receive Time Slot Mask Register (SSIx_SRMSK)..... | 5163 |
| 61.9.17 | SSI AC97 Channel Status Register (SSIx_SACCST)..... | 5163 |
| 61.9.18 | SSI AC97 Channel Enable Register (SSIx_SACCEN)..... | 5164 |
| 61.9.19 | SSI AC97 Channel Disable Register (SSIx_SACCDIS)..... | 5164 |

Chapter 62

Temperature Monitor (TEMPMON)

| | | |
|--------|--|------|
| 62.1 | Overview..... | 5165 |
| 62.2 | Software Usage Guidelines..... | 5166 |
| 62.3 | TEMPMON Memory Map/Register Definition..... | 5167 |
| 62.3.1 | Tempsensor Control Register 0 (TEMPMON_TEMPSENSE0n)..... | 5168 |
| 62.3.2 | Tempsensor Control Register 1 (TEMPMON_TEMPSENSE1n)..... | 5170 |

Chapter 63

TrustZone Address Space Controller (TZASC)

| | | |
|------|--|------|
| 63.1 | Overview..... | 5171 |
| 63.2 | Clocks..... | 5172 |
| 63.3 | i.MX 6Dual/6Quad Specific Configuration | 5172 |
| 63.4 | Address Mapping in various memory mapping modes..... | 5173 |

Chapter 64

Universal Asynchronous Receiver/Transmitter (UART)

| | | |
|------------|---|------|
| 64.1 | Overview..... | 5175 |
| 64.1.1 | Features..... | 5176 |
| 64.1.2 | Modes of Operation..... | 5177 |
| 64.2 | External Signals..... | 5177 |
| 64.2.1 | Detailed Signal Descriptions..... | 5179 |
| 64.2.1.1 | Serial/IrDA Signals..... | 5179 |
| 64.2.1.1.1 | RXD - Data Receive..... | 5179 |
| 64.2.1.1.2 | TXD - Data Transmit..... | 5179 |
| 64.2.1.2 | Modem Control Signals..... | 5179 |
| 64.2.1.2.1 | CTS - Clear To Send | 5179 |
| 64.2.1.2.2 | RTS - Request To Send..... | 5180 |
| 64.2.1.2.3 | DSR - Data Set Ready..... | 5180 |
| 64.2.1.2.4 | DCD - Data Carrier Detected..... | 5180 |
| 64.2.1.2.5 | DTR - Data Terminal Ready..... | 5180 |
| 64.2.1.2.6 | RI - Ring Indicator..... | 5180 |
| 64.2.1.3 | Interrupt Signals..... | 5180 |
| 64.2.1.3.1 | interrupt_uart - UART Interrupt..... | 5180 |
| 64.2.1.4 | DMA Request Signals..... | 5181 |
| 64.2.1.4.1 | dma_req_rx - Receiver DMA Request..... | 5181 |
| 64.2.1.4.2 | dma_req_tx - Transmitter DMA Request..... | 5181 |

| Section number | Title | Page |
|----------------|---|------|
| 64.2.1.5 | Special Signals..... | 5181 |
| 64.2.1.5.1 | stop_req - Stop Mode..... | 5181 |
| 64.2.1.5.2 | doze_req - Doze Mode..... | 5181 |
| 64.2.1.5.3 | debug_req - Debug Mode..... | 5181 |
| 64.3 | Clocks..... | 5181 |
| 64.4 | Functional Description..... | 5182 |
| 64.4.1 | Interrupts and DMA Requests..... | 5182 |
| 64.4.2 | Clocks..... | 5183 |
| 64.4.2.1 | Clock requirements..... | 5183 |
| 64.4.2.2 | Maximum Baud Rate..... | 5184 |
| 64.4.2.3 | Clocking in Low-Power Modes..... | 5184 |
| 64.4.3 | General UART Definitions..... | 5185 |
| 64.4.3.1 | RTS_B - UART Request To Send..... | 5186 |
| 64.4.3.2 | RTS Edge Triggered Interrupt..... | 5186 |
| 64.4.3.3 | DTR_B - Data Terminal Ready | 5187 |
| 64.4.3.4 | DSR_B - Data Set Ready..... | 5187 |
| 64.4.3.5 | DTR_B/DSR_B Edge Triggered Interrupt..... | 5188 |
| 64.4.3.6 | DCD_B - Data Carrier Detect..... | 5188 |
| 64.4.3.7 | RI_B - Ring Indicator..... | 5189 |
| 64.4.3.8 | CTS_B - Clear To Send..... | 5189 |
| 64.4.3.9 | Programmable CTS_B Deassertion..... | 5189 |
| 64.4.3.10 | TX_DATA - UART Transmit..... | 5189 |
| 64.4.3.11 | RX_DATA - UART Receive..... | 5190 |
| 64.4.4 | Transmitter..... | 5192 |
| 64.4.4.1 | Transmitter FIFO Empty Interrupt Suppression..... | 5192 |
| 64.4.4.2 | Transmitting a Break Condition..... | 5194 |
| 64.4.5 | Receiver..... | 5194 |
| 64.4.5.1 | Idle Line Detect..... | 5195 |
| 64.4.5.2 | Aging Character Detect..... | 5196 |

| Section number | Title | Page |
|----------------|---|------|
| 64.4.5.3 | Receiver Wake..... | 5197 |
| 64.4.5.4 | Receiving a BREAK Condition..... | 5198 |
| 64.4.5.5 | Vote Logic..... | 5198 |
| 64.4.5.6 | Baud Rate Automatic Detection Logic..... | 5200 |
| 64.4.5.6.1 | Baud Rate Automatic Detection Protocol..... | 5201 |
| 64.4.5.6.2 | New Baud Rate Determination..... | 5201 |
| 64.4.5.6.2.1 | New Autobaud Counter Stopped bit and Interrupt..... | 5202 |
| 64.4.6 | Escape Sequence Detection..... | 5202 |
| 64.5 | Binary Rate Multiplier (BRM)..... | 5204 |
| 64.6 | Infrared Interface..... | 5206 |
| 64.6.1 | Generalities-Infrared..... | 5206 |
| 64.6.2 | Inverted Transmission and Reception bits (INVT & INVR)..... | 5207 |
| 64.6.3 | InfraRed Special Case (IRSC) Bit..... | 5207 |
| 64.6.4 | IrDA interrupt..... | 5208 |
| 64.6.5 | Conclusion about IrDA..... | 5209 |
| 64.6.6 | Programming IrDA Interface..... | 5210 |
| 64.6.6.1 | High Speed..... | 5210 |
| 64.6.6.2 | Low Speed..... | 5210 |
| 64.7 | 9-bit RS-485 Mode..... | 5211 |
| 64.7.1 | Generalities..... | 5211 |
| 64.7.2 | Transmit 9-bit RS-485 frames..... | 5212 |
| 64.7.3 | Receive 9-bit RS-485 frames..... | 5212 |
| 64.7.3.1 | RS-485 Slave Address Normal Detect Mode..... | 5212 |
| 64.7.3.2 | RS-485 Slave Address Automatic Detect Mode..... | 5213 |
| 64.8 | Low Power Modes..... | 5213 |
| 64.8.1 | UART Operation in System Doze Mode..... | 5214 |
| 64.8.2 | UART Operation in System Stop Mode..... | 5214 |
| 64.8.3 | Power Saving Method in UART..... | 5215 |
| 64.9 | UART Operation in System Debug State..... | 5215 |

| Section number | Title | Page |
|----------------|---|------|
| 64.10 | Reset..... | 5216 |
| 64.10.1 | Hardware reset..... | 5216 |
| 64.10.2 | Software reset..... | 5216 |
| 64.11 | Transfer Error..... | 5216 |
| 64.12 | Functional Timing..... | 5217 |
| 64.12.1 | IrDA Mode..... | 5217 |
| 64.13 | Initialization..... | 5217 |
| 64.13.1 | Programming the UART in RS-232 mode..... | 5217 |
| 64.13.2 | Programming the UART in 9-bit RS-485 mode..... | 5219 |
| 64.14 | References..... | 5220 |
| 64.15 | UART Memory Map/Register Definition..... | 5221 |
| 64.15.1 | UART Receiver Register (UARTx_URXD)..... | 5226 |
| 64.15.2 | UART Transmitter Register (UARTx_UTXD)..... | 5228 |
| 64.15.3 | UART Control Register 1 (UARTx_UCR1)..... | 5229 |
| 64.15.4 | UART Control Register 2 (UARTx_UCR2)..... | 5231 |
| 64.15.5 | UART Control Register 3 (UARTx_UCR3)..... | 5234 |
| 64.15.6 | UART Control Register 4 (UARTx_UCR4)..... | 5236 |
| 64.15.7 | UART FIFO Control Register (UARTx_UFCR)..... | 5238 |
| 64.15.8 | UART Status Register 1 (UARTx_USR1)..... | 5240 |
| 64.15.9 | UART Status Register 2 (UARTx_USR2)..... | 5243 |
| 64.15.10 | UART Escape Character Register (UARTx_UESC)..... | 5245 |
| 64.15.11 | UART Escape Timer Register (UARTx_UTIM)..... | 5246 |
| 64.15.12 | UART BRM Incremental Register (UARTx_UBIR)..... | 5246 |
| 64.15.13 | UART BRM Modulator Register (UARTx_UBMR)..... | 5247 |
| 64.15.14 | UART Baud Rate Count Register (UARTx_UBRC)..... | 5247 |
| 64.15.15 | UART One Millisecond Register (UARTx_ONEMS)..... | 5248 |
| 64.15.16 | UART Test Register (UARTx_UTS)..... | 5249 |
| 64.15.17 | UART RS-485 Mode Control Register (UARTx_UMCR)..... | 5250 |

| Section number | Title | Page |
|--|---|------|
| Chapter 65 | | |
| Universal Serial Bus Controller (USB) | | |
| 65.1 | Overview..... | 5253 |
| 65.1.1 | Features..... | 5254 |
| 65.1.2 | Modes of Operation..... | 5255 |
| 65.1.2.1 | Normal Mode..... | 5256 |
| 65.1.2.2 | Low-Power Mode..... | 5256 |
| 65.2 | External Signals..... | 5257 |
| 65.3 | Functional Description..... | 5257 |
| 65.3.1 | USB 2.0 Controller Core 0..... | 5258 |
| 65.3.1.1 | Host Mode..... | 5258 |
| 65.3.1.2 | Peripheral (Device) Mode..... | 5258 |
| 65.3.1.3 | Pins Used for OTG Controller..... | 5258 |
| 65.3.2 | USB 2.0 Controller Core 1..... | 5259 |
| 65.3.2.1 | Pins Used for Host Controller 1..... | 5259 |
| 65.3.3 | USB 2.0 Controller Core 2..... | 5259 |
| 65.3.4 | USB 2.0 Controller Core 3..... | 5259 |
| 65.3.5 | USB Power Control..... | 5260 |
| 65.3.5.1 | Entering Low Power Suspend Mode..... | 5260 |
| 65.3.5.2 | Wake-Up Events..... | 5261 |
| 65.3.5.2.1 | Host Mode Events..... | 5261 |
| 65.3.6 | Interrupts..... | 5262 |
| 65.3.6.1 | USB Core Interrupts..... | 5262 |
| 65.3.6.2 | USB Wake-Up Interrupts..... | 5262 |
| 65.4 | USB Operation Model..... | 5262 |
| 65.4.1 | Register Interface..... | 5263 |
| 65.4.1.1 | Configuration, Control and Status Register Set..... | 5263 |
| 65.4.1.2 | Identification Registers..... | 5265 |

| Section number | Title | Page |
|----------------|--|------|
| 65.4.1.3 | OTG Operations..... | 5265 |
| 65.4.1.3.1 | Register Bits..... | 5266 |
| 65.4.2 | Host Data Structures..... | 5267 |
| 65.4.2.1 | Periodic Frame List..... | 5267 |
| 65.4.2.2 | Asynchronous List Queue Head Pointer..... | 5269 |
| 65.4.2.3 | Isochronous (High-Speed) Transfer Descriptor (iTDD)..... | 5270 |
| 65.4.2.3.1 | Next Link Pointer..... | 5271 |

Chapter 66

Universal Serial Bus 2.0 Integrated PHY (USB-PHY)

| | | |
|----------|----------------------------------|------|
| 66.1 | USB PHY Overview..... | 5523 |
| 66.2 | Operation..... | 5524 |
| 66.2.1 | UTMI..... | 5525 |
| 66.2.2 | Digital Transmitter..... | 5525 |
| 66.2.3 | Digital Receiver..... | 5525 |
| 66.2.4 | Analog Receiver..... | 5525 |
| 66.2.4.1 | HS Differential Receiver..... | 5526 |
| 66.2.4.2 | Squelch Detector..... | 5527 |
| 66.2.4.3 | LS/FS Differential Receiver..... | 5527 |

| Section number | Title | Page |
|----------------|---|------|
| 66.2.4.4 | HS Disconnect Detector..... | 5527 |
| 66.2.4.5 | USB Plugged-In Detector..... | 5527 |
| 66.2.4.6 | Single-Ended USB_DP Receiver..... | 5528 |
| 66.2.4.7 | Single-Ended USB_DN Receiver..... | 5528 |
| 66.2.4.8 | 9X Oversample Module..... | 5528 |
| 66.2.5 | Analog Transmitter..... | 5528 |
| 66.2.5.1 | Switchable High-Speed 45Ω Termination Resistors..... | 5528 |
| 66.2.5.2 | Low-Speed/Full-Speed Differential Driver..... | 5529 |
| 66.2.5.3 | High-Speed Differential Driver..... | 5529 |
| 66.2.5.4 | Switchable 1.5KΩ USB_DP Pullup Resistor..... | 5529 |
| 66.2.5.5 | Switchable 15KΩ USB_DP Pulldown Resistor..... | 5529 |
| 66.2.6 | Recommended Register Configuration for USB Certification..... | 5531 |
| 66.2.7 | Charger detection..... | 5531 |
| 66.2.7.1 | Charger detect control table..... | 5531 |
| 66.2.7.2 | Data pin contact detector..... | 5531 |
| 66.2.7.3 | Charger detector..... | 5532 |
| 66.2.7.4 | Charger detection software flow..... | 5532 |
| 66.2.7.5 | Dead Battery Protect..... | 5534 |
| 66.3 | USB PHY Memory Map/Register Definition..... | 5534 |
| 66.3.1 | USB PHY Power-Down Register (USBPHY _x _PWD _n)..... | 5537 |
| 66.3.2 | USB PHY Transmitter Control Register (USBPHY _x _TX _n)..... | 5539 |
| 66.3.3 | USB PHY Receiver Control Register (USBPHY _x _RX _n)..... | 5540 |
| 66.3.4 | USB PHY General Control Register (USBPHY _x _CTRL _n)..... | 5542 |
| 66.3.5 | USB PHY Status Register (USBPHY _x _STATUS)..... | 5545 |
| 66.3.6 | USB PHY Debug Register (USBPHY _x _DEBUG _n)..... | 5547 |
| 66.3.7 | UTMI Debug Status Register 0 (USBPHY _x _DEBUG0_STATUS)..... | 5549 |

| 69.5.1.2.6 | Macroblock controller..... | 5722 |
| 69.5.1.2.7 | Rotation/Mirroring | 5723 |
| 69.5.1.2.8 | Cache..... | 5724 |
| 69.5.2 | Reset..... | 5726 |
| 69.5.3 | Interrupts..... | 5727 |
| 69.5.4 | Endianness..... | 5727 |
| 69.6 | Initialization Information..... | 5727 |
| 69.7 | Application Information..... | 5728 |
| 69.7.1 | Video Decoding Processing Control..... | 5729 |
| 69.7.1.1 | Video Decoding Process Flow..... | 5729 |
| 69.7.1.2 | Video Decoding Process Command..... | 5731 |
| 69.7.1.3 | Video Decoding Process Finish Detection..... | 5733 |
| 69.7.1.4 | Video Decoding Process Flow Example..... | 5733 |

| Section number | Title | Page |
|----------------|--|------|
| 69.7.2 | Video Encoding Processing Control..... | 5735 |
| 69.7.2.1 | The Pipeline for Encoding..... | 5735 |
| 69.7.3 | Video Codec Processing Buffer Requirement..... | 5739 |
| 69.7.3.1 | Memory Map Types of Frame Buffer..... | 5740 |
| 69.7.3.2 | Frame Buffer..... | 5741 |
| 69.7.3.3 | BIT Processor Program Buffer..... | 5744 |
| 69.7.3.4 | Working Buffer..... | 5744 |
| 69.7.3.5 | Bitstream Buffer..... | 5745 |
| 69.7.3.6 | Parameter Buffer..... | 5746 |
| 69.7.3.7 | Search RAM..... | 5746 |
| 69.7.3.8 | Buffer Requirement Summary..... | 5746 |
| 69.8 | VPU Memory Map/Register Definition..... | 5747 |
| 69.8.1 | BIT Processor run start (VPU_CodeRun)..... | 5749 |
| 69.8.2 | BIT Boot Code Download Data register (VPU_CodeDown)..... | 5749 |
| 69.8.3 | Host Interrupt Request to BIT (VPU_HostIntReq)..... | 5750 |
| 69.8.4 | BIT Interrupt Clear (VPU_BitIntClear)..... | 5751 |
| 69.8.5 | BIT Interrupt Status (VPU_BitIntSts)..... | 5752 |
| 69.8.6 | BIT Current PC (VPU_BitCurPc)..... | 5753 |
| 69.8.7 | BIT CODEC Busy (VPU_BitCodecBusy)..... | 5754 |

Chapter 70 Watchdog Timer (WDOG)

| | | |
|----------|---|------|
| 70.1 | Overview..... | 5755 |
| 70.1.1 | Features..... | 5756 |
| 70.2 | External signals..... | 5757 |
| 70.3 | Clocks..... | 5757 |
| 70.4 | Functional description..... | 5757 |
| 70.4.1 | Timeout event..... | 5758 |
| 70.4.1.1 | Servicing WDOG to reload the counter..... | 5758 |
| 70.4.2 | Interrupt event | 5759 |

| Section number | Title | Page |
|----------------|---|------|
| 70.4.3 | Power-down counter event..... | 5759 |
| 70.4.4 | Low power modes..... | 5759 |
| 70.4.4.1 | STOP and DOZE mode..... | 5759 |
| 70.4.4.2 | WAIT mode..... | 5760 |
| 70.4.5 | Debug mode..... | 5760 |
| 70.4.6 | Operations..... | 5760 |
| 70.4.6.1 | Watchdog reset generation..... | 5760 |
| 70.4.6.2 | WDOG_B generation..... | 5761 |
| 70.4.7 | Reset..... | 5763 |
| 70.4.8 | Interrupt..... | 5763 |
| 70.4.9 | Flow Diagrams..... | 5763 |
| 70.5 | Initialization..... | 5768 |
| 70.6 | WDOG Memory Map/Register Definition..... | 5769 |
| 70.6.1 | Watchdog Control Register (WDOGx_WCR)..... | 5769 |
| 70.6.2 | Watchdog Service Register (WDOGx_WSR)..... | 5771 |
| 70.6.3 | Watchdog Reset Status Register (WDOGx_WRSR)..... | 5772 |
| 70.6.4 | Watchdog Interrupt Control Register (WDOGx_WICR)..... | 5773 |
| 70.6.5 | Watchdog Miscellaneous Control Register (WDOGx_WMCR)..... | 5774 |

Chapter 71 Crystal Oscillator (XTALOSC)

| | | |
|--------|--|------|
| 71.1 | Overview..... | 5775 |
| 71.2 | External Signals..... | 5775 |
| 71.3 | Crystal Oscillator 24 MHz..... | 5776 |
| 71.3.1 | Oscillator Configuration (24 MHz)..... | 5776 |
| 71.3.2 | Bypass Configuration (24 MHz)..... | 5777 |
| 71.3.3 | Crystal Frequency Detection(24 MHz)..... | 5778 |
| 71.4 | Crystal Oscillator 32 kHz..... | 5778 |
| 71.4.1 | Oscillator Configuration (32 kHz)..... | 5778 |
| 71.4.2 | Bypass Configuration (32 kHz)..... | 5779 |

| Section number | Title | Page |
|----------------|---|------|
| 71.5 | XTALOSC 24MHz Memory Map/Register Definition..... | 5780 |
| 71.5.1 | Miscellaneous Register 0 (XTALOSC24M_MISC0)..... | 5781 |

Chapter 1

Introduction

1.1 About This Document

The i.MX 6Dual/6Quad application processors are Freescale Semiconductor's latest additions to a growing family of multimedia-focused products offering high performance processing optimized for lowest power consumption.

The i.MX 6Dual/6Quad processors feature Freescale's advanced implementation of the ARM[®]Cortex[®]-A9 core, which can be interfaced with DDR3-1066, LV-DDR3-1066 and LPDDR2-1066(single and dual channel) DRAM memory devices.

These products are suitable for applications such as:

- Automotive navigation and entertainment
- High-end Mobile Internet Devices and high-end PDAs
- Netbooks
- Nettops
- High-end portable media players with HD video capability
- Portable navigation devices
- Gaming Consoles

1.1.1 Audience

This manual is intended to be used by board-level product designers and product software developers. This manual assumes that the reader has a background in computer engineering and/or software engineering and understands concepts of digital system design, microprocessor architecture, Input / Output (I/O) devices, industry standard communication and device interface protocols.

1.1.2 Organization

This document covers the i.MX 6Dual/6Quad at a system level and provides an architectural overview. Also covered are system memory map, system-level interrupt events, external pins and pin multiplexing, external memory, system debug, system boot, multimedia subsystem, power management, and system security.

1.1.3 Suggested Reading

This section lists additional reading materials that provide background for the information in this manual, as well as general information about the architecture.

1.1.3.1 General Information

The following documentation provides useful background information about the ARM Cortex-A9 processor.

For information about the ARM Cortex-A9 processor see:

- <http://infocenter.arm.com>

1.1.3.2 Related Documentation

Freescale documentation is available from the sources listed on the back cover of this manual; the document order numbers are included in parentheses for ease in ordering.

For a current list of documentation, refer to <http://www.freescale.com>.

1.1.4 Conventions

This document uses the following notational conventions:

cleared / set

When a bit takes the value zero, it is said to be cleared; when it takes a value of one, it is said to be set.

mnemonics

Instruction mnemonics are shown in lowercase bold

italics

Italics indicate variable command parameters, for example, **bcctrx**

Book titles in text are set in italics

15

An integer in decimal

0x

Prefix to denote hexadecimal number

0b

Prefix to denote binary number. Binary 0 and 1 are written without the prefix.

n'H4000CA00

n-bit Hexadecimal number

BLK_REG_NAME

Register names are all uppercase. The block mnemonic is prepended with an underscore delimiter (_).

BLK_REG[FIELD]

Fields within registers appear in brackets. For example, ESR[RLS] refers to the Receive Last Slot field of the ESAI Status Register.

BLK_REG[*n*]Bit number *n* within register BLK.REG.**BLK_REG[*l:r*]**Register bit ranges. Ranges are indicated by the left-most bit number *l* and the right-most bit number *r* separated by a colon (:). For example, ESR[15:0] refers to the lower half word in the ESAI Status Register.**x, U**

In some contexts, such as signal encodings, an unitalicized x indicates a don't care or uninitialized. The binary value could be 1 or 0.

xAn italicized *x* indicates an alphanumeric variable***n, m***Italicized *n* or *m* represent integer variables**!**

Binary logic operator NOT

&&

Binary logic operator AND

||

Binary logic operator OR

^ or <O+>

Binary logic operator XOR

|

Bit-wise OR. For example, 0b0001 | 0b1000 yields the value 0b1001.

&

Bit-wise AND. For example, 0b0001 & 0b1000 yields the value 0b0000.

{A,B}

Concatenation, where the n -bit value A is prepended to the m -bit value B to form an $(n+m)$ -bit value. For example, {0, REG m [14:0]} yeilds a 16-bit value with 0 in the most significant bit.

- or grey fill

Indicates a reserved bit field in an register. Although these bits can be written to as ones or zeros, they are always read as zeros.

1.1.5 Register Access

1.1.5.1 Register Diagram Field Access Type Legend

The following figure provides the interpretation of the notation used in register diagrams for a number of common field access types.

Figure 1-1. Register Field Conventions

NOTE

For reserved register fields, software should mask off the data in the field after read (software can not rely on the contents of data read from a reserved field) and always write all zeros.

1.1.5.2 Register Macro Usage

A common operation is to update one field without disturbing the contents of the remaining fields in the register. Normally, this requires a read-modify-write (RMW) operation, where the CPU reads the register, modifies the target field, then writes the results back to the register. This is an expensive operation in terms of CPU cycles, because of the initial register read.

To address this issue, some hardware registers are implemented as a group, including registers that can be used to either set, clear, or toggle (SCT) individual bits of the primary register. When writing to an SCT register, all bits set to 1 perform the associated operation on the primary register, while all bits set to 0 are not affected. The SCT registers always read back 0, and should be considered write-only. The SCT registers are not implemented if the primary register is read-only.

With this architecture, it is possible to update one or more fields using only register writes. First, all bits of the target fields are cleared by a write to the associated clear register, then the desired value of the target fields is written to the set register. This sequence of two writes is referred to as a clear-set (CS) operation.

A CS operation does have one potential drawback. Whenever a field is modified, the hardware sees a value of 0 before the final value is written. For most fields, passing through the 0 state is not a problem. Nonetheless, this behavior is something to consider when using a CS operation.

Also, a CS operation is not required for fields that are one bit wide. While the CS operation works in this case, it is more efficient to simply set or clear the target bit (that is, one write instead of two). A simple set or clear operation is also atomic, while a CS operation is not.

Note that not all macros for set, clear, or toggle (SCT) are atomic. For registers that do not provide hardware support for this functionality, these macros are implemented as a sequence of read/modify/write operations. When atomic operation is required, the developer should pay attention to this detail, because unexpected behavior might result if an interrupt occurs in the middle of the critical section comprising the update sequence.

1.1.6 Signal Conventions

_b, _B

When appended to a signal name, indicates that a signal is active-low

NEG_ACTIVE

Overbar also denotes a negative active signal

UPPERCASE

Package pin names, Block I/O signals

lowercase

Lowercase is used to indicate internal signals

1.1.7 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

Acronyms and Abbreviated Terms

| Term | Meaning |
|-------------------------|--|
| AHB | Advanced High-performance Bus |
| ALU | Arithmetic Logic Unit |
| AMBA | Advanced Microcontroller Bus Architecture |
| APB | Advanced Peripheral Bus |
| AXI | Advanced eXtensible Interface |
| BIST | Built-in self test |
| DDR | Double data rate |
| DMA | Direct memory access |
| DPLL | Digital phase-locked loop |
| DRAM | Dynamic random access memory |
| ECC | Error correcting codes |
| EPROM | Erasable programmable read-only memory |
| FIFO | First-in-first-out |
| GPIO | General-purpose I/O |
| GPR | General-purpose register |
| GPS | Global Positioning System |
| GPU | Graphics Processing Unit |
| HAB | High Assurance Boot |
| I2C or I ² C | Inter-integrated circuit |
| IEEE | Institute of Electrical and Electronics Engineers |
| IrDA | Infrared Data Association |
| JTAG | Joint Test Action Group (a serial bus protocol usually used for test purposes) |
| LCD | Liquid Crystal Display |
| LCDIF | Liquid Crystal Display Interface |
| LDO | Low-Dropout |
| LIFO | Last-in-first-out |
| LRU | Least recently used |
| LSB | Least-significant byte |
| LUT | Lookup Table |
| LVDS | Low Voltage Differential Signaling |
| MAC | Medium Access Control |

Table continues on the next page...

| Term | Meaning |
|--------|---|
| MMC | MultiMedia Card |
| MSB | Most-significant byte |
| MT/s | Mega transfers per second |
| OCRAM | On-Chip Random Access Memory |
| PCI | Peripheral Component Interconnect |
| PCIe | PCI enhanced |
| PCMCIA | Personal Computer Memory Card International Association |
| PGC | Power Gating Controller |
| PIC | Programmable interrupt controller |
| POR | Power-on reset |
| PSRAM | Pseudo-Static Random Access Memory |
| QoS | Quality of Service |
| R2D | Radians to Degrees |
| RISC | Reduced instruction set computing |
| ROM | Read-Only Memory |
| RTOS | Real-time operating system |
| Rx | Receive |
| SCU | Snoop Control Unit |
| SD | Secure Digital |
| SDIO | Secure Digital Input/Output |
| SDLC | Synchronous data link control |
| SDMA | Smart DMA |
| SoC | System-On-Chip |
| SPDIF | Sony Phillips Digital Interface |
| SPI | Serial peripheral interface |
| SRAM | Static random access memory |
| TFT | Thin Film Transistor |
| Tx | Transmit |
| UART | Universal asynchronous receiver/transmitter |
| USB | Universal serial bus |
| WLAN | Wireless Local Area Network |
| WXGA | Wide Extended Graphics Array |

1.2 Introduction

This chapter introduces the architecture of the i.MX 6Dual/6Quad Multimedia Applications Processor.

The i.MX 6Dual/6Quad processor represents Freescale Semiconductor's latest achievement in integrated multimedia applications processors.

It is part of a growing family of multimedia-focused products, offering high performance processing optimized for the lowest power consumption.

1.3 Target Applications

The i.MX 6Dual/6Quad applications processor is tailored for use in multimedia-centric smart mobile devices, driver information systems including infotainment and graphical instrument clusters, and portable medical devices.

The architecture's flexibility also allows for use in a wide variety of general embedded applications. The heart of the application chipset, the i.MX 6Dual/6Quad processor provides all of the interfaces necessary for connecting peripherals such as WLAN, Bluetooth™, GPS, camera sensors, and multiple displays.

1.4 Features

The i.MX 6Dual/6Quad Application Processor (AP) is based on the ARM Cortex A9 MPCore™ Platform, which has the following features:

- ARM Cortex A9 MPCore™ Dual or Quad core CPU configurations (with TrustZone)
- Symmetric CPU configuration where each CPU includes:
 - 32 Kbyte L1 Instruction Cache
 - 32 Kbyte L1 Data Cache
 - Private Timer and Watchdog
 - Cortex-A9 NEON MPE (Media Processing Engine) Co-processor.

The ARM Cortex A9 MPCore™ complex includes:

- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- 1 Megabyte unified L2 cache shared by all CPU cores (Dual or Quad)
- Two Master AXI (64-bit) bus interfaces output of L2 cache
- NEON MPE coprocessor
 - SIMD Media Processing Architecture
 - NEON register file with 32x64-bit general-purpose registers
 - NEON Integer execute pipeline (ALU, Shift, MAC)

- NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
- NEON load/store and permute pipeline
- Supports single and double-precision add, subtract, multiply, divide, multiply and accumulate, and square root operations as described in the ARM VFPv3 architecture.
- Provides conversions between 16-bit, 32-bit and 64-bit floating-point formats and ARM integer word formats

The i.MX 6Dual/6Quad processor makes use of dedicated HW accelerators in order to meet the targeted multimedia performance. The use of HW accelerators is a key factor in obtaining high performance at low power consumption numbers, while keeping the CPU core relatively free to perform other tasks.

The i.MX 6Dual/6Quad processor incorporates the following hardware accelerators:

- VPU -Video Processing Unit
- Two IPUv3H -Image Processing Unit (version 3H)
- GPU3Dv4 - 3D/2D Graphics Processing Unit (OpenGL ES 2.0), version 4
- GPU2Dv2 - 2D Graphics Processing Unit (BitBlit).
- GPU VG - OpenVG 1.1 Graphics Processing Unit
- ASRC - Asynchronous Sample Rate Converter

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC- System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features
- CAAM - Cryptographic Acceleration and Assurance Module, incorporating 16KB secure RAM
- SNVS - Secure Non-Volatile Storage, including Secure Real Time Clock
- CSU - Central Security Unit. Configured during boot and by e-fuses, and will determine the security level operation mode as well as the TZ policy
- A-HAB-Advanced High Assurance Boot - HABv4 with the next embedded enhancements: SHA-256, 2048 bit RSA key, version control mechanism, warm boot, CSU and TZ initialization

The memory system consists of the following levels:

- Level 1 Cache - 32KB Instruction, 32KB Data cache per each core.
- Level 2 Cache - Unified instruction and data (1MByte)
- On-Chip Memory
 - Boot ROM, including HAB (96 KB)

Features

- Internal multimedia / shared, fast access RAM (256KByte)
- Secure/non-secure RAM (16 KB)

The chip enables the following interfaces to external devices (some of them are muxed and not available simultaneously):

- Hard Disk Drives
 - SATA II, 3.0 Gbps
- Displays
 - Five interfaces available. Total raw pixel rate of all interfaces is up to 532 Mpixels/sec, 24 bpp (266 Mpixels/sec per each IPU). Up to four interfaces may be active at once.
 - Two Parallel 24-bit display ports - up to 220 Mpixels/sec each (e.g. WUXGA+ @ 60Hz), or dual HD1080 + WXGA @ 60Hz.
 - LVDS serial ports: One port up to 165 Mpixels/sec or Two ports up to 85 MP/sec (e.g. WUXGA+ @ 60Hz) each
 - HDMI 1.4 port
 - MIPI/DSI, 2 lanes @ 1 Gbps
- Camera sensors
 - Up to three interfaces may be active at once
 - Two Parallel Camera ports (up to 20-bit, up to 240MHz peak¹ each).
 - MIPI CSI-2 / Parallel port, supporting from 80 Mbps up to 1 Gbps speed per data lane. The CSI-2 Receiver core can manage one clock lane and up to 4 data lanes. There are 4 lanes in i.MX 6Dual/6Quad.
- Expansion cards
 - Four SD/MMC/SDIO Controllers:
 - Fully compliant with MMC command/response sets and Physical Layer as defined in the Multimedia Card System Specification, v4.2/4.3/4.4/4.41 including high-capacity (size > 2GB) cards HC MMC. HW reset as specified for eMMC cards is supported at ports #3 and #4 only.
 - Fully compliant with SD command/response sets and Physical Layer as defined in the SD Memory Card Specifications, v3.0 including extended-capacity SDHC cards up to 32 GB.
 - Fully compliant with SDIO command/response sets and interrupt/read-wait mode as defined in the SDIO Card Specification, Part E1, v1.10
 - Fully compliant with SD Card Specification, Part A2, SD Host Controller Standard Specification, v2.00
 - Supports:

1. The peak value of 240MHz is based on IPU capability and applies to internal sources such as CSI-2. Using parallel input is subject to IO cell timing capability and board design signal timing constraints. The actual frequency is expected to be lower. Final frequency will be determined by IC characterization.

- 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR104 mode (104MB/s max)
- 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52MHz in both SDR and DDR modes (104MB/s max)
- Instances #1 and #2 are primarily intended to serve as external slots or interfaces to on-board SDIO devices
- Instances #3 and #4 are primarily intended to serve as interfaces to embedded MMC memory or interfaces to on-board SDIO devices
- All ports can work with 1.8V and 3.3V cards. There are two completely independent IO power domains for Ports #1 and #2.
- External memory interfaces
 - 16/32/64-bit DDR3-1066, LV-DDR3-1066 and 1 / 2 LPDDR2-1066 channels
 - 8-bit NAND-Flash, including support for Raw MLC/SLC, 2,4,8KB page size (up to 4x devices), BA-NAND, PBA-NAND, LBA-NAND, OneNAND™ and others. BCH ECC up to 40-bit.
 - 16-bit Nor Flash. All WEIMv2 pins are muxed on other interfaces.
 - 16-bit PSRAM, Cellular RAM.
- USB
 - High Speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB Phy
 - Three USB 2.0 (480 Mbps) hosts:
 - HS host, with integrated HS Phy.
 - Two HS host, with integrated HS-IC USB (High Speed Inter-Chip USB) Phy.
- Low Power modes

The i.MX 6Dual/6Quad integrates advanced power management unit and controllers:

- PMU, including LDO supplies for on-chip resources
- Temperature Sensor for monitoring the die temperature
- Supporting DVFS techniques for low power modes
- Uses SW State Retention, and Power Gating for ARM and MPE
- Support for various levels of system power modes
- Flexible clock gating control scheme
- Expansion PCI Express port (PCIe) v2.0 one lane
 - PCI express (Gen 2.0) dual mode complex supporting Root complex operations and Endpoint operations. x1 PHY configuration.
- Miscellaneous IPs and interfaces:
 - Three SSI's that support I2S/AC97, up to 1.4 Mbps each
 - Enhanced Serial Audio Interface (ESAI), up to 1.4 Mbps each channel
 - Five UART, up to 4.0 Mbps each
 - Providing RS232 interface

- Supporting 9-bit RS485 multidrop mode
- One of the five supports 8-wire (uart1) while the other four support 4-wire. (Due to SoC IOMUX limitation, as all UART IP are identical).
- Five eCSPI (Enhanced CSPI). Using chip selects to support multiple peripherals.
- Three I2C, supports 400 Kbps
- Gigabit Ethernet Controller (IEEE1588 compliant), 1Gbps/10/100 Mbps
- Four Pulse Width Modulators (PWM)
- System JTAG Controller (SJC)
- GPIO with interrupt capabilities
- 8x8 Key Pad Port (KPP)
- Sony Philips Digital Interface (SPDIF), Rx and Tx
- Two Controller Area Network (FlexCAN), 1 Mbps each
- Two Watchdog timers (WDOG)
- Audio MUX (AUDMUX)
- MLB (MediaLB) provides interface to MOST Networks (MOST25 , MOST50 , MOST150) with DTCP cipher accelerator

1.5 Architectural Overview

This section contains i.MX 6Dual/6Quad architectural details.

1.5.1 Block Diagram

A simplified block diagram is provided in the following section.

1.5.1.1 Simplified Block Diagram

A high level block diagram is shown in the figure below. This diagram provides a view of the i.MX 6Dual/6Quad's major sub-systems (processor domains, shared peripherals domain, memories, and so on) and logical connectivity.

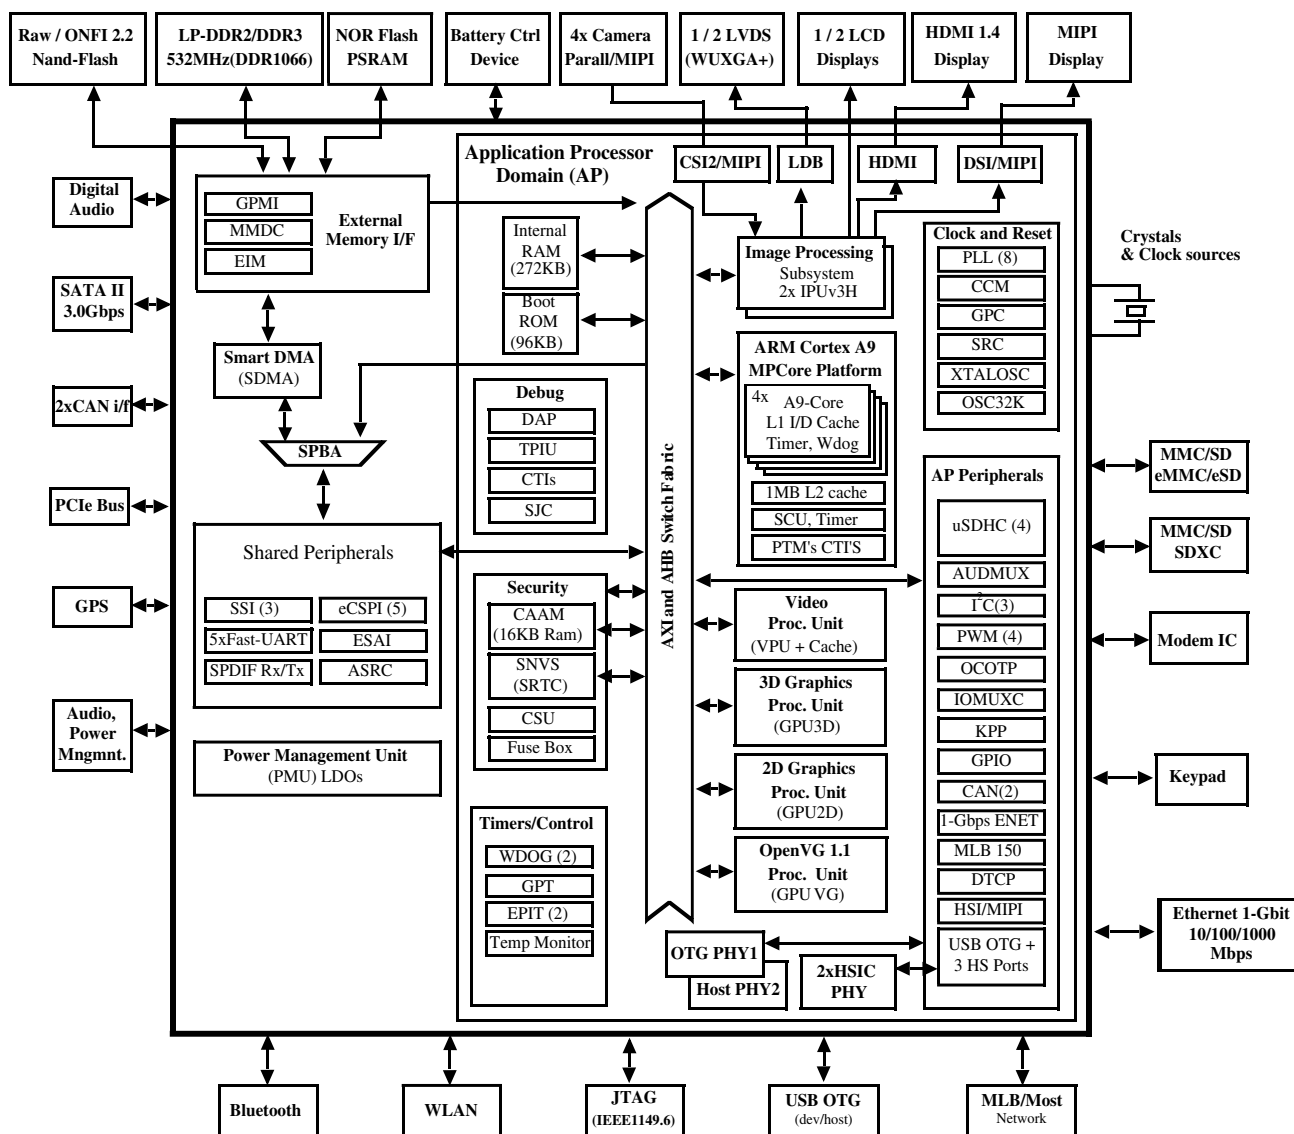

Figure 1-2. Simplified Block Diagram

1.5.2 Architectural Partitioning

Architecture supports processing-intensive tasks in the following ways:

- ARM Cortex A9 MPCore™ Platform is responsible for:
 - Operating System
 - User applications (including control over hardware accelerators and non-accelerated functions)
 - TrustZone applications

- Smart DMA enables data transfer between non-mastering peripherals and external or internal memories
- System Control is supported via:
 - Clock Control Module (CCM)
 - Eight PLLs and two PFDs
 - XTALOSC- 24MHz Crystal oscillator source support
 - OSC32KHz - 32.768Hz Crystal oscillator source support
 - System Reset Controller (SRC)
 - General Power Controller (GPC)
 - Temperature Sensor for monitoring and alarming on high temperature situations.
- Multimedia is supported with:
 - Two independent Image Processing Units-IPUv3H
 - Connectivity to displays and controllers (Parallel, LVDS, MIPI, HDMI), cameras (parallel, MIPI).
 - Display Processing: video/graphics combining, image enhancement
 - Image conversions: resizing, rotation/inversion, color conversion, de-interlacing
 - Synchronization and control capabilities, allowing autonomous operation
 - Video Processing Unit (VPU), supports various decoding/encoding formats in HW, up to 1080p plus SD 30fps decoding (H.264, VC1, RV10, DivX, etc.), and up to 1080p 30fps encoding (H.264, etc.).
 - Graphics Processing Unit (GPU3Dv4) graphics processing compliant with the following:
 - OpenGL ES 1.1 and 2.0 including extensions.
 - OpenVG 1.1
 - Windows Direct3D
 - OpenCL EP
 - Graphics Processing Unit (GPU2Dv2)
 - Vector graphics processing unit (GPUVGv2):
 - Real-time hardware curve tessellation of lines, quadratic and cubic Bezier curves
 - 16x Line Anti-aliasing
 - OpenVG 1.1 support
 - Vector Drawing functions
 - Audio
 - Audio codecs are provided by SW, which runs on ARM core, supporting (but not limited to) MP3, WMA, AAC, HE-AAC and Pro10
 - 3x SSIs
 - ESAI
 - SPDIF Tx/Rx

- Audio Mux
- ASRC (Audio sample rate conversion accelerator)
- Security is supported by:
 - High Assurance Boot (HAB4) System
 - ARM TrustZone (TZ) Trusted Execution environment
 - DDR Memory secure region protection by TrustZone Address Space Controller
 - On-chip RAM (OCRAM) single region TrustZone protection
 - Peripheral access policy control, using Central Security Unit (CSU)
 - One-Time Programmable (OTP) electrical fuse array (Total of 3840-bit e-fuses) via the On-chip electrical fuse controller (OCOTP_CTRL)
 - CAAM and SNVS security architecture, providing:
 - 16KB Secure RAM
 - Secure Real Time Counters
 - Security State Controller
 - Encryption and Hashing functions, Random Number Generator (RNG)
 - Security Violation/Tamper Detection & Reporting
 - System JTAG controller (SJC)
 - Secure Real Time Clock (SRTC)
 - TrustZone Watchdog (TZ WDOG)
- Connectivity peripherals, timers and External Memory Interfaces:
 - Embedded DMAs
 - 3.3V IO voltage for seamless integration
 - Four USB 2.0 ports, including four PHYs: 2x HS-USB (OTG + HOST) and 2x HS-IC USB integrated PHYs
 - Memory, 1066 MT/s per Line, supports LP-DDR2 (2x16, 2x32, 2x32 interleaved mode - x64), DDR3 (x16/x32/x64) and DDR3L (x16/x32/x64)
 - Nand-Flash (MLC up to 40-bit ECC) and NOR Flash memory interface via GPMI Nand-Flash controller
 - Timers: 2xEPIT, GPT and two Watch Dog timers (one of which is used for TZ), in addition to the timers and watchdog timers integrated within the ARM Cortex A9 MPCore™ platform.
 - Miscellaneous connectivity support - SATA, PCIe, FLEXCAN, MLB, MMC/SD, I2C, SPI, UART, PWM and Keypad interface

1.5.3 Endianness Support

i.MX 6Dual/6Quad supports Little Endian mode only.

1.5.4 Memory Interfaces

i.MX 6Dual/6Quad Multi-Port DRAM/DDR controller (MMDC) supports the following memory interfaces:

- LP-DDR2-1066, 1 or 2 channels x32-bit, 532MHz clock.
- DDR3 / LV-DDR3 32/64-bit, 532MHz clock.

NAND Flash controller supports the following:

- x8 NAND Flash bus.
- Configurable page size of 2KB, 4KB, 8KB.
- Configurable spare area per page of up to 512B
- Supports interleaved accesses to up to 8 NAND devices
- Legacy raw SLC, MLC type device
- Supports up to 40-bit ECC by HW BCH ECC accelerator, capable of 200MB/s encode/decode rate.
- ONFI2.2 compliant
 - Timing modes 0-5 for both asynchronous and synchronous I/F. Synchronous clock rate of up to 100MHz with data rate of up to 200MB/s.
- Vendor specific devices: BA-NAND (Micron), PBA-NAND and LBA-NAND (Toshiba), E2-NAND (Hynix), EF-NAND (Samsung), Samsung's "Toggle-mode" NAND (clock rate of up to 66MHz and 80MHz, with data rate of up to 133MB/s and 160MB/s respectively)

NOR Flash, SRAM and PSRAM, 16/8-bit NOR Flash, interface is supported by the EIM block. All EIM pins are muxed on other interfaces.

Chapter 2 Memory Maps

2.1 Memory system overview

This chapter introduces the memory architecture of the i.MX 6Dual/6Quad device.

2.2 ARM platform memory map

The i.MX 6Dual/6Quad memory map has been provided in the following tables. The mapping of the DDR memory address space can be configured by software or hardware fuses, depending on the memory device type (LPDDR2/DDR2/DDR3) and the selected interleave/non-interleaving scheme.

A combined memory map (both 2x32 and x64) is shown in the following table.

Table 2-1. System memory map

| Start address | End address | Size | Description |
|---------------|-------------|---------|---|
| 1000_0000 | FFFF_FFFF | 3840 MB | MMDC - DDR Controller. See DDR mapping to MMDC controller ports |
| 0800_0000 | 0FFF_FFFF | 128 MB | EIM - Memory |

NOTE

User should not address reserved memory regions. Access to reserved memory regions can cause unpredictable behavior.

2.3 DDR mapping to MMDC controller ports

The following table lists the various DDR configuration modes and how each is mapped to the DDR channels.

| Memory Mapping Mode | DDR Memory Map Config[1:0] fuse value | Start Address | End Address | Total Size | MMDC channel / ports |
|---|---------------------------------------|---------------|-------------|------------|--------------------------------------|
| X32 / X64 bit, fixed mapping | '00' | 1000_0000 | FFFF_FFFF | 3840MB | MMDC #0 |
| Dual channel (2x 32-bit), Fixed mapping (LPDDR2) | '01' | 8000_0000 | FFFF_FFFF | 2048MB | MMDC #0 |
| | | 1000_0000 | 7FFF_FFFF | 1792MB | MMDC #1 |
| Dual channel (2x 32-bit), Interleaved mapping (LPDDR2) ¹ | '10' | 1000_0000 | FFFF_FFFF | 3840MB | MMDC #0 , MMDC #1 (interleaved data) |
| Illegal | '11' | | | | |

1. In the 4KB interleaving mode the system bus maps each consecutive 4KB region to a 4KB region in the other MMDC port, such that "even" 4KB spaces are mapped to MMDC0, and "odd" 4KB regions mapped to MMDC1.

2.4 DMA memory map

The Smart DMA memory map can be found in the following table.

Table 2-6. SDMA peripheral memory map

| Peripheral | Base address | Size |
|--------------------------------------|--------------|------|
| Reserved for SDMA internal memory | 0x0000 | 4KB |
| SPDIF | 0x1000 | 4KB |
| eCSPI-1 | 0x2000 | 4KB |
| eCSPI-2 | 0x3000 | 4KB |
| eCSPI-3 | 0x4000 | 4KB |
| eCSPI-4 | 0x5000 | 4KB |
| eCSPI-5 | 0x6000 | 4KB |
| Reserved for SDMA internal registers | 0x7000 | 4KB |
| UART-1 | 0x8000 | 4KB |
| ESAI | 0x9000 | 4KB |
| SSI-1 | 0xA000 | 4KB |
| SSI-2 | 0xB000 | 4KB |
| SSI-3 | 0xC000 | 4KB |
| ASRC | 0xD000 | 4KB |
| Reserved | 0xE000 | 4KB |
| SPBA Registers | 0xF000 | 4KB |

NOTE

User should not address reserved memory regions. Access to reserved memory regions can cause unpredictable behavior.

Chapter 3

Interrupts and DMA Events

3.1 Overview

This chapter discusses the assignments of interrupts from the ARM domain in [AP interrupts](#) and from DMA events in [SDMA event mapping](#)

3.1.1 AP interrupts

The Global Interrupt Controller (GIC) collects up to 128 interrupt requests from all i.MX 6Dual/6Quad sources and provides an interface to each of the CPU cores.

The first 32 interrupts are used for interrupts that are private to the CPUs interface. These interrupts are not included in the table below. All interrupts besides the private CPU are also hooked up to the GPC in the same order.

Each interrupt can be configured as a normal or a secure interrupt. Software force registers and software priority masking are also supported. The following table describes the ARM interrupt sources.

Table 3-1. ARM domain interrupt summary

| IRQ | Interrupt Source | Interrupt Description |
|-----|------------------|---|
| 32 | IOMUXC | General Purpose Register 1 from IOMUXC. Used to notify cores on exception condition while boot. |
| 33 | DAP | Debug Access Port interrupt request. |
| 34 | SDMA | SDMA interrupt request from all channels. |
| 35 | VPU | JPEG codec interrupt request. |
| 36 | SNVS | PMIC power off request. |
| 37 | IPU | IPU error interrupt request. |
| 38 | IPU1 | IPU1 sync interrupt request. |
| 39 | IPU2 | IPU2 error interrupt request. |

Table continues on the next page...

Table 3-1. ARM domain interrupt summary (continued)

| IRQ | Interrupt Source | Interrupt Description |
|-----|------------------|--|
| 40 | IPU2 | IPU2 sync interrupt request. |
| 41 | GPU3D | GPU3D interrupt request. |
| 42 | R2D GPU2D | R2D GPU2D general interrupt request. |
| 43 | V2D GPU2D | V2D GPU2D(OpenVG) general interrupt request. |
| 44 | VPU | VPU interrupt request. |
| 45 | APBH-Bridge-DMA | Logical OR of APBH-Bridge-DMA channels 0-3 completion and error interrupts. |
| 46 | EIM | EIM interrupt request. |
| 47 | BCH | BCH operation complete interrupt. |
| 48 | GPMI | GPMI operation timeout error interrupt. |
| 49 | DTCP | DTCP interrupt request. |
| 50 | VDOA | Logical OR of VDOA interrupt requests. |
| 51 | SNVS | SNVS consolidated interrupt. |
| 52 | SNVS | SNVS security interrupt. |
| 53 | CSU | CSU interrupt request 1. Indicates to the processor that one or more alarm inputs were asserted. |
| 54 | uSDHC1 | uSDHC1 (Enhanced SDHC) interrupt request. |
| 55 | uSDHC2 | uSDHC2 (Enhanced SDHC) interrupt request. |
| 56 | uSDHC3 | uSDHC3 (Enhanced SDHC) interrupt request. |
| 57 | uSDHC4 | uSDHC4 (Enhanced SDHC) interrupt request. |
| 58 | UART1 | UART1 interrupt request. |
| 59 | UART2 | UART2 interrupt request. |
| 60 | UART3 | UART3 interrupt request. |
| 61 | UART4 | UART4 interrupt request. |
| 62 | UART5 | UART5 interrupt request. |
| 63 | eCSPI1 | eCSPI1 interrupt request. |
| 64 | eCSPI2 | eCSPI2 interrupt request. |
| 65 | eCSPI3 | eCSPI3 interrupt request. |
| 66 | eCSPI4 | eCSPI4 interrupt request. |
| 67 | eCSPI5 | eCSPI5 interrupt request. |
| 68 | I2C1 | I2C1 interrupt request. |
| 69 | I2C2 | I2C2 interrupt request. |
| 70 | I2C3 | I2C3 interrupt request. |
| 71 | SATA | SATA interrupt request. |
| 72 | USB | USB Host 1 interrupt request. |
| 73 | USB | USB Host 2 interrupt request. |
| 74 | USB | USB Host 3 interrupt request. |
| 75 | USB | USB OTG interrupt request. |
| 76 | USB_PHY | UTMI0 interrupt request. |
| 77 | USB_PHY | UTMI1 interrupt request. |

Table continues on the next page...

Table 3-1. ARM domain interrupt summary (continued)

| IRQ | Interrupt Source | Interrupt Description |
|-----|---------------------|--|
| 78 | SSI1 | SSI1 interrupt request. |
| 79 | SSI2 | SSI2 interrupt request. |
| 80 | SSI3 | SSI3 interrupt request. |
| 81 | Temperature Monitor | Temperature Sensor (temp. greater than threshold) interrupt request. |
| 82 | ASRC | ASRC interrupt request. |
| 83 | ESAI | ESAI interrupt request. |
| 84 | SPDIF | SPDIF interrupt. |
| 85 | MLB150 | MLB error interrupt request. |
| 86 | PMU | Brown out of 1.1, 2.5 and 3.0 analog regulators occurred. |
| 87 | GPT | Logical OR of GPT rollover interrupt line, input capture 1 & 2 lines, output compare 1, 2 & 3 interrupt lines. |
| 88 | EPIT1 | EPIT1 output compare interrupt. |
| 89 | EPIT2 | EPIT2 output compare interrupt. |
| 90 | GPIO1 | INT7 interrupt request. |
| 91 | GPIO1 | INT6 interrupt request. |
| 92 | GPIO1 | INT5 interrupt request. |
| 93 | GPIO1 | INT4 interrupt request. |
| 94 | GPIO1 | INT3 interrupt request. |
| 95 | GPIO1 | INT2 interrupt request. |
| 96 | GPIO1 | INT1 interrupt request. |
| 97 | GPIO1 | INT0 interrupt request. |
| 98 | GPIO1 | Combined interrupt indication for GPIO1 signals 0 - 15. |
| 99 | GPIO1 | Combined interrupt indication for GPIO1 signals 16 - 31. |
| 100 | GPIO2 | Combined interrupt indication for GPIO2 signals 0 - 15. |
| 101 | GPIO2 | Combined interrupt indication for GPIO2 signals 16 - 31. |
| 102 | GPIO3 | Combined interrupt indication for GPIO3 signals 0 - 15. |
| 103 | GPIO3 | Combined interrupt indication for GPIO3 signals 16 - 31. |
| 104 | GPIO4 | Combined interrupt indication for GPIO4 signals 0 - 15. |
| 105 | GPIO4 | Combined interrupt indication for GPIO4 signals 16 - 31. |
| 106 | GPIO5 | Combined interrupt indication for GPIO5 signals 0 - 15. |
| 107 | GPIO5 | Combined interrupt indication for GPIO5 signals 16 - 31. |
| 108 | GPIO6 | Combined interrupt indication for GPIO6 signals 0 - 15. |
| 109 | GPIO6 | Combined interrupt indication for GPIO6 signals 16 - 31. |
| 110 | GPIO7 | Combined interrupt indication for GPIO7 signals 0 - 15. |
| 111 | GPIO7 | Combined interrupt indication for GPIO7 signals 16 - 31. |
| 112 | WDOG1 | WDOG1 timer reset interrupt request. |
| 113 | WDOG2 | WDOG2 timer reset interrupt request. |
| 114 | KPP | Key Pad interrupt request. |

Table continues on the next page...

Table 3-1. ARM domain interrupt summary (continued)

| IRQ | Interrupt Source | Interrupt Description |
|-----|------------------|--|
| 115 | PWM1 | Cumulative interrupt line for PWM1. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts. |
| 116 | PWM2 | Cumulative interrupt line for PWM2. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts. |
| 117 | PWM3 | Cumulative interrupt line for PWM3. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts. |
| 118 | PWM4 | Cumulative interrupt line for PWM4. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts. |
| 119 | CCM | CCM interrupt request 1. |
| 120 | CCM | CCM interrupt request 2. |
| 121 | GPC | GPC interrupt request 1. |
| 122 | Reserved | Reserved |
| 123 | SRC | SRC interrupt request. |
| 124 | CPU | L2 interrupt request. |
| 125 | CPU | Parity Check error interrupt request. |
| 126 | CPU | Performance Unit interrupt. |
| 127 | CPU | CTI trigger outputs interrupt. |
| 128 | SRC | Combined CPU wdog interrupts (4x) out of SRC. |
| 129 | Reserved | Reserved. |
| 130 | Reserved | Reserved |
| 131 | Reserved | Reserved |
| 132 | MIPI_CSI | CSI interrupt request 1. |
| 133 | MIPI_CSI | CSI interrupt request 2. |
| 134 | MIPI_DSI | DSI interrupt request. |
| 135 | MIPI_HSI | HSI interrupt request. |
| 136 | SJC | SJC interrupt from General Purpose register. |
| 137 | CAAM | CAAM job ring 0 interrupt. |
| 138 | CAAM | CAAM job ring 1 interrupt. |
| 139 | Reserved | Reserved |
| 140 | ASC1 | ASC1 interrupt request. |
| 141 | ASC2 | ASC2 interrupt request. |
| 142 | FLEXCAN1 | FLEXCAN1 combined interrupt. Logical OR of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein. |
| 143 | FLEXCAN2 | FLEXCAN2 combined interrupt. Logical OR of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein. |
| 144 | Reserved | Reserved |
| 145 | Reserved | Reserved |
| 146 | Reserved | Reserved |
| 147 | HDMI | HDMI master interrupt request. |
| 148 | HDMI | HDMI CEC engine dedicated interrupt signal raised by a wake-up event. |

Table continues on the next page...

Table 3-1. ARM domain interrupt summary (continued)

| IRQ | Interrupt Source | Interrupt Description |
|-----|------------------|--|
| 149 | MLB150 | Channels [31:0] interrupt requests. Channels [63:32] interrupt requests are available on IRQ #158, unless the MLB150_ACTL[SMX] bit is set, in which case those channels are muxed into this IRQ. |
| 150 | ENET | MAC 0 IRQ, Logical OR of: MAC 0 Periodic Timer Overflow MAC 0 Time Stamp Available MAC 0 Time Stamp Available MAC 0 Time Stamp Available MAC 0 Payload Receive Error MAC 0 Transmit FIFO Underrun MAC 0 Collision Retry Limit MAC 0 Late Collision MAC 0 Ethernet Bus Error MAC 0 MII Data Transfer Done MAC 0 Receive Buffer Done MAC 0 Receive Frame Done MAC 0 Transmit Buffer Done MAC 0 Transmit Frame Done MAC 0 Graceful Stop MAC 0 Babbling Transmit Error MAC 0 Babbling Receive Error MAC 0 Wakeup Request [synchronous] |
| 151 | ENET | MAC 0 1588 Timer interrupt [synchronous] request. |
| 152 | PCIE | PCIE interrupt request 1 (intd/msi_ctrl_int). |
| 153 | PCIE | PCIE interrupt request 2 (intc). |
| 154 | PCIE | PCIE interrupt request 3 (intb). |
| 155 | PCIE | PCIE interrupt request 4 (inta). |
| 156 | DCIC1 | Logical OR of DCIC1 interrupt requests. |
| 157 | DCIC2 | Logical OR of DCIC2 interrupt requests. |
| 158 | MLB150 | Logical OR of channel[63:32] interrupt requests. |
| 159 | PMU | Brown out of core, gpu, and soc digital regulators occurred. |

3.2 SDMA event mapping

The following table shows the DMA request signals for peripherals in i.MX 6Dual/6Quad.

Table 3-2. SDMA event mapping

| Event Number | DMA Source | Description |
|--------------|------------------------|--|
| 0 | VPU | VPU DMA request |
| 1 | IPU2 | IPU2 DMA event. |
| 2 | IPU1 / HDMI audio done | IPU1 DMA Event; Muxed with HDMI audio done event, controlled by GPR0[0], IPU1 event - default. |
| 3 | eCSPI1 / I2C3 | eCSPI1 Rx request; Muxed with I2C3 controlled by IOMUXC register GPR0[1]. |
| 4 | eCSPI1 / I2C2 | eCSPI1 Tx request; Muxed with I2C2 controlled by IOMUXC register GPR0[2]. |
| 5 | eCSPI2 / I2C1 | eCSPI2 Rx request; Muxed with I2C1 controlled by IOMUXC register GPR0[3]. |
| 6 | eCSPI2 | eCSPI2 Tx request |
| 7 | eCSPI3 | eCSPI3 Rx request |
| 8 | eCSPI3 | eCSPI3 Tx request |
| 9 | eCSPI4 / EPIT2 | eCSPI4 Rx request; Muxed with EPIT2 DMA request controlled by IOMUXC register GPR0[5]. |
| 10 | eCSPI4 / I2C1 | eCSPI4 Tx request; Muxed with I2C1 controlled by IOMUXC register GPR0[4]. |
| 11 | eCSPI5 | eCSPI5 Rx request |
| 12 | eCSPI5 | eCSPI5 Tx request |
| 13 | GPT | GPT counter event |
| 14 | SPDIF / IOMUX | SPDIFRX DMA request; Muxed with external DMA pad #2 controlled by IOMUXC register GPR0[7]. |
| 15 | SPDIF | SPDIF TX DMA request |
| 16 | EPIT1 | EPIT1 request. |
| 17 | ASRC | ASRC dma1 request (Pair A input Request) |
| 18 | ASRC | ASRC dma2 request (Pair B input Request) |
| 19 | ASRC | ASRC dma3 request (Pair C input Request) |
| 20 | ASRC | ASRC dma4 request (Pair A output Request) |
| 21 | ASRC | ASRC dma5 request (Pair B output Request) |
| 22 | ASRC | ASRC dma6 request (Pair C output Request) |

Table 3-2. SDMA event mapping (continued)

| Event Number | DMA Source | Description |
|--------------|------------|-----------------------------|
| 32 | UART4 | UART4 Tx FIFO |
| 33 | UART5 | UART5 Rx FIFO |
| 34 | UART5 | UART5 Tx FIFO |
| 35 | SSI1 | SSI1 receive 1 DMA request |
| 36 | SSI1 | SSI1 transmit 1 DMA request |
| 37 | SSI1 | SSI1 receive 0 DMA request |
| 38 | SSI1 | SSI1 transmit 0 DMA request |
| 39 | SSI2 | SSI2 receive 1 DMA request |
| 40 | SSI2 | SSI2 transmit 1 DMA request |
| 41 | SSI2 | SSI2 receive 0 DMA request |
| 42 | SSI2 | SSI2 transmit 0 DMA request |
| 43 | SSI3 | SSI3 receive 1 DMA request |
| 44 | SSI3 | SSI3 transmit 1 DMA request |
| 45 | SSI3 | SSI3 receive 0 DMA request |
| 46 | SSI3 | SSI3 transmit 0 DMA request |
| 47 | Reserved | Reserved |

As shown in the table, some of the events are an output of a mux of two signals or triggers. The select of this mux is controlled by the general purpose registers in IOMUXC.

Chapter 4

External Signals and Pin Multiplexing

4.1 Overview

The i.MX 6Dual/6Quad contains a limited number of pins, most of which have multiple signal options. These signal to pin and pin to signal options are selected by the input-output multiplexer called IOMUX. The IOMUX is also used to configure other pin characteristics, such as voltage level, drive strength, and hysteresis.

[Pin Assignments](#) lists the pad names of the chip, the various signals that can be assigned to each of the pads, and the default settings for each pad. [Muxing Options](#) lists the external signals grouped by module instance, the muxing options for each signal, and the registers used to route the signal to the chosen pad.

4.1.1 Pin Assignments

Table 4-1. Pin Assignments

| Pad Name | Mode | Signal | Pad Settings | Pad/Group Registers |
|------------|------|----------------|--------------|---------------------|
| BOOT_MODE0 | | SRC_BOOT_MODE0 | | |
| BOOT_MODE1 | | SRC_BOOT_MODE1 | | |
| CLK1_N | | XTALOSC_CLK1_N | | |
| CLK1_P | | XTALOSC_CLK1_P | | |
| CLK2_N | | XTALOSC_CLK2_N | | |
| CLK2_P | | XTALOSC_CLK2_P | | |

Chapter 5

Fusemap

5.1 Fusemap

This section details the various modes and selection of the required boot devices. A separate map is given for each and every boot device.

The device select is specified by BOOT_CFG1[7:3] fuses listed in [Table 5-1](#).

Table 5-1. Boot Device Select

| Boot Device | BOOT_CFG1[7] | BOOT_CFG1[6] | BOOT_CFG1[5] | BOOT_CFG1[4] | BOOT_CFG1[3] |
|--|--------------|--------------|--------------|--------------|--|
| EIM (Table 5-4) | 0 | 0 | 0 | 0 | Memory Type: 0 - NOR Flash 1 - OneNAND |
| SATA (Table 5-5) | 0 | 0 | 1 | 0 | X |
| Serial ROM (Table 5-6) | 0 | 0 | 1 | 1 | X |
| SD/eSD (Table 5-7) | 0 | 1 | 0 | X | X |
| MMC/eMMC (Table 5-8) | 0 | 1 | 1 | X | X |
| NAND Flash (Table 5-9) | 1 | X | X | X | X |

NOTE

Fuses marked as “Reserved” are reserved for Freescale internal (and future) use only. Customers should not attempt to burn these, as the IC behavior may be unpredictable. The reserved fuses can be read as either ‘0’ or ‘1’.

Table 5-2. Lock Fuses

| Addr | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

5.2 Fusemap Description Table

This section covers the fusemap descriptions of the chip.

Table 5-10. Fusemap Descriptions

| Fuse Address | Fuses Name | Number of Fuses | Fuses Function | Settings | Locked by |
|--------------|---------------|-----------------|--|--|-----------|
| 0x400[1:0] | TESTER_LOCK | 2 | Provides Locking of various fuse bits. | 00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP | N/A |
| 0x400[3:2] | BOOT_CFG_LOCK | 2 | Perform lock on BOOT related fuses. | 00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP | N/A |
| 0x400[5:4] | MEM_TRIM_LOCK | 2 | Trimming fuses. Burned on the tester or by customer before the final product shipment. | 00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded. 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP | N/A |

Table continues on the next page...

Table 5-10. Fusemap Descriptions (continued)

| Fuse Address | Fuses Name | Number of Fuses | Fuses Function | Settings | Locked by |
|--------------|-----------------------------------|-----------------|---|--|-------------|
| 0x400[6] | SJC_RESP_LOCK | 1 | Lock bit for JTAG response fuses. (SJC_RESP) | 00 - Unlock 1 - Read Protect + Write Protect + Override Protect and Program protect lock | N/A |
| 0x400[9:8] | MAC_ADDR_LOCK | 2 | Lock MAC_ADDR fuses. | 00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded. 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP | N/A |
| 0x400[11:10] | GP1_LOCK | 2 | Lock for General Purpose fuse register #1 (GP1) | 00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded. 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP | N/A |
| 0x400[13:12] | GP2_LOCK | 2 | Lock for General Purpose fuse register #2 (GP2) | 00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded. 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP | N/A |
| 0x400[14] | SRK_LOCK | 1 | Locking SRK_HASH[255:0] | 0 - Unlock 1 - Write Protect + Override Protect | N/A |
| 0x400[19:18] | ANALOG_LOCK | 2 | Lock bit for various fuses (Addresses: 0x4D0-0x4F0) | 00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded. 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP | N/A |
| 0x400[22] | MISC_CONF_LOCK | 1 | Locking of MISC_CONFIG fuses (address 0x6D0) | 0 - Unlock 1 - WP + OP of MISC_CONF | N/A |
| 0x410[31:0] | SJC_CHALL[31:0] / UNIQUE_ID[31:0] | 32 | Device Unique ID, also be used for SJC Challenge phrase. (bits 31-0) | Random, by test program. | TESTER_LOCK |
| 0x420[31:0] | SJC_CHALL/ UNIQUE_ID[42:32] | 32 | Device Unique ID, also be used for SJC Challenge phrase. (bits 63-32) | Random, by test program. | TESTER_LOCK |

Table continues on the next page...

Table 5-10. Fusemap Descriptions (continued)

| Fuse Address | Fuses Name | Number of Fuses | Fuses Function | Settings | Locked by |
|--------------|--------------------|-----------------|--|---|---------------|
| 0x430[19:16] | SI_REV[3:0] | 4 | Silicon revision number | 0 - Revision 1.0, 1.1, 1.2 1 - Revision 1.2.2 | TESTER_LOCK |
| 0x430[21:20] | NUM_CORES | 2 | Indicates the type of device : 2x cores or 4x cores. | 00 - 4x Cores. 01 - Reserved 10 - 2x Cores 11 - Reserved | TESTER_LOCK |
| 0x430[24] | SATA_RST_SRC | 1 | Controls mux to select 'hereset' to SATA, from either SATA reset controller, or SRC module. | SATA_RST_SRC 0 - Origin SATA reset controller 1 - SRC reset | TESTER_LOCK |
| 0x440[17:16] | SPEED_GRADING[1:0] | 2 | IC core speed | Reflects part speed grading: 00 = 800 MHz 01 = 850 MHz 10 = 1.0 GHz 11 = Reserved | TESTER_LOCK |
| 0x450[7:0] | BOOT_CFG1 | 8 | BOOT configuration register #1, Usage varies, depending on selected boot device. | See Table 5-1 for details. | BOOT_CFG_LOCK |
| 0x450[15:8] | BOOT_CFG2 | 8 | BOOT configuration register #2, Usage varies, depending on selected boot device. | Refer to the respective boot fusemap tables for details. | BOOT_CFG_LOCK |
| 0x450[23:16] | BOOT_CFG3 | 8 | BOOT configuration register #3 | Refer to the respective boot fusemap tables for details. | BOOT_CFG_LOCK |
| 0x450[31:24] | BOOT_CFG4 | 8 | BOOT configuration register #4 | Refer to the respective boot fusemap tables for details. | BOOT_CFG_LOCK |
| 0x460[1] | SEC_CONFIG[1] | 1 | Select polarity of GPIO pin used for LPB indication. | Out of Factory state: 0 - Open - allows any code to be flashed and executed, even if it has no valid signature. 1 - Closed (Security On) | BOOT_CFG_LOCK |
| 0x460[3] | DIR_BT_DIS | 1 | Direct External Memory Boot Disable | 0 - Direct boot from external memory is allowed 1 - Direct boot from external memory is not allowed | BOOT_CFG_LOCK |

Table continues on the next page...

Table 5-10. Fusemap Descriptions (continued)

| Fuse Address | Fuses Name | Number of Fuses | Fuses Function | Settings | Locked by |
|--------------|------------------|-----------------|---|---|----------------|
| 0x460[4] | BT_FUSE_SEL | 1 | Determines, whether using fuses for boot configuration, or GPIO /Serial loader. | If boot_mode="00" (Development) 0=Boot mode configuration is taken from GPIOs 1 - Boot mode configuration is taken from fuses If boot_mode="10" (Production) 1- Boot mode configuration is taken from fuses | BOOT_CFG_LO CK |
| 0x460[15:8] | DDR3_CONFIG[7:0] | 8 | TBD (DDR3 config options) | | BOOT_CFG_LO CK |
| 0x460[20] | SJC_DISABLE | 1 | Disable/Enable the Secure JTAG Controller module. This fuse is used to create highest JTAG security level, where JTAG is totally blocked. | 0 - Secure JTAG Controller is enabled 1 - Secure JTAG Controller is disabled | BOOT_CFG_LO CK |
| 0x460[21] | WDOG_ENABLE | 1 | Watchdog Enable | Used to specify whether to enable / not watchdog at boot. 0 - Watch-Dog is disabled 1 - Watch-Dog is enabled | BOOT_CFG_LO CK |
| 0x460[23:22] | JTAG_SMODE[1:0] | 2 | JTAG Security Mode. Controls the security mode of the JTAG debug interface | 00 - JTAG enable mode 01 - Secure JTAG mode 11 - No debug mode | BOOT_CFG_LO CK |
| 0x460[26] | KTE | 1 | Kill Trace Enable. Enables tracing capability on ETM, and other modules. | 0 - Bus tracing is allowed 1 - Bus tracing is allowed in case security state as defined by Secure JTAG allows it (for example, JTAG_ENABLE or NO_DEBUG) | BOOT_CFG_LO CK |
| 0x460[27] | JTAG_HEO | 1 | JTAG HAB Enable Override. Disallows HAB JTAG enabling. The HAB may normally enable JTAG debugging by means of the HAB_JDE-bit in the OCOTP SCS register. The JTAG_HEO-bit can override this behavior. | 0 - HAB may enable JTAG debug access 1 - HAB JTAG enable is overridden (HAB may not enable JTAG debug access) | BOOT_CFG_LO CK |

Table continues on the next page...

Table 5-10. Fusemap Descriptions (continued)

| Fuse Address | Fuses Name | Number of Fuses | Fuses Function | Settings | Locked by |
|--------------|--------------------------|-----------------|--|--|---------------|
| 0x460[28] | TZASC_ENABLE | 1 | TZASC1,2 enable fuse. | 0 - TZASC1, 2 modules left in disable and bypass state. 1 - TZASC1, 2 modules, associated clocks and muxing are enabled by Boot ROM code. | BOOT_CFG_LOCK |
| 0x460[29] | SDMMC_HYS_EN | 1 | Override HYS bit for SD/MMC pads | 0 - Override HYS bit for SD/MMC pads disabled. 1 - Once the fuse blown, the [HYS] bit of IOMUXC_SW_PAD_CTL_PAD_SDx_CLK, IOMUXC_SW_PAD_CTL_PAD_SDx_CMD, IOMUXC_SW_PAD_CTL_PAD_SDx_DAT0-n will be set. | BOOT_CFG_LOCK |
| 0x460[30] | eMMC_RESET_EN | 1 | eMMC 4.4 - RESET TO PRE-IDLE STATE | 0 - The CMD0 with argument 0xf0f0f0 will not be sent to put the eMMC card into pre-IDLE state. 1 - The CMD0 with argument 0xf0f0f0 will be sent to put the eMMC card into pre-IDLE state so that eMMC card's fast boot can work properly. | BOOT_CFG_LOCK |
| 0x470[7:0] | NAND_READ_CMD_CODE1[7:0] | 8 | NAND_READ_CMD_CODE 1 | First command word to be used for Nand read. | BOOT_CFG_LOCK |
| 0x470[15:8] | NAND_READ_CMD_CODE2[7:0] | 8 | NAND_READ_CMD_CODE 2 | Second command word to be used for Nand read. | BOOT_CFG_LOCK |
| 0x470[20] | BT_LPB_POLARITY | 1 | Define GPIO3 polarity, for determining LPB boot mode. | 0 - Active High 1 - Active Low | BOOT_CFG_LOCK |
| 0x470[22:21] | LPB_BOOT | 2 | Defined the LowPower Boot options | (Core / DDR- Bus) 00 - LPB Disable 01 - 1 GPIO (default freq) 01 - Div by2 11 - Div by 4 | BOOT_CFG_LOCK |
| 0x470[30:24] | MMC_DLL_DLY[6:0] | 7 | eMMC 4.4/4.41 delay line default value (set by boot rom), used in conjunction with "DLL Override" = 1 (BOOT_CFG3[3]) | Delay value required by USDHC for eMMC 4.4/4.41 to work | BOOT_CFG_LOCK |
| 0x4D0[31] | Power-Gate cores 2,3 | 1 | | 0 - All quad-core devices: 4 cores powered on. 1 - All dual-core devices: cores 2 and 3 power-gated. | ANALOG_LOCK |

Table continues on the next page...

Table 5-10. Fusemap Descriptions (continued)

| Fuse Address | Fuses Name | Number of Fuses | Fuses Function | Settings | Locked by |
|--------------|-----------------|-----------------|--|--|--|
| 0x4F0[15:0] | USB_VID[31:0] | 16 | USB VID value,(to be used by USB software driver). | | ANALOG_LOCK |
| 0x4F0[31:16] | USB_PID[31:0] | 16 | USB PID value (to be used by USB software driver). | | ANALOG_LOCK |
| 0x580-0x5F0 | SRK_HASH[255:0] | 256 | SRK key | 0x580-SRK0 0x590-SRK1 0x5F0-SRK2 0x5F0-SRK3 0x5F0-SRK4 0x5F0-SRK5 0x5F0-SRK6 0x5F0-SRK7 | SRK_LOCK |
| 0x600[31:0] | SJC_RESP[31:0] | 32 | Response reference value for the secure JTAG controller | Customer / OEM use. | SJC_RESP_LOCK (locks also for read and explicit sense) |
| 0x610[23:0] | SJC_RESP[55:32] | 24 | Response reference value for the secure JTAG controller | Customer / OEM use. | SJC_RESP_LOCK (locks also for read and explicit sense) |
| 0x620[31:0] | MAC_ADDR[31:0] | 32 | Reserved for customers/ software | Customer / OEM use. | MAC_ADDR_LOCK |
| 0x630[15:0] | MAC_ADDR[47:32] | 16 | Reserved for customers/ software | Customer / OEM use. | MAC_ADDR_LOCK |
| 0x660[31:0] | GP1[31:0] | 32 | General Purpose fuse register #1 | | GP1_LOCK |
| 0x670[31:0] | GP2[31:0] | 32 | General Purpose fuse register #2 | | GP2_LOCK |
| 0x6D0[5:0] | PAD_SETTINGS | 6 | Used with conjunction of MMC/SD/Nand "Override Pad Settings" fuse value, as follows: 0 - Use IO default settings for boot device IO pads 1 - Use "Override" value, as set by this register | IO pads settings of selected boot interface, are override with this fuses, as follow: [0] - Slew Rate [3:1] Drive Strength [5:4] - Speed Settings. Refer to IO PAD chapter for "Settings" fields value | MISC_CONF_LOCK |
| 0x6E0[0] | FIELD_RETURN | 1 | Configure device for field return testing. Fuse burning requires CSF command. | 0 - Device is in functional / secure mode. 1 - Device is open for 'field-return' testing | FIELD_RETURN_LOCK |

Chapter 6

External Memory Controllers

6.1 Overview

This chip has the following external memory interfaces and controllers:

- Multi-mode DDR controller (MMDC)
- Raw NAND Flash controller, consisting of GPMI2, BCH40, and APBH_DMA components
- EIM-PSRAM/NOR Flash controller

6.2 Multi-mode DDR controller (MMDC) overview and feature summary

The MMDC module is a DDR controller that can support several types of DDR memories and two channel x32 and x64 memory widths.

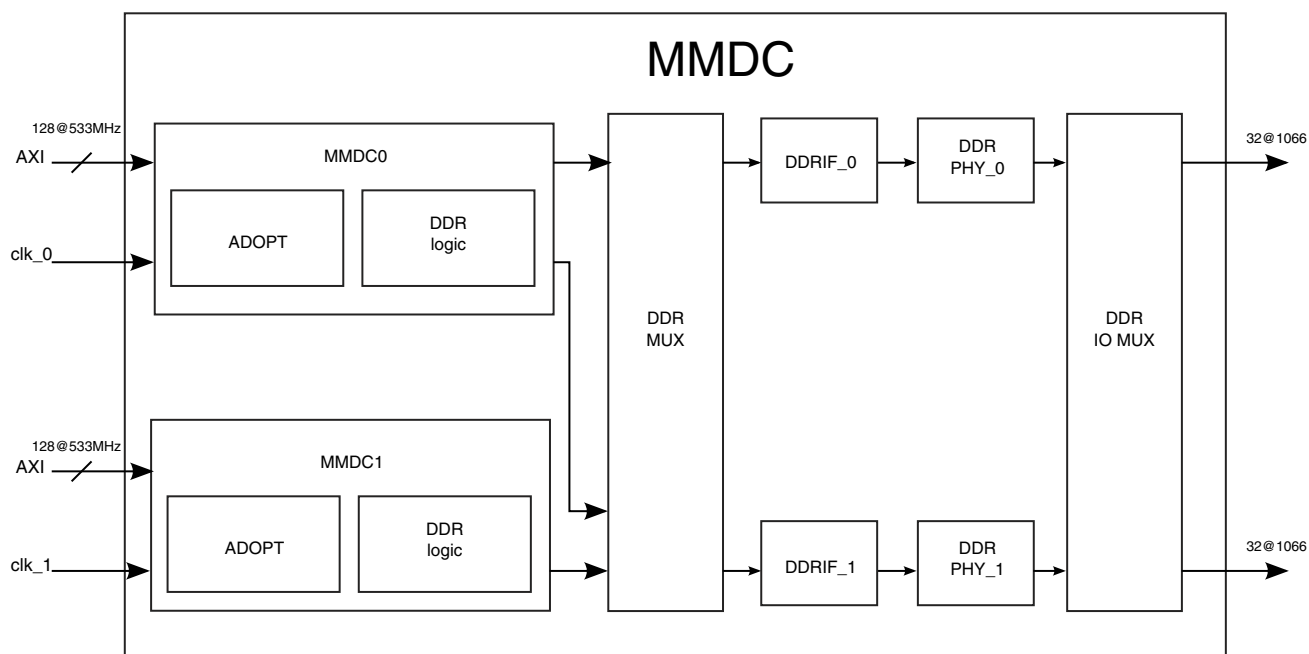

Figure 6-1. MMDC block diagram

Table 6-1. MMDC feature summary

| Feature | Description |
|---------------------|---|
| Supported standards | <ul style="list-style-type: none"> • LV-DDR3, DDR3 x16, x32, x64 (includes SODIMM) • LPDDR2 2ch x32, in either split map or interleaving mode • LPDDR2 1ch x32 |
| DDR interface | <ul style="list-style-type: none"> • x16, x32, x64 data bus width • Density of 256 Mbytes-8 Gbytes <ul style="list-style-type: none"> • Column size of 8-12 bits • Row size of 11-16 bits • 2 CS per channel, with a separate CS allocation for LPDDR2-DRAM) • Up to 4 Gbyte address space and configurable address space per CS. For LPDDR2 2ch x32 up to 2 Gbytes per channel • Interleaved accesses of LPDDR2-DRAM towards the same DDR channel. This is supported only when using the same clock frequency for LPDDR2-DRAM • Supports burst length of 8 (aligned) for DDR3 and burst lengths of 4 for LPDDR2 |

Table continues on the next page...

Table 6-1. MMDC feature summary (continued)

| Feature | Description |
|---------------------------------|--|
| DDR performance | <ul style="list-style-type: none"> • DDR3 and LPDDR2 support up to 1066MT/s transfer rate • Supports Real-Time priority by means of QoS sideband priority signals from the chip to enable different priority levels in the re-ordering mechanism • Page hit/page miss optimizations • Consecutive read/write access optimizations • Supports deep read and write requests queues to enable bank prediction • Drives back the critical word in a read transaction as soon as it is received by the DDR device (doesn't wait until the whole data phase has been completed) • Can track open memory pages • Supports bank interleaving • Special optimization for non-aligned wrap accesses in burst length 8 |
| AXI interface | <ul style="list-style-type: none"> • AXI bus compliant with glueless interface to PL301 AXI network interconnect • Supports bus transfers of 8,16,32, 64 and 128 bits (single accesses and bursts) |
| DDR calibration and delay-lines | <ul style="list-style-type: none"> • All calibrations can be done automatically by hardware or manually by software • ZQ calibration for external DDR device (in DDR3 through the ZQ calibration command and in LPDDR2 through the MRW command). <ul style="list-style-type: none"> • Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh). • Can be handled manually at ZQ INIT. |
| DDR general | <ul style="list-style-type: none"> • Configurable timing parameters • Configurable refresh scheme • Supports dynamic voltage, frequency change and low power mode entry through hardware negotiation with the system (req/ack handshake) • Supports automatic self-refresh and power down entry and exit • Supports fast and slow precharge power down in DDR3 • Supports various ODT control schemes. <ul style="list-style-type: none"> • Assertion/Deassertion of ODT control per read or write accesses and for active or passive CS • Supports MRW and MRR commands for LPDDR2. • Software control for moving to derated timing parameters and derated refresh rate according to temperature variation. • Supports various debug and profiling modes |

6.3 Raw NAND Flash controller overview

The Raw NAND Flash controller consists of three components: BCH, GPMI, and APBH_DMA

- BCH is a 40-bit error correction hardware engine with an AXI bus master and a private connection to GPMI.
- GPMI is the NAND controller pin interface.
- APBH_DMA is the DMA engine that drives the GPMI module.

The following figure shows the modules' connectivity.

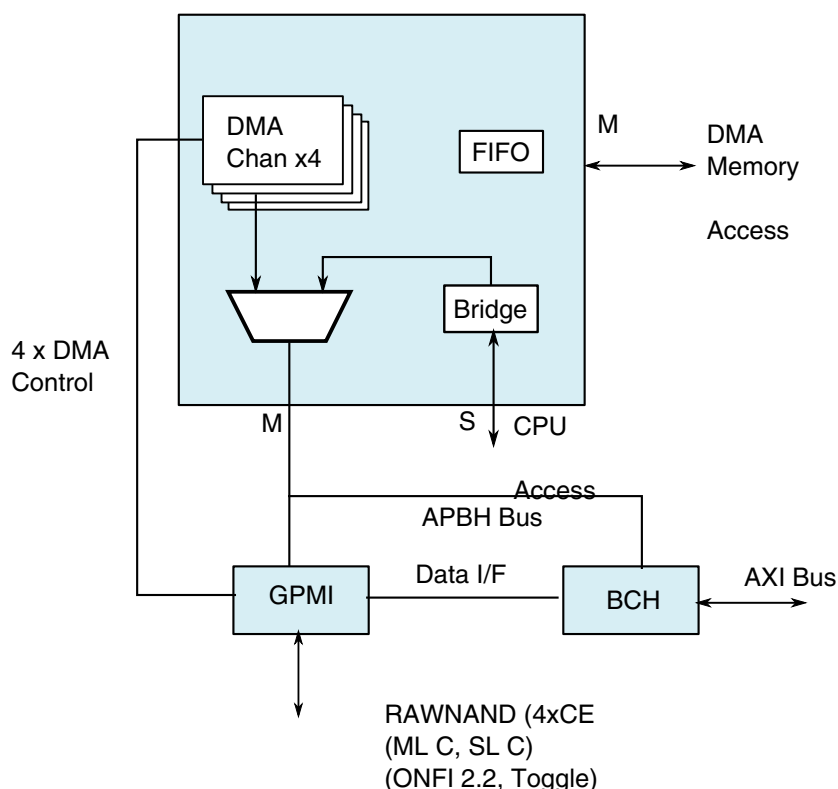

Figure 6-2. Raw NAND Flash controller sub-system

6.3.1 NAND interface features

- ONFI2.2 compliant
 - Timing modes 0-5 for both asynchronous and synchronous interface
 - Synchronous clock rate of up to 100 MHz with data rate of up to 200 MB/s
- Support for ganged ready/busy inputs
 - Support allows the use of a single package pin for all ready busy/busy input signals.
 - In ganged mode (selectable by a programmable mode bit), GPMI expects that all NAND r/b pins are hard wired to the GPMI RDY_BUSY0.
- Up to 4 NAND devices supported by 4 chip-selects and 1 ganged ready/busy.
- Legacy raw SLC, MLC type device
- BA-NAND (Micron)
- PBA-NAND and LBA-NAND (Toshiba)
- E2-NAND (Hynix)
- EF-NAND (Samsung)

- Samsung's "Toggle-mode" NAND (clock rate of up to 66 Mhz and 80 Mhz, with data rate of up to 133 MB/s and 160 MB/s respectively).
- Configurable page size of 2 Kbytes, 4 Kbytes, or 8 Kbytes.
- Configurable spare area per page of up to 512 bytes.
- Support for non-identical NAND devices not required

6.3.2 NAND control features

The NAND control supports interleaved accesses to as many as four NAND devices while hiding the busy period of each devices. However, fully-independent interleaving cannot be supported in ganged ready/busy mode because that suggests fully independent DMA channel operation on multiple paralleled-accessed chip-enables.

It also features:

- Delay line for adjusting the latching edge in case the frequency is relatively high while the delay is big
- Support for monitoring the external ready/busy signal and read status command polling to compare R/B bit.

6.3.3 Internal interface features

- AXI Master interface can access the system's memory space.
- APBH slave port for register configuration through the APBH bridge DMA.

6.3.4 APBH-DMA overview

APBH-DMA provides an APB peripheral bus system for GPMI and BCH. APBH-DMA uses a single GPMI interface to support as many as four DMA channels for four NAND devices (4 chip-enables) in interleaved mode.

6.3.5 ECC-BCH features

BCH supports:

- A data rate of up to 200 Mbytes/s
- 2 Kbyte codeword (1 Kbyte data + parity)

- Galois Field polynomial GF(2¹⁴)
- Up to 40-bit ECC for 1 Kbyte of data. (2,4,6,8,10,12,14,16, 18,20,22,24,26,28,30,32,34,36,38,40 configurable)
- 1 Kbyte codeword (1/2 Kbyte data + parity)
 - Galois Field polynomial GF(2¹³)
 - Up to 40-bit ECC for 1/2 Kbyte of data (2,4,6,8,10,12,14,16, 18,20,22,24,26,28,30,32,34,36,38,40 configurable)

6.4 EIM-PSRAM/NOR Flash controller overview

EIM, which is an external interface module, handles the interface to devices that are external to the chip, including the generation of chip selects, clocks, and control for external peripherals and memory.

It provides asynchronous and synchronous access to devices with an SRAM-like interface.

6.4.1 EIM features

- Up to four (software configurable) chip selects for external devices
 - Flexible address decoding; each chip select memory space is determined separately according to the GPR bits in IOMUXC.
 - 128 MByte maximum supported density by default (AUS bit is cleared). When the AUS bit is set, maximum supported density is 32MBytes.
- Selectable write protection for each chip select
- Support for multiplexed address/data bus operation x16 and x32 port size
- Programmable data port size for each chip select (x8, x16 and x32)
- Programmable wait-state generator for each chip select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Supports asynchronous page mode accesses (x16 and x32 port size)
- Independent synchronous memory burst read mode support for NOR-Flash and PSRAM memories (x16 and x32 port size)
- Independent synchronous memory burst write mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Supports NAND-Flash devices with NOR-Flash like interface - OneNAND™ (Samsung)
- Independent programmable variable/fix latency support for read and write synchronous (burst) mode

- Support for little endian operation
- ARM AXI slave interface accesses only handled in parallel for single AXI ID transactions
- External interrupt support using the RDY_INT signal function as an external interrupt pin
- Boot from external device support according to boot signals, using the RDY_INT signal
 - RDY signal support assertion after reset
 - INT signal support assertion after reset for OneNAND™ (Samsung) device
 - Supports little endian mode only

6.4.2 EIM boot scenarios

EIM allows booting from NOR Flash devices. To select NOR Flash as the boot source, use either the boot mode and configuration GPIO pins or the internal boot-related fuses.

See [Sytem Boot](#) for more information.

6.4.3 EIM boot configuration

The following table shows the EIM boot configuration.

Table 6-2. EIM boot configuration

| EIM_BOOT_CFG bus | EIM affected bits | EIM register |
|------------------|-------------------|--------------|
| 12 | NUM16_BYP_GRANT | CS0GCR2 |
| 11 | DZS[2] | CS0GCR1 |
| 10 | AUS | CS0GCR1 |
| [9:8] | CSREC[2:1] | CS0GCR1 |
| [7:5] | RWSC[4:2] | CS0GCR1 |
| | WWSC[4:2] | CS0WCR |
| 4 | ERRST | WCR |
| 3 | RAL | CS0RCR1 |
| | WAL | CS0WCR |
| 2 | MUM | CS0GCR1 |
| | OEA[1] | CS0RCR1 |
| [1:0] | DSZ[1:0] | CS0GCR1 |

6.4.4 OneNAND requirements

Because Ready/Busy pin is not in use, OneNAND devices require the following actions:

- Poll the device to see whether it is ready; software performs a read from the device.
- Connect the Ready/Busy signal of the device to any GPIO pin and use it as an interrupt that indicates the on ready state.

Chapter 7

System Debug

7.1 Overview

This chapter describes the hardware and software debug and application development features and resources of the chip. It discusses the following:

- Core/platform-specific resources
- Resources associated with complex IP blocks
- Chip-wide resources
- Interface to the external debug and development tools

The debug and trace architecture is designed around the following:

- ARM's CoreSight architecture, adapted to i.MX 6Dual/6Quad SoC (for 2x and 4x core debug), including a cross-trigger subsystem for cross-domain triggering of debug resources
- JTAG port used to interact with cores under debug by means of SJC, the system JTAG controller port
- DAP, the debug access port that supports the interface to the ARM RealView Debugging tools and other third party tools
- TPIU, a trace port interface unit that efficiently accesses program trace information from the system
- Various chip-wide resources, such as debug features built into the IP blocks and critical signal visibility available through alternate pin functions or observability muxes

7.2 Chip and Cortex-A9 Core Platform Debug Architecture

ARM Cortex-A9 Debug architecture is based on CoreSight architecture by ARM Ltd. The CoreSight architecture provides a system wide solution to real-time debug and trace.

The CoreSight architecture is embodied in a set of CoreSight components and compliant processors that form CoreSight systems. Its architecture maintains the traditional requirements of debug and trace:

- To access debug functionality without software interaction;
- To connect to a running system without performing a reset.

Full access to the processor debug capability is available by the ARM Cortex-A9 debug register map through the Advanced Peripheral Bus (APB) slave port. The core includes a Processor Debug Unit allow which stops program execution, examines and alters the processor and coprocessor state, examines and alters the memory and input/output peripheral state and restarts the processor core.

7.2.1 Debug Features

- CoreSight Program Trace Macrocell (PTM): trace generator for the ARM Cortex A9™ core
- Support for a TrustZone-related 3-level debug scheme:
 - Debug in Non-Secure privileged and user, and Secure user
 - Debug in Non-Secure only
- EmbeddedICE-RT logic
 - Support for both monitor-mode and halt-mode debugging:
 - Core run/halt control, debug status/control
 - Breakpoint/watchpoint control
 - Core- and memory-mapped resource examination/modification
- Data communication channel between ARM core and host debugger via JTAG, and the Debug Access Port (DAP) module.
- PMU: Performance Metrics Unit used for system profiling and debug.
- CP15 register for debugging the MMU, I & D L1 cache, and TLB
- PL310 L2 Cache: Provides an event monitoring signal routed to pins for visibility to help in system debug.

The chip includes ARM CoreSight components for multicore debug and trace solutions.

See the following figure for the ARM debug architecture scheme.

- _____

- ROMPATCH module to support modification of program/data information in the MCU ROM
- Debug Visibility, which selects critical signals routed to the I/O pads as alternate outputs for external visibility

7.2.2.1 AMBA trace bus (ATB)

ATB transfers trace data through the CoreSight infrastructure in a chip. Trace sources are ATB masters and sinks are ATB slaves. The ARM (via PTM) cores are the data generators. Link components such as the Trace Funnel and Replicator provide both master and slave interfaces.

The ATB protocol supports:

- Stalling of trace sources to enable the CoreSight components to funnel and combine sources into a single trace stream.
- Association of the trace data with the generating source using trace source IDs. A CoreSight system can trace up to 111 different items at any one time.
- Capture and transfer of multiple byte bus widths, currently to 32 bits.
- A flushing mechanism to force historic trace to drain from any sources, links, or sinks up to the point that the request was initiated

7.2.2.2 ATB replicator

The ATB replicator enables two trace sinks to be wired together and to operate from the same incoming trace stream.

There are no programmable registers. This component is invisible to the user on a particular trace path, from source to sink.

- Incoming ATB Interface—The ATB replicator accepts trace data from the trace source, either directly or through a trace funnel.
- Outgoing ATB Interfaces—The ATB replicator sends identical trace data on outgoing master port interfaces.

7.2.2.3 Embedded Cross Triggering

The ECT is a modular component from ARM Limited that supports the interaction and synchronization of multiple triggering events within a chip. The main function of the ECT (CTI and CTM) is to pass debug events from one core to another. For example, the ECT can communicate debug state information from one core to another, so that program execution on both processors can be stopped at the same time if required.

The ECT consists of the following types of modules:

- Cross trigger interfaces (CTI)
- Cross trigger matrix (CTM)

Cross trigger interfaces provide the interface between a component or subsystem and the cross trigger matrix. The system requires a CTI for each subsystem that supports cross triggering. The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

The Cross Trigger Matrix (CTM) combines the trigger request generated from the CTIs and broadcasts them to all CTIs as channel triggers. The CTM controls the distribution of channel events. It provides Channel Interfaces (CIs) to connect to either CTIs or CTMs. This enables multiple CTIs to be linked together. The ECT is composed of three/five CTIs (Cross Trigger Interface) and two CTMs (Cross Trigger Matrix). The ECT is key in the multi-core and multi-IP debug strategy. The outcome is a SWcontrolled debug signal matrix that receives signals from various sources (i.e. cores and peripherals) and propagates/ routes them to the different debug resources of the SoC. Those debug resources can include time stamping capability, profiling capabilities, real-time trace (trace enabled or disabled), triggers, SOC level multiplexing, and debug interrupts.

NOTE

As the ECT should only be used during debug sessions, it is off (disabled) by default.

The ECT features are enabled by enabling the individual CTIs. It is only allowed in supervisor mode, after having presented a suitable key to the CTI CTILOCK register. The CTI has eight inputs (trigger inputs) and eight outputs (trigger outputs) to the core/ chip and four inputs and outputs to the CTM (channel triggers).

7.2.2.3.1 Cross-Trigger Matrix (CTM)

The CTM (Cross Trigger Matrix) is provided by ARM. A brief description is provided below. It is advised to refer to ARM documentation for more details.

The CTM is a relatively simple block with no configuration options. There are two CTM instances in i.MX6Dual/6Quad in ARM Platform.

One of them is used to route 4x Core's CTI's, while the second one, is used for additional CoreSight CTI. Each CTI has 4 channel lines, which CTI events are mapped to. The exact mapping is configured in the CTI logic.

7.2.2.3.2 Cross-Trigger Interface (CTI)

The Cross-Trigger Interface (CTI) component is provided by ARM. A brief description of the CTI is provided below.

There are 5 CTIs in the chip's ARM platform. Four are of which, dedicated to each Core, while the 5th is used for various other signals routing.

Each of these CTIs has 8 trigger inputs and 8 trigger outputs that connect to logic in the domain to be debugged or profiled. Each CTI also includes a 4 channel interface to the CTM (4 inputs and 4 outputs).

For more information, see [../././block_guide_library/arm_a9/map_arm_a9.xml](#).

7.2.2.4 Debug Access Port (DAP)

The DAP enables debug access to the chip modules through APB-AP (the APB access port) and APB-Mux (the APB multiplexer).

AHB-AP provides system access. Debug tools can use JTAG to connect to the chip.

DAP has the following features:

- AMBA 3 Peripheral Bus Multiplexor access through AMBA 3 APB Access Port, providing debug peripheral access through the APB interface.
- External JTAG access using the JTAG Debug Port (JTAG-DP).
- Internal chip module access using:
 - AHB Access Port (AHB-AP)
 - APB Access Port (APB-AP)
 - JTAG Access Port (JTAG-AP)

APB-Mux enables system access to CoreSight components connected to the Debug APB.

The ROM table provides a list of memory locations of CoreSight components connected to the Debug APB. This is visible from both tools and system access and one configures it during system implementation.

External read/write access to the internal interface is provided by JTAG-DP. JTAG-DP provides a standard interface for debug access to the chip through DAP. It interfaces to the DAP internal bus.

Internal access to on-chip buses and other interfaces are provided by the access ports (APs). The available APs are:

- AHB-AP which provides an AHB-Lite master for access to a system AHB bus.
- APB-AP which provides an AMBA 3 APB master for access to the Debug APB that configures all CoreSight components.
- JTAG-AP which provides JTAG access to on-chip components and operates as a JTAG master port to drive JTAG chains throughout the chip.

7.2.2.5 CoreSight trace port interface (TPIU)

TPIU is one of the CoreSight trace sink components. It acts as a bridge between the on-chip trace data and a data stream that is then driven out the trace port.

TPIU uses the ATB interface to accept trace data from a trace source, either directly or by using a trace funnel. TPIU has 32 bit port connected to the chip pad.

The APB interface is the programming interface for the TPIU configuration.

The features of the sub-blocks are as follows:

- Formatter—Inserts source ID signals into the data packet stream so that the trace data can be re-associated with the trace source.
- Asynchronous FIFO—Enables trace data to be driven out at a speed that is not dependent on the on-chip bus clock.
- Register Bank—Contains the management, control and status registers for triggers, flushing behavior and external control.
- Trace out—The Trace out block serializes the formatted data before it goes off-chip.
- Pattern Generator—The Pattern Generator unit provides a simple set of defined bit sequences or patterns that can be output over the Trace Port and be detected by the TPA or other associated Trace Capture Device (TCD). The TCD can use these patterns to indicate if it is possible to increase or decrease the trace port clock speed.

The TPIU accepts trace data from a trace source, either direct from a trace source or using a Trace Funnel. The APB interface is the programming interface for the TPIU. The Trace Clock driving the data out to external pins can be obtained from either an on chip or off chip source, selectable via a mux.

The output of the TPIU is connected via external pins (MPS of TRACEDATA in Figure 8-8, which can be in the range of 1–16 bits). The system may utilize double data rate pins to either use a lower clock speed than that of the 32-bit ATB interface, or use fewer than

32 data pins for the output, based on the ability of the technology used. Given the speed of the ATB, 32 data pins with double data rate is recommended, with the external interface running at half the speed of the ATB. The speed of the external interface is from TRACECLKIN, and should be selectable via an on chip or off chip clock. TRACECLK is equal to TRACECLKIN / 2, and is divided in the TPIU to clock trace data at the trace capture unit.

TPIU used to be part of the ARM platform sub blocks in previous versions of i.MX products, placing the TPIU off platform allows future debug trace sources from the chip level to connect to the TPIU by means of a funnel.

For more information, see [Program Trace Macrocell \(PTM\)](#)

7.2.3 i.MX6Dual/6Quad-Specific SJC Features

7.2.3.1 JTAG Disable Mode

In addition to four different JTAG security modes that are implemented internally in the System JTAG Controller (SJC), there is an option to disable the SJC functionality by e-fuse configuration.

This creates additional JTAG mode "JTAG Disabled" with highest level of JTAG protection. In this mode all JTAG features are disabled. Specifically, the following debug features are disabled in addition to the features that were already disabled in "No Debug" JTAG mode:

- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

7.2.3.2 JTAG ID

Table 7-1. i.MX JTAG ID

| Device | Silicon revision | JTAG ID (ID CODE) |
|------------|------------------|-------------------------|
| i.MX 6Dual | Rev 1.0 | 0191_E01Dh ¹ |
| i.MX 6Quad | Rev 1.0 | 0191_C01Dh ² |

1. In follow-on silicon revisions, the ID value is subject to change by incrementing the first nibble as follows: 1191_E01Dh for Rev 1.1, 2191_E01Dh for Rev 1.2 , etc.
2. In follow-on silicon revisions, the ID value is subject to change by incrementing the first nibble as follows: 1191_C01Dh for Rev 1.1, 2191_C01Dh for Rev 1.2 , etc.

7.2.4 System JTAG Controller - SJC

The SJC module is the bridge between external development and test instrumentation and the internal JTAG-accessible debug and test resources.

It implements and manages the daisy-chained topology consisting of its own TAP and those of the SDMA, and the ARM Debug Access Port (DAP).

The DAP itself has a JTAG serial links, which can drive the PCIe PHY and SATA PHY's JTAG logic, used for testing of the PHYs.

NOTE

Single Wire Debug (SWD) protocol is not supported.

7.2.5 System JTAG controller main features

- IEEE P1149.1, 1149.6 (standard JTAG) interface to off-chip test and development equipment
 - Includes an SJC-only mode for true IEEE P1149.1 compliance, used primarily for board-level implementation of boundary scan.
 - Supports IEEE P1149.6 extensions to the JTAG standard for AC testing of selected I/O signals.
- Debug-related control and status; putting selected cores into reset and/or debug mode and monitoring individual core status signals by means of JTAG
- System status, such as the state of the PLLs (locked or not locked)
- Four levels of security, ranging from no security to no JTAG accessibility to the chip

7.2.6 SCJ TAP Port

The SJC supports the following standard JTAG pins:

- TRSTB
- TDI
- TDO
- TCK
- TMS

7.2.7 SJC main blocks

- Interface to the outside world via the standard JTAG pins
- Interface to the external Debug_Event pin
- A master TAP controller which implements the standard JTAG state machine
- Implementation of the mandatory and optional IEEE P1149.1 (JTAG) instructions
 - Mandatory: "EXTEST", "SAMPLE/PRELOAD", and "BYPASS"
 - Optional: "ID_CODE" (SOC JTAG ID register), "HIGHZ"
- Implementation IEEE P1149.6 (JTAG) mandatory instructions:
 - "EXTEST_PULSE" and "EXTEST_TRAIN". These two instructions enable edge-detecting behavior on the signal path containing AC pins.
- Supports the SDMA's DR-path-only JTAG architecture by implementing the controller portion of its TAP (including "BYPASS" as the default state) within the SJC
- The ExtraDebug registers, which implement a variety of control and status features
 - Three 32-bit insecure general purpose status registers
 - Two 32-bit secure status registers - one predefined, one general purpose.
 - Control and status registers for debug, core, charge pump, and PLL.
- Four levels of fuse-defined security, ranging from no security to no access.

Both predefined and user-defined (SOC integration team) control and status functions are supported by the SJC.

The user-defined functions will be defined and documented by the SOC integration team.

7.3 Smart DMA (SDMA) core

SDMA is a dedicated, programmable DMA engine. It is an integration of a 32-bit RISC core and DMA-specific hardware. It includes ports for the AP domain and a peripheral domain, along with a burst-capable port for direct external memory access.

The SDMA and its integration in the chip is unchanged from previous i.MX chips.

The main SDMA debug features are:

- OnCE - On Chip Emulator, provides the following capabilities:
 - SDMA core control - run/halt/single-step
 - SDMA core register/memory-map access
 - Event detection, watchpoints, and hardware breakpoints
 - Real time buffer and PC trace buffer capability
- Trace buffer
 - Contains information to identify the 32 last changes of flow detected during a program execution

- Context dump
 - Includes information about all the channel dump activity
 - Current contents of SDMA RAM
- ROMPATCH

7.3.1 SDMA On Chip Emulation Module (OnCE) Feature Summary

The SDMA debug features are primarily defined by the OnCE portion of its design.

They are summarized as follows:

- Memory And Register Access - dedicated logic enables user-access to SDMA memory and register locations. These accesses are supported only when the processor is in debug mode.
- Event Detection Unit - watches signals from the data memory bus (DMBus) which is used by the RISC core to access its RAM, ROM, and memory-mapped registers
- Watchpoints - one output signal is available to watch event matching conditions at the chip level. Match conditions are defined by programming memory-mapped registers.
- Hardware Breakpoint - a counter is decremented after an event detection. A debug request is sent to the SDMA core only when the counter reaches the value of zero. It is possible to program the initial value of the counter or to disable the use of the counter if a debug request must be generated after each event detection.
- Real Time Buffer - The Real Time Buffer Register (RTB) is a single 32-bit memory-mapped register which can be accessed as a regular memory location during program execution. It is used to store and retrieve run time information without putting the SDMA in debug mode. Each write to this register causes an event. This register is, in fact, located in the OnCE. Executing through JTAG, a buffer command exports the content of this register through the JTAG port.
- Core Control (Core Status / Single Stepping) - Commands are provided to monitor and control processor activity. The commands can halt the core, rerun the core from another address location, and get processor status.
- Trace Buffer - a 32x32 buffer which records the last 32 changes of flow during program execution. The buffer stores data in a modulo fashion (i.e. the 33rd instruction change replaces the 1st). Captured trace information is retrieved via reads to the Trace Buffer Register.

7.3.1.1 Other SDMA Debug Functionality

- Core Trace - basic core trace capability is available through debug visibility functionality only. PTM trace capability does not exist.
- ROM Patch - can be accomplished by manipulating the CHN0ADDR register through JTAG or via the MCU's ability to write to SDMA OnCE registers. This must be done right after reset and before the SDMA core is enabled to begin processing events.
- Additional debug control/status interaction with the SJC module
 - SJC-controlled Debug Request
 - SJC-readable Debug Acknowledge (in debug mode)
 - Debug clock control - allows SJC to force clocks on for debug purposes
 - Debug core state (SDMA RISC Core State) - 4 bits accessible from the SJC via JTAG

7.3.1.2 SDMA ROM Patching

After reset, the SDMA is in its IDLE_AFTER_RESET mode. A debug request also puts the SDMA in its DEBUG_IN_IDLE_AFTER_RESET mode. The new address boot must be stored in CHN0ADDR register (e.g., through the SDMA OnCE via debugger).

The user must then issue the `exec_core <instruction> SDMA OnCE` instruction to return to the IDLE_AFTER_RESET mode. The very first instructions of the boot code fetches the contents of this register (which is also mapped in the SDMA memory space) and jumps to the given address.

7.4 Miscellaneous

7.4.1 Clock/Reset/Power

CDBGPWRUPREQ and CDBGPWRUPACK are the handshake signals between the DAP and the clock control module to ensure debug power and clocks are turned on. If the debug components are always powered on, the handshake becomes a mechanism to turn debug clocks on. Similarly, there is a register bit in the CCM which allows internal software to turn debug clocks on as well because the CDBGPWRUPREQ is in the TCLK domain and is inaccessible to software.

The Cortex-A9 and VSP cores can receive resets from the following sources:

- Debug Reset (CDBGIRSTREQ bit within the SWJ-DP CTRL/STAT register of the DAP) in the TCLK domain. This allows the debug tools to reset the debug logic.
- System POR reset

Conversely, the debug system is capable of generating a system reset via a request bit in the MDM-AP control register. This allows the debugger to hold the system in reset.

7.5 Supported tools

RealView™ ARM Debugger is supported.

The debugger is connected to the chip from the host by the RealView ICE protocol converter. Other 3rd party tools can be used via the standard JTAG interface, but may need to be adapted for individual IC. It is important to check with tool vendors for specific tool requirements, especially for on-chip IC.

Chapter 8

System Boot

8.1 Overview

The boot process begins at Power On Reset (POR) where the hardware reset logic forces the ARM core to begin execution starting from the on-chip boot ROM.

Boot ROM code uses the state of the internal register `BOOT_MODE[1:0]` as well as the state of various eFUSES and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Serial downloader support (USB OTG)
- Device configuration data (DCD) and plugin
- Digital signature and encryption based High Assurance Boot (HAB)
- Wake-up from low power modes
- Wake-up secondary core
- Plugin image

The boot ROM supports the following boot devices:

- NOR Flash
- NAND Flash
- OneNAND Flash
- SD/MMC
- Serial ATA (SATA) HDD (only i.MX 6Dual/6Quad)
- Serial (I2C/SPI) NOR Flash and EEPROM

In normal operation, the Boot ROM uses the state of the `BOOT_MODE` register and eFUSES to determine the boot device. For development purposes, eFUSES used to determine the boot device may be overridden by using GPIO pin inputs.

Boot ROM code also allows the downloading of programs to be run on the device. An example is a provisioning program that can make further use of the serial connection to provision a boot device with a new image. Typically the provisioning program is downloaded to internal RAM and allows the programming of boot devices, such as an SD/MMC Flash. The ROM Serial Downloader uses high speed USB in a non-stream mode connection.

Boot ROM allows waking up from low-power modes and waking up the secondary core of Cortex-A9. On reset the ROM checks the ARM core ID and power gating status register. On waking from low power mode, the primary core (ID=0) will skip loading an image from the boot device and jump to the address saved in `PERSISTENT_ENTRY0`. The secondary cores (ID!=0) jump to the address in `PERSISTENT_ENTRY<X>` where $0 < X < 4$ in all power modes.

The device configuration data (DCD) feature allows boot ROM code to obtain SOC configuration data from an external Program Image residing on the boot device. As an example, DCD can be used to program the DDR controller for optimal settings improving the boot performance. DCD is restricted to memory areas and peripheral addresses that are considered essential for boot purposes (see [Table 8-35](#)).

A key feature of the boot ROM is the ability to perform a secure boot or High Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. HAB uses a combination of hardware and software together with a Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized programs. Before the HAB allows a user's image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as part of the final Program Image. If configured to do so, the ROM verifies the signatures using the public keys included in the Program Image. In addition to supporting digital signature verification to authenticate Program Images, Encrypted boot is also supported. Encrypted boot can be used to prevent cloning of the Program Image directly off the boot device. A secure boot with HAB can be performed on all boot devices supported on the chip in addition to the Serial Downloader. The HAB library in the boot ROM also provides API functions, allowing additional boot chain components (bootloaders) to extend the secure boot chain. The out-of-fab setting for `SEC_CONFIG` is the Open configuration in which the ROM/HAB performs image authentication, but all authentication errors are ignored and the image is still allowed to execute.

8.2 Boot modes

During reset, the chip checks ARM core ID and Power Gating Controller status register.

On normal boot, the core's behavior is defined by the Boot Mode pins settings as described in [Boot mode pin settings](#). On waking up from low power boot mode, the core skips clock settings. Boot ROM checks that PERSISTENT_ENTRY0 (see [Persistent Bits](#)) is a pointer to valid address space (OCRAM, DDR or EIM). If PERSISTENT_ENTRY0 is a pointer to valid range, it starts execution using entry point from PERSISTENT_ENTRY0 register. If PERSISTENT_ENTRY0 is a pointer to invalid range, the core performs system reset.

For secondary cores (with ID!=0) boot ROM checks that PERSISTENT_ENTRY is a pointer to valid address space (OCRAM, DDR or EIM). If PERSISTENT_ENTRY is a pointer to valid range, it starts execution using entry point from PERSISTENT_ENTRY register. If PERSISTENT_ENTRY is a pointer to invalid range, it sets error status registers (see [Persistent Bits](#)), sends wakeup error interrupt and performs Wait For Interrupt instruction. The interrupt service routine of the other core must reconfigure the system and reset the secondary core that failed to boot.

NOTE

Code that enables the secondary cores is not part of ROM, but it must be part of upper level software.

8.2.1 Boot mode pin settings

The device has four boot modes (one is reserved for Freescale use). Boot mode is selected based on the binary value stored in the internal BOOT_MODE register.

BOOT_MODE is initialized by sampling the BOOT_MODE0 and BOOT_MODE1 inputs on the rising edge of POR_B. After these inputs are sampled, their subsequent state does not affect the contents of the BOOT_MODE internal register. The state of the internal BOOT_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC_SBMR2). The available boot modes are: Boot From Fuses, serial boot via USB, and Internal Boot. See the table below for settings.

Table 8-1. Boot MODE Pin Settings

| BOOT_MODE[1:0] | Boot Type |
|----------------|-------------------|
| 00 | Boot From Fuses |
| 01 | Serial Downloader |
| 10 | Internal Boot |
| 11 | Reserved |

```

    UpdateError --> SendInterrupt[Send Wakeup Error Interrupt]
    SendInterrupt --> WaitReset([Wait For Reset])
  
```

The flowchart illustrates the boot process for the Cortex-A9 MPIDR. It begins with a 'Reset' state, leading to a decision 'Check CPU ID (using Cortex-A9 MPIDR)'. If the CPU ID is 0, it proceeds to 'Check Reset Type'. If the reset type is 'Wakeup From Low Power Mode', it uses a wakeup handler and arguments from SRC registers, then checks if the wakeup handler is in a valid range. If not, it checks the CPU ID again. If the CPU ID is 1, 2, or 3, it also checks the wakeup handler. If the wakeup handler is valid, it proceeds to 'Execute Image'. If the reset type is 'Normal', it checks the boot mode (using fuses and/or GPIOs). If the boot mode is 'Internal', it downloads the initial boot image (primary or secondary depending on the persistent bit). If the download fails, it checks if it's the primary image. If yes, it sets the secondary image persistent bit and performs a software reset, then ends. If no, it checks if the primary boot device is I2C/eCSP. If yes, it proceeds to 'Execute Image'. If no, it downloads and authenticates the image from Serial EEPROM. If that fails, it downloads and authenticates the image via USB. If either download fails, it loops back to the previous step. If successful, it proceeds to 'Execute Image'. If the boot mode is not 'Internal', it proceeds to 'Execute Image'.

NOTE

8.2.3 Boot From Fuses Mode (BOOT_MODE[1:0] = 00b)

Freescale Semiconductor, Inc.

This mode is similar to the Internal Boot mode described in [Internal Boot Mode](#) (`BOOT_MODE[1:0] = 0b10`) with one difference. In this mode the GPIO boot override pins are ignored. The boot ROM code uses the boot eFUSE settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the `BT_FUSE_SEL` eFUSE value. If `BT_FUSE_SEL = 0`, indicating that the boot device (for example, Flash, SD/MMC) has not yet been programmed, the boot flow jumps directly to the Serial Downloader. If `BT_FUSE_SEL = 1`, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device.

The first time a board is used, the default eFUSES may be configured incorrectly for the hardware on the platform. In such a case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using Boot From Fuses mode addresses this problem.

The first time the `BT_FUSE_SEL = 0` eFUSE is encountered, it is not blown (thus setting `BT_FUSE_SEL`). This forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a Program Image and blow the `BT_FUSE_SEL` and the other boot configuration eFUSES. After reset, the Boot ROM code determines that `BT_FUSE_SEL` is blown (`BT_FUSE_SEL = 1`) and the ROM code performs internal boot according to the new eFUSE settings. This allows a user to set `BOOT_MODE[1:0]=00b` on a production device and burn fuses on the same device (by forcing entry to the Serial Downloader), without changing the value of `BOOT_MODE[1:0]` or pullups/pulldowns on the `BOOT_MODE` pins.

8.2.4 Serial Downloader

The Serial Downloader provides a means to download a Program Image to the chip over USB serial connection.

In this mode the ROM programs WDOG-1 for a 32-second time-out if `WDOG_ENABLE` eFuse is 1, and then continuously polls for USB connection. If no activity is found on USB OTG1 and the watchdog timer expires, the ARM core is reset.

NOTE

The downloaded image must continue to service the watchdog timer to avoid an undesired reset from occurring.

The USB boot flow is shown in the figure below.

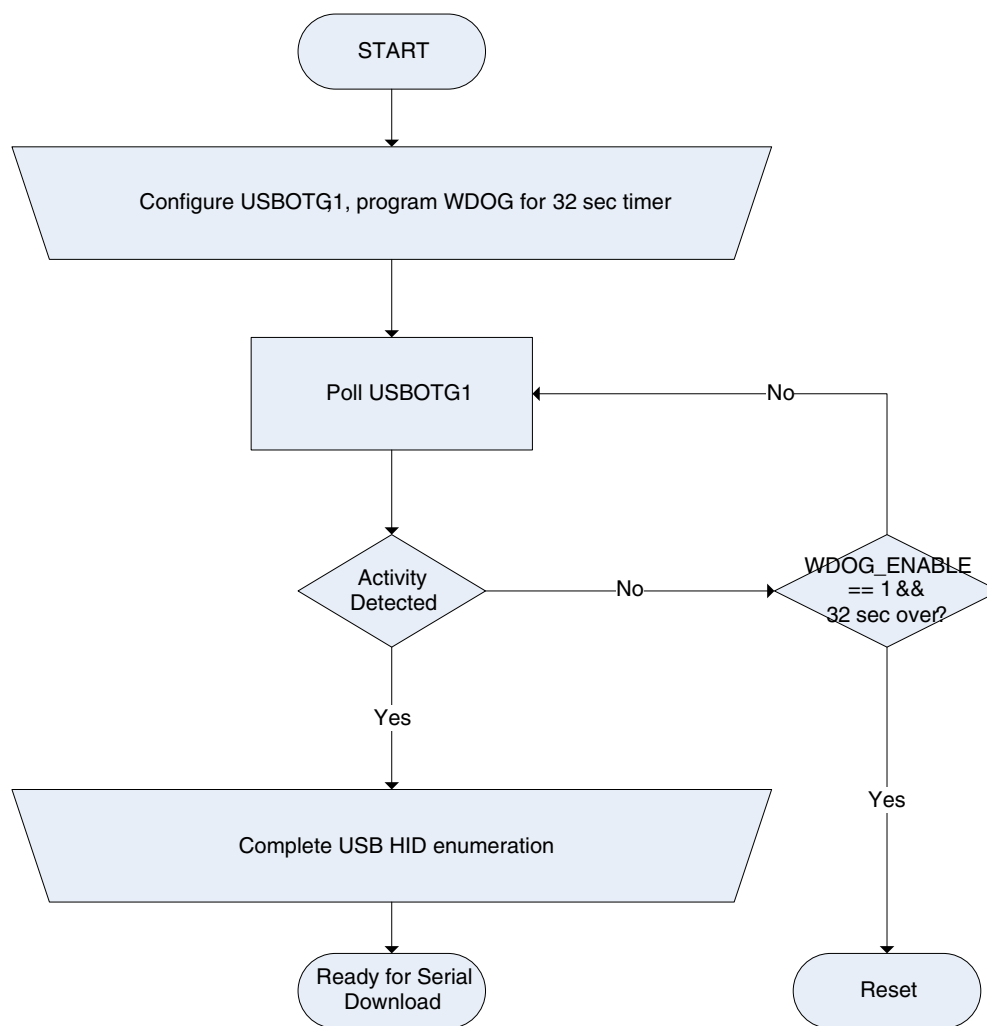

Figure 8-2. USB Boot Flow

8.2.5 Internal Boot Mode (BOOT_MODE[1:0] = 0b10)

A value of 0b10 in the BOOT_MODE[1:0] register selects the internal boot mode. In this mode, the processor continues to execute boot code from the internal boot ROM.

The boot code performs hardware initialization, loads the Program Image from the chosen boot device, performs image validation using the HAB library (see [Boot security settings](#)), and then jumps to an address derived from the Program Image. If any error occurs during internal boot, the boot code jumps to the Serial Downloader (see [Serial Downloader](#)). A secure boot using the HAB is possible in all the three boot modes.

When set to internal boot, the boot flow may be controlled by a combination of eFUSE settings with an option of overriding the fuse settings using General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT_FUSE_SEL) determines whether the ROM uses GPIO pins for a select number of configuration parameters or eFUSES in this mode. See [Table 8-4](#) for more details.

- If BT_FUSE_SEL = 1, all boot options are controlled by the eFUSES described in [Table 8-2](#).
- If BT_FUSE_SEL = 0, specific boot configuration parameters may be set using GPIO pins rather than eFUSES. The fuses that can be overridden when in this mode are indicated in the GPIO column of [Table 8-2](#). [Table 8-3](#) provides the details on the GPIO pins.

The use of GPIO overrides is intended for development since these pads are used for other purposes in deployed products. Freescale recommends controlling the boot configuration by eFUSES in deployed products and reserving the use of the GPIO mode for development and testing purposes only.

8.2.6 Boot security settings

Internal boot modes use one of three security configurations:

- **Closed:** This level is intended for use with shipping secure products. All HAB functions are executed and security hardware is initialized (the Security Controller, or SNVS, enters Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, and the boot flow aborted with control passing to the serial downloader. At this level, execution does not leave the internal ROM unless the target executable image has been authenticated.
- **Open:** This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed as for a closed device. Security hardware is initialized (except the SNVS is left in Non-Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, but have no influence on the boot flow, which continues as if the errors did not occur. This configuration is useful for secure product development, since the Program Image will run even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of authentication failure.
- **Field Return:** This level is intended for parts returned from shipped products.

NOTE

If the DIR_BT_DIS eFuse is not blown, authentication may be bypassed. In this case the system is not secure.

8.3 Device Configuration

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes boot device selection (SPI, EIM, NOR, SD, MMC, etc.), boot device configuration (SD bus width, speed, etc), and so on. In general, the source for this configuration comes from eFUSES embedded inside the chip. However, certain configuration parameters can be sourced from GPIO pins allowing further flexibility during the development process.

8.3.1 Boot eFUSE Descriptions

The table below is a comprehensive list of the configuration parameters that the ROM uses.

Table 8-2. Boot eFUSE Descriptions

| Fuse | Configuration | Definition | GPIO ¹ | Shipped Value | Settings ² |
|-------------|---------------|--|-------------------|---------------|--|
| DIR_BT_DIS | OEM | Disables Freescale reserved modes. Must be set for secure boot. | NA | 0 | 0 Reserved Freescale modes enabled 1 Reserved Freescale modes disabled |
| BT_FUSE_SEL | OEM | In internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are controlled by GPIO pins or eFUSE settings in the On-Chip OTP Controller (OCOTP). In Boot From Fuse mode BOOT_MODE[1:0] = 00, BT_FUSE_SEL fuse indicates whether bit configuration eFuses have been programmed. | NA | 0 | If BOOT_MODE[1:0] = 0b10 0 Bits of SBMR are overridden by GPIO pins. 1 Specific bits of SBMR are controlled by eFUSE settings. If BOOT_MODE[1:0] = 0b00 0 BOOT configuration eFuses are not yet programmed. Boot flow jumps to serial downloader. 1 BOOT configuration eFuses have been programmed. Regular boot flow is performed. |

Table continues on the next page...

**Table 8-2. Boot eFUSE Descriptions
(continued)**

| Fuse | Configuration | Definition | GPIO ¹ | Shipped Value | Settings ² |
|--|--|---|-------------------|---------------|---|
| SEC_CONFIG[1:0] | SEC_CONFIG[0] - Freescale SEC_CONFIG[1] - OEM | Security Configuration as defined in Boot security settings | NA | 01 | 00 Reserved 01 Open (allows any program image, even if authentication fails) 1x Closed (Program image executes only if authenticated) |
| FIELD_RETURN | OEM | Enables Freescale reserved modes | | | 0 - Freescale reserved modes are enabled/disabled based on DIR_BT_DIS value 1 - Freescale reserved modes are enabled |
| SRK_HASH[255:0] | OEM | 256-bit hash value of super root key (SRK_HASH) | NA | 0 | Settings vary - used by HAB |
| DIE-X-COORDINATE[7:0] DIE-Y-COORDINATE[7:0] WAFER_NO[4:0] LOT_NO_ENC[42:40] LOT_NO_ENC[39:32] LOT_NO_ENC[31:24] LOT_NO_ENC[23:16] LOT_NO_ENC[15:8] LOT_NO_ENC[7:0] | Freescale | Device Unique ID, 64-bit UID. | NA | Unique ID | Settings vary - used by HAB |
| BT_MMU_DISABLE (BOOT_CFG3[6]) | OEM | MMU/L1 D Cache/PL310 disable bit used by boot ROM for fast HAB processing | Yes | 0 | 0 - MMU/L1 D Cache/PL310 is enabled by ROM during the boot 1 - MMU/L1 D Cache/PL310 is disabled by ROM during the boot |
| L1 I-Cache DISABLE (BOOT_CFG3[7]) | OEM | L1 I Cache disable bit used by boot during entire execution | Yes | 0 | 0 - L1 I Cache is enabled by ROM during the boot 1 - L1 I Cache is disabled by ROM during the boot |
| BT_FREQ (BOOT_CFG3[2]) | OEM | Frequency Selection | Yes | 0 | 0 - ARM - 792MHz, DDR - 532MHz, AXI - 264MHz 1 - ARM - 396MHz, DDR - 352MHz, AXI - 176MHz |
| BOOT_CFG1[7:0] | OEM | Boot Configuration1 | Yes | 0 | Specific to selected boot mode |
| BOOT_CFG2[7:0] | OEM | Boot Configuration2 | Yes | 0 | Specific to selected boot mode |
| BOOT_CFG4[6:0] | OEM | Boot Configuration4 | | 0 | Specific to selected boot mode |

Table continues on the next page...

**Table 8-2. Boot eFUSE Descriptions
(continued)**

| Fuse | Configuration | Definition | GPIO ¹ | Shipped Value | Settings ² |
|----------------------------------|---------------|---|-------------------|---------------|---|
| BOOT_CFG4[7] | OEM | Infinite Loop Enable at start of boot ROM. Used for debugging purposes. Ignored if DIR_BT_DIS is 1 and FIELD_RETURN is 0. | Yes | 0 | 0 - Disabled 1 - Enabled |
| LPB_BOOT | OEM | USB Low Power Boot | No | 0 | 00 - LPB Disable 01 - 1 GPIO (default frequencies) 10 - Divide by 2 11 - Divide by 4 |
| BT_LPB_POLARITY | OEM | USB Low Power Boot GPIO polarity | No | 0 | 0 - low on GPIO pad indicates low power condition 1 - high on GPIO pad indicates low power condition |
| WDOG_ENABLE | OEM | Watchdog reset counter enable | No | 0 | 0 - watchdog reset counter is disabled during serial downloader 1 - watchdog reset counter is enabled during serial downloader |
| MMC_DLL_DLY[6:0] | OEM | uSDHC Delay Line settings | No | 0 | uSDHC Delay Line settings |
| SRK_REVOKE[2:0] | OEM | SRK revocation mask | No | 0 | SRK revocation mask |
| PAD_SETTINGS | OEM | Override values for SD/MMC and NAND boot modes | No | 0 | Override the following IO PAD settings: PAD_SETTINGS[0] - Slew Rate PAD_SETTINGS[3:1] Drive Strength PAD_SETTINGS[5:4] - Speed Settings . |
| OVERRIDE_HYS_SD_MMC_PADS | OEM | Overrides HYS bit for SD pads | No | 0 | Override the IO PAD setting HYS to 1 for SD pads |
| eMMC_4.4_RESET_TO_PRE-IDLE_STATE | OEM | ROM reset the boot device in pre-idle state using eMMC 4.4 feature, CMD0 with argument value 0xf0f0f0 | No | 0 | Applicable for booting from eMMC 4.4 spec or greater version devices. The fuse should not be blown for eMMC 4.3 or lesser spec version devices. |

- Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.
- 0 = intact fuse and 1= blown fuse

8.3.2 GPIO Boot Overrides

The table below provides a list of GPIO boot overrides.

Table 8-3. GPIO Override Contact Assignments

| Package Pin | Direction on reset | eFuse |
|-------------|--------------------|---------------------|
| BOOT_MODE1 | Input | Boot Mode Selection |
| BOOT_MODE0 | Input | |
| EIM_DA0 | Input | BOOT_CFG1[0] |
| EIM_DA1 | Input | BOOT_CFG1[1] |
| EIM_DA2 | Input | BOOT_CFG1[2] |
| EIM_DA3 | Input | BOOT_CFG1[3] |
| EIM_DA4 | Input | BOOT_CFG1[4] |
| EIM_DA5 | Input | BOOT_CFG1[5] |
| EIM_DA6 | Input | BOOT_CFG1[6] |
| EIM_DA7 | Input | BOOT_CFG1[7] |
| EIM_DA8 | Input | BOOT_CFG2[0] |
| EIM_DA9 | Input | BOOT_CFG2[1] |
| EIM_DA10 | Input | BOOT_CFG2[2] |
| EIM_DA11 | Input | BOOT_CFG2[3] |
| EIM_DA12 | Input | BOOT_CFG2[4] |
| EIM_DA13 | Input | BOOT_CFG2[5] |
| EIM_DA14 | Input | BOOT_CFG2[6] |
| EIM_DA15 | Input | BOOT_CFG2[7] |
| EIM_A16 | Input | BOOT_CFG3[0] |
| EIM_A17 | Input | BOOT_CFG3[1] |
| EIM_A18 | Input | BOOT_CFG3[2] |
| EIM_A19 | Input | BOOT_CFG3[3] |
| EIM_A20 | Input | BOOT_CFG3[4] |
| EIM_A21 | Input | BOOT_CFG3[5] |
| EIM_A22 | Input | BOOT_CFG3[6] |
| EIM_A23 | Input | BOOT_CFG3[7] |
| EIM_A24 | Input | BOOT_CFG4[0] |
| EIM_WAIT | Input | BOOT_CFG4[1] |
| EIM_LBA | Input | BOOT_CFG4[2] |
| EIM_EB0 | Input | BOOT_CFG4[3] |
| EIM_EB1 | Input | BOOT_CFG4[4] |

| EIM_EB2 | Input | BOOT_CFG4[6] |
| EIM_EB3 | Input | BOOT_CFG4[7] |

The input pins provided are sampled at boot, and can be used to override corresponding eFUSE values, depending on the setting of the BT_FUSE_SEL fuse. Table below describes boot options control sampling in different boot modes.

Table 8-4. Boot Options Control Selection

| BOOT_MODE[1:0] | BT_FUSE_SEL Value | Boot Options Controlled By |
|----------------|-------------------|----------------------------|
| 00 | 0 | eFUSEs |
| | 1 | |
| 01 | 0 | GPIO pins |
| | 1 | eFUSEs |
| 10 | 0 | GPIO pins |
| | 1 | eFUSEs |

8.3.3 Device Configuration Data

DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various on-chip peripherals. See [Device Configuration Data \(DCD\)](#) for more details on Device Configuration Data.

8.4 Device Initialization

This section describes the details on the ROM and provides initialization details.

This includes details on:

- The ROM Memory Map
- The RAM Memory Map
- On-chip blocks that the ROM should make use of or change POR register default values
- Clock initialization
- Enabling the MMU/L2 cache when performing a secure boot (SEC_CONFIG = Closed)
- Exception handling and interrupt handling

8.4.1 Internal ROM /RAM memory map

[Figure 8-3](#) shows the iROM memory map for the i.MX 6Dual/6Quad.

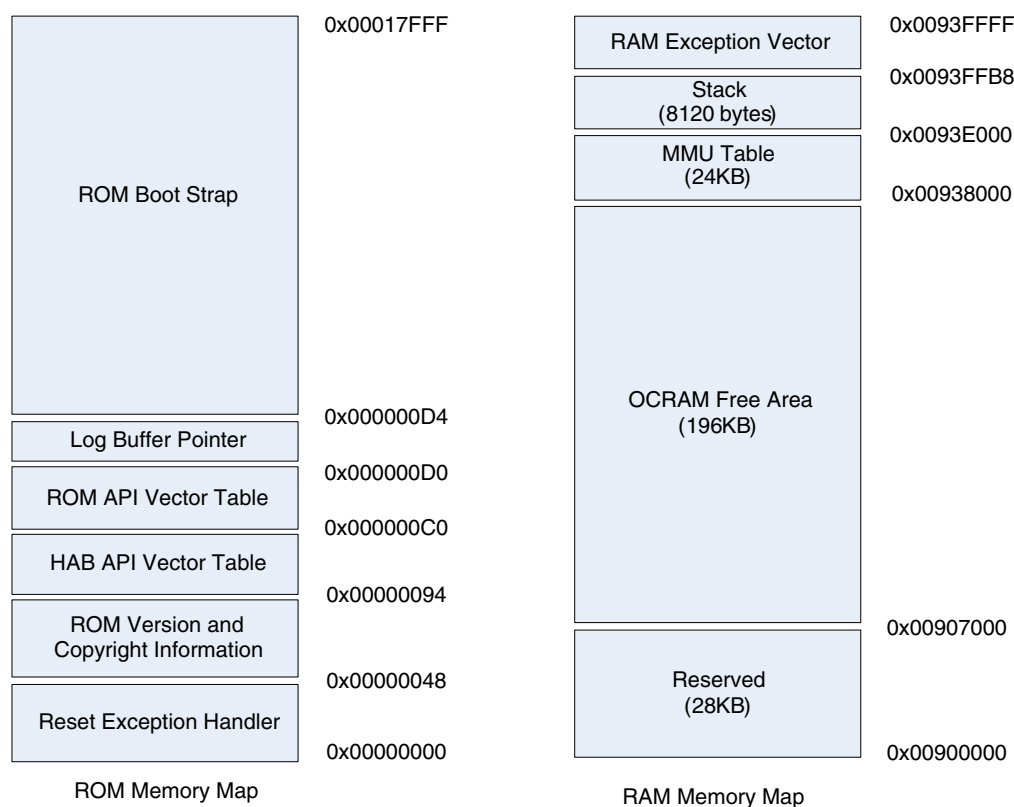

Figure 8-3. Internal ROM and RAM memory map for i.MX 6Dual/6Quad

NOTE

The entire OCRM region can be used freely post boot.

8.4.2 Boot Block Activation

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

The ROM configures and uses the following blocks (listed in alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and boot device selection:

- APBH - DMA engine to drive the GPMI module
- BCH - 40-bit error correction hardware engine with AXI bus master and private connection to GPMI
- CCM - Clock Control Module
- ECSPI - Enhanced Configurable Serial Peripheral Interface
- EIM - External Interface Module. Used for NOR and OneNAND devices

- I2C - I2C Controller
- GPMI - NAND controller pin interface
- OCOTP_CTRL - On-Chip OTP Controller. The OCOTP contains the eFUSES.
- IOMUXC - I/O Multiplexer Control allows GPIO use to override eFUSE boot settings
- CAAM - Cryptographic Acceleration and Assurance Module
- SNVS - Secure Non-Volatile Storage
- SRC - System Reset Controller
- USB - Used for serial download of a boot device provisioning program
- USDHC - Ultra Secure Digital Host Controller
- WDOG-1 - Watchdog Timer
- DTCP - Digital Transmission Content Protection
- HDCP - High-bandwidth Digital Content Protection

8.4.3 Clocks at Boot Time

The table below shows the various clocks and their sources used by ROM.

Table 8-5. Normal Frequency Clocks Configuration

| Clock | CCM signal | Source | Frequency(MHz) BT_FREQ=0 | Frequency(MHz) BT_FREQ=1 |
|----------------|--|-------------------|-----------------------------|-----------------------------|
| System PLL | pll1_sw_clk | | 792 | 792 |
| 528MHz PLL | pll2_sw_clk | | 528 | 528 |
| 480MHz PLL | pll3_sw_clk | | 480 | 480 |
| ARM core clock | arm_clk_root | System PLL | 792 | 396 |
| EIM | emi_slow_clk_root | 528MHz PLL | 132 | 132 |
| AHB | ahb_clk_root | 528MHz PLL/PFD352 | 132 | 88 |
| IPG | ipg_clk_root | 528MHz PLL/PFD352 | 66 | 44 |
| AXI_A | axi_a | 528MHz PLL/PFD352 | 528 | 352 |
| AXI_B | axi_b | 528MHz PLL/PFD352 | 264 | 176 |
| USB | usboh3_clk_root | 480MHz PLL | 60 | 60 |
| USDHC | usdhc1_clk_root usdhc2_clk_root usdhc3_clk_root usdhc4_clk_root | PFD400 | 198 | 198 |
| ECSPI | ecspi_clk_root | 480MHz PLL | 60 | 60 |
| I2C | per_clk_root | 528MHz PLL | 66 | 38.3 |

Following reset, each ARM core has access to all peripherals. The ROM code will disable the clocks listed in the following table, except for the boot devices listed in the second column.

Table 8-6. List Of Disabled Clocks

| Clock Name | Enabled For Boot Device |
|--------------------|-------------------------|
| CCGR0_APBHDMA | |
| CCGR1_ECSP11 | ECSP11 |
| CCGR1_ECSP12 | ECSP12 |
| CCGR1_ECSP13 | ECSP13 |
| CCGR1_ECSP14 | ECSP14 |
| CCGR1_FEC | |
| CCGR1_EPIT1 | |
| CCGR1_EPIT2 | |
| CCGR2_I2C1_SERIAL | I2C1 |
| CCGR2_I2C2_SERIAL | I2C2 |
| CCGR2_I2C3_SERIAL | I2C3 |
| CCGR3_OPENVGAXICLK | |
| CCGR4_PWM1 | |
| CCGR4_PWM2 | |
| CCGR4_PWM3 | |
| CCGR4_PWM4 | |
| CCGR5_SDMA | |
| CCGR5_SPDIF | |
| CCGR5_SSI1 | |
| CCGR5_SSI2 | |
| CCGR5_SSI3 | |
| CCGR5_UART | |
| CCGR5_UART_SERIAL | |
| CCGR6_USBOH3 | USB |
| CCGR6_USDHC1 | USDHC1 |
| CCGR6_USDHC2 | USDHC2 |
| CCGR6_USDHC3 | USDHC3 |
| CCGR6_USDHC4 | USDHC4 |
| CCGR6_EMI_SLOW | NOR, OneNAND |

8.4.4 Enabling MMU and Caches

The boot ROM includes a feature of enabling the Memory Management Unit (MMU) and caches to improve boot speed when performing a secure boot with SEC_CONFIG=Closed ([High Assurance Boot \(HAB\)](#)). L1 instruction cache is enabled at the start of image download. L1 data cache, L2 cache and MMU are enabled during image authentication. Once HAB authentication completes the ROM disables the L2 cache and MMU.

L1 Instruction cache is controlled by L1 I-Cache eFuse. By default the L1 I-Cache is enabled.

Enabling the MMU when booting non-securely with SEC_CONFIG=Open, and setting the CSF pointer in the Image Vector Table to NULL, has no impact on the boot performance. With this configuration it is recommended to blow BT_MMU_DISABLE fuse.

8.4.5 Exception Handling

The exception vectors located at the start of ROM are used to map all the ARM exceptions (except the reset exception) to a duplicate exception vector table in internal RAM.

During the boot phase of CPU0, the RAM vectors point to the serial downloader in ROM.

During the boot phase of a secondary CPU, the internal RAM vectors point to a function that sets the error status registers (see [Persistent Bits](#)), sends a wakeup error interrupt and performs the Wait For Interrupt instruction. The interrupt service routine of primary CPU must reconfigure the system and reset the secondary CPU.

After boot the program image can overwrite the vectors as required. The code shown below is used to map the ROM exception vector table to the duplicate one in RAM.

Mapping ROM Exception Vector Table

```
;; Define linker area for ROM exception vector table

8.4.6 Interrupt Handling During Boot

No special interrupt handling routines are required during the boot process. Interrupts are disabled during boot ROM execution and may be enabled in a later boot stage.

8.4.7 Persistent Bits

Some modes of boot ROM require registers that keep their values after warm reset. SRC General Purpose registers are used for this purpose.

See the table below for persistent bits list and description.

Table 8-7. Persistent Bits

| Bit Name | Bit Location | Description |
|-------------------------|----------------|--|
| PERSIST_SECONDARY_BOOT | SRC_GPR10[30] | This bit identifies which image must be used - primary and secondary. Used only for boot modes that support redundant boot. |
| PERSIST_BLOCK_REWRITE | SRC_GPR10[29] | This bit is used as warning. It identifies that there are errors in NAND blocks that hold the application image. See NAND Flash for more details. |
| PERSISTENT_ENTRY0[31:0] | SRC_GPR1[31:0] | Holds entry function for CPU0 for waking-up from low power mode. |
| PERSISTENT_ARG0[31:0] | SRC_GPR2[31:0] | Holds argument of entry function for CPU0 for waking-up from low power mode. |
| PERSISTENT_ENTRY1[31:0] | SRC_GPR3[31:0] | Holds entry function for CPU1. |
| PERSISTENT_ARG1[31:0] | SRC_GPR4[31:0] | Holds argument of entry function for CPU1. |
| PERSISTENT_ENTRY2[31:0] | SRC_GPR5[31:0] | Holds entry function for CPU2 (i.MX 6Quad only). |
| PERSISTENT_ARG2[31:0] | SRC_GPR6[31:0] | Holds argument of entry function for CPU2 (i.MX 6Quad only). |
| PERSISTENT_ENTRY3[31:0] | SRC_GPR7[31:0] | Holds entry function for CPU3 (i.MX 6Quad only). |
| PERSISTENT_ARG3[31:0] | SRC_GPR8[31:0] | Holds argument of entry function for CPU3 (i.MX 6Quad only). |
| CPU3_ERROR_STATUS | SRC_GPR10[27] | CPU3 error status bit (i.MX 6Quad only) |
| CPU2_ERROR_STATUS | SRC_GPR10[26] | CPU2 error status bit (i.MX 6Quad only) |
| CPU1_ERROR_STATUS | SRC_GPR10[25] | CPU1 error status bit |

8.5 Boot Devices (Internal Boot)

The Chip supports the following boot Flash devices:

- NOR Flash with External Interface Module (EIM), located on CS0, 16-bits and 32-bit bus width
- OneNAND Flash with EIM interface, located on CS0, 16-bits bus width
- Raw NAND (MLC and SLC), and Toggle-mode NAND flash through GPMI-2 interface. Page sizes of 2 Kbyte, 4 Kbyte and 8 Kbyte. Bus widths of 8-bit with 2 through 40-bit BCH Hardware ECC (Error Correction) are supported.
- SD/MMC/eSD/SDXC/eMMC4.4 via USDHC interface, supporting high capacity cards
- EEPROM boot via SPI (serial flash) and I2C (via ECSPI and I2C blocks respectively)
- Serial ATA (SATA) boot via SATA interface

The selection of external boot device type is controlled by BOOT_CFG1[7:4] eFUSES. See the table below for more details.

Table 8-8. Boot Device Selection

| BOOT_CFG1[7:4] | Boot Device |
|----------------|-------------------------|
| 0000 | NOR/OneNAND (EIM) |
| 0001 | Reserved |
| 0010 | SSD/Hard Disk (SATA) |
| 0011 | Serial ROM (I2C/SPI) |
| 010x | SD/eSD/SDXC |
| 011x | MMC/eMMC |
| 1xxx | NAND |

8.5.1 NOR Flash/OneNAND using EIM Interface

The External Interface Module (EIM) works in the asynchronous mode, and supports either muxed, Address/Data, or non-muxed schemes based on fuse settings.

Table 8-9. EIM Boot eFUSE Descriptions

| Fuse | Config | Definition | GPIO ¹ | Shipped Value | Settings |
|----------------|--------|-----------------------|-------------------|---------------|--|
| BOOT_CFG1[7:4] | OEM | Boot Device Selection | Yes | 0000 | 0000 - Boot from EIM Interface |
| BOOT_CFG1[3] | OEM | NOR/OneNAND Selection | Yes | 0 | 0 - NOR 1 - OneNAND |
| BOOT_CFG2[7:6] | OEM | Muxing Scheme | Yes | 00 | 00 - Muxed, 16-bit data (low half) interface 01 - Not muxed, 16-bit data (high half) interface 10 - Not muxed, 16-bit data (low half) interface 11 - Reserved |
| BOOT_CFG2[5:4] | OEM | OneNAND Page Size | Yes | 00 | 00 - 1K 01 - 2K 10 - 4K 11 - Reserved |

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

8.5.1.1 NOR Flash Boot Operation

Bootting from the NOR Flash is supported via EIM interface. The ROM reads Image Vector Table and Boot Data structures to determine if the image can be executed directly from EIM address space or should be copied to other memory.

The start field of Boot Data Structure specifies the final location of the image (see [Image Vector Table and Boot Data](#)).

8.5.1.2 OneNAND Flash Boot Operation

At system power-up, the OneNAND device automatically copies an Initial Load Region of 1 Kbyte from the start of the flash array (sector 0 and sector 1, page 0, block 0) to its Boot RAM (OneNAND's internal RAM).

NOTE

The OneNAND boot RAM memory containing the Initial 1K Load Region must contain the IVT, DCD and the Boot Data structures.

Next, the ROM processes the DCD and then proceeds to copy the Program Image contents to the application destination pointer (located in the start entry of Boot Data (see [Image Vector Table and Boot Data](#)). The ROM determines the size of the Program Image by the length specified by size entry in Boot Data structure (see [Image Vector Table and Boot Data](#)). A failure loading data from the OneNAND device for any reason forces the Chip to enter the Serial Downloader, otherwise the booting from the OneNAND device continues.

The figure below illustrates the layout of the Program Image on a OneNAND boot device.

Figure 8-4. Program Image Layout on a OneNAND Flash Device

Prior to accessing the OneNAND device, the Chip waits approximately 500 μ s after Power On Reset. This delay is required for the OneNAND device to become ready. After this initial 500 μ s delay it can take an addition 70 μ s for the OneNAND device to load the Initial Load Region of 1 Kbyte into its boot RAM. The Chip polls the OneNAND device Interrupt Status Register to confirm that the first 1 Kbytes has been loaded to the OneNAND boot RAM before continuing with the boot flow.

8.5.1.3 IOMUX Configuration for EIM Devices

The EIM interface uses dedicated contacts on the IC.

The contacts assigned to the data signals used by EIM are shown in the table below.

Table 8-10. EIM IOMUX Pin Configuration

| Signal | A/D16 (Muxed, 16-bit data low half interface) | A+DH (Not muxed, 16-bit data high half interface) | A+DL (Not muxed, 16-bit data low half interface) |
|--------|--|--|---|
| DATA0 | EIM_DA0.alt0 | EIM_D16.alt0 | CSI0_DATA_EN.alt1 |
| DATA1 | EIM_DA1.alt0 | EIM_D17.alt0 | CSI0_VSYNC.alt1 |
| DATA2 | EIM_DA2.alt0 | EIM_D18.alt0 | CSI0_DAT4.alt1 |
| DATA3 | EIM_DA3.alt0 | EIM_D19.alt0 | CSI0_DAT5.alt1 |
| DATA4 | EIM_DA4.alt0 | EIM_D20.alt0 | CSI0_DAT6.alt1 |
| DATA5 | EIM_DA5.alt0 | EIM_D21.alt0 | CSI0_DAT7.alt1 |
| DATA6 | EIM_DA6.alt0 | EIM_D22.alt0 | CSI0_DAT8.alt1 |
| DATA7 | EIM_DA7.alt0 | EIM_D23.alt0 | CSI0_DAT9.alt1 |
| DATA8 | EIM_DA8.alt0 | EIM_D24.alt0 | CSI0_DAT12.alt1 |
| DATA9 | EIM_DA9.alt0 | EIM_D25.alt0 | CSI0_DAT13.alt1 |
| DATA10 | EIM_DA10.alt0 | EIM_D26.alt0 | CSI0_DAT14.alt1 |
| DATA11 | EIM_DA11.alt0 | EIM_D27.alt0 | CSI0_DAT15.alt1 |
| DATA12 | EIM_DA12.alt0 | EIM_D28.alt0 | CSI0_DAT16.alt1 |
| DATA13 | EIM_DA13.alt0 | EIM_D29.alt0 | CSI0_DAT17.alt1 |
| DATA14 | EIM_DA14.alt0 | EIM_D30.alt0 | CSI0_DAT18.alt1 |
| DATA15 | EIM_DA15.alt0 | EIM_D31.alt0 | CSI0_DAT19.alt1 |
| ADDR0 | EIM_DA0.alt0 | | |
| ADDR1 | EIM_DA1.alt0 | | |
| ADDR2 | EIM_DA2.alt0 | | |
| ADDR3 | EIM_DA3.alt0 | | |

| ADDR9 | EIM_DA9.alt0 | | |
| ADDR10 | EIM_DA10.alt0 | | |
| ADDR11 | EIM_DA11.alt0 | | |
| ADDR12 | EIM_DA12.alt0 | | |
| ADDR13 | EIM_DA13.alt0 | | |
| ADDR14 | EIM_DA14.alt0 | | |
| ADDR15 | EIM_DA15.alt0 | | |

8.5.2 NAND Flash

The boot ROM supports a number of MLC/SLC NAND Flash devices from different vendors and LBA NAND Flash devices. The Error Correction and Control (ECC) subblock (BCH40) is used to detect the errors.

8.5.2.1 NAND eFUSE Configuration

The boot ROM determines the configuration of external the NAND flash by parameters, either provided by eFUSE, or sampled on GPIO pins, during boot.

See the table below for parameters details.

Table 8-11. NAND Boot eFUSE Descriptions

| Fuse | Config | Definition | GPIO ¹ | Shipped Value | Settings |
|----------------|--------|--|-------------------|---------------|--|
| BOOT_CFG1[7] | OEM | Boot Device Selection | Yes | 0 | 1 - Boot from NAND Interface |
| BOOT_CFG1[5] | OEM | BT_TOGGLEMODE | Yes | 0 | 0 - raw NAND 1 - toggle mode NAND |
| BOOT_CFG1[4] | OEM | Override Pad Settings | Yes | 0 | 0 - Use default values 1 - Use PAD_SETTINGS values |
| BOOT_CFG1[3:2] | OEM | Number of devices | Yes | 00 | 00 - 1 device 01 - 2 device 10 - 4 device 11 - Reserved |
| BOOT_CFG1[1:0] | OEM | Address Cycles | Yes | 00 | 00 - 3 01 - 2 10 - 4 11 - 5 |
| BOOT_CFG2[7:5] | OEM | Toggle Mode 33MHz Preamble Delay, Read Latency | Yes | 000 | 000 - 16 GPMICLK cycles. 001 - 1 GPMICLK cycles 010 - 2 GPMICLK cycles 011 - 3 GPMICLK cycles 100 - 4 GPMICLK cycles 101 - 5 GPMICLK cycles 110 - 6 GPMICLK cycles 111 - 7 GPMICLK cycles |
| BOOT_CFG2[4:3] | OEM | Boot Search Count | Yes | 00 | 00 - 2 01 - 2 10 - 4 11 - 8 |

Table continues on the next page...

**Table 8-11. NAND Boot eFUSE Descriptions
(continued)**

| Fuse | Config | Definition | GPIO ¹ | Shipped Value | Settings |
|----------------|--------|----------------|-------------------|---------------|--|
| BOOT_CFG2[2:1] | OEM | Pages In Block | Yes | 00 | 00 - 128 01 - 64 10 - 32 11 - 256 |
| BOOT_CFG2[0] | OEM | Reset time | Yes | 0 | 0 - 12ms 1 - 22ms (LBA NAND) |

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

8.5.2.2 NAND Flash Boot Flow and Boot Control Blocks (BCB)

There are two BCB data structures: FCB and DBBT.

As part of the NAND media initialization, the ROM driver uses safe NAND timings to search for a Firmware Configuration Block (FCB) that contains the optimum NAND timings, page address of Discovered Bad Block Table (DBBT) Search Area and start page address of primary and secondary firmware.

The hardware ECC level to use is embedded inside FCB block. The FCB data structure is protected using software ECC (SEC-DED Hamming Codes). Driver reads raw 2112 bytes of first sector and runs through software ECC engine that determines whether FCB data is valid or not.

If the FCB is found, the optimum NAND timings are loaded for further reads. If the ECC fails, or the fingerprints do not match, the Block Search state machine increments page number to Search Stride number of pages to read for the next BCB until SearchCount pages have been read.

If search fails to find a valid FCB, the NAND driver responds with an error and the boot ROM enters into serial download mode.

The FCB contains the page address of DBBT Search Area, and the page address for primary and secondary boot images. DBBT is searched in DBBT Search Area just like how FCB is searched. After the FCB is read, the DBBT is loaded, and the primary or secondary boot image is loaded using starting page address from FCB.

The state diagram of FCB search is shown in the following figure.

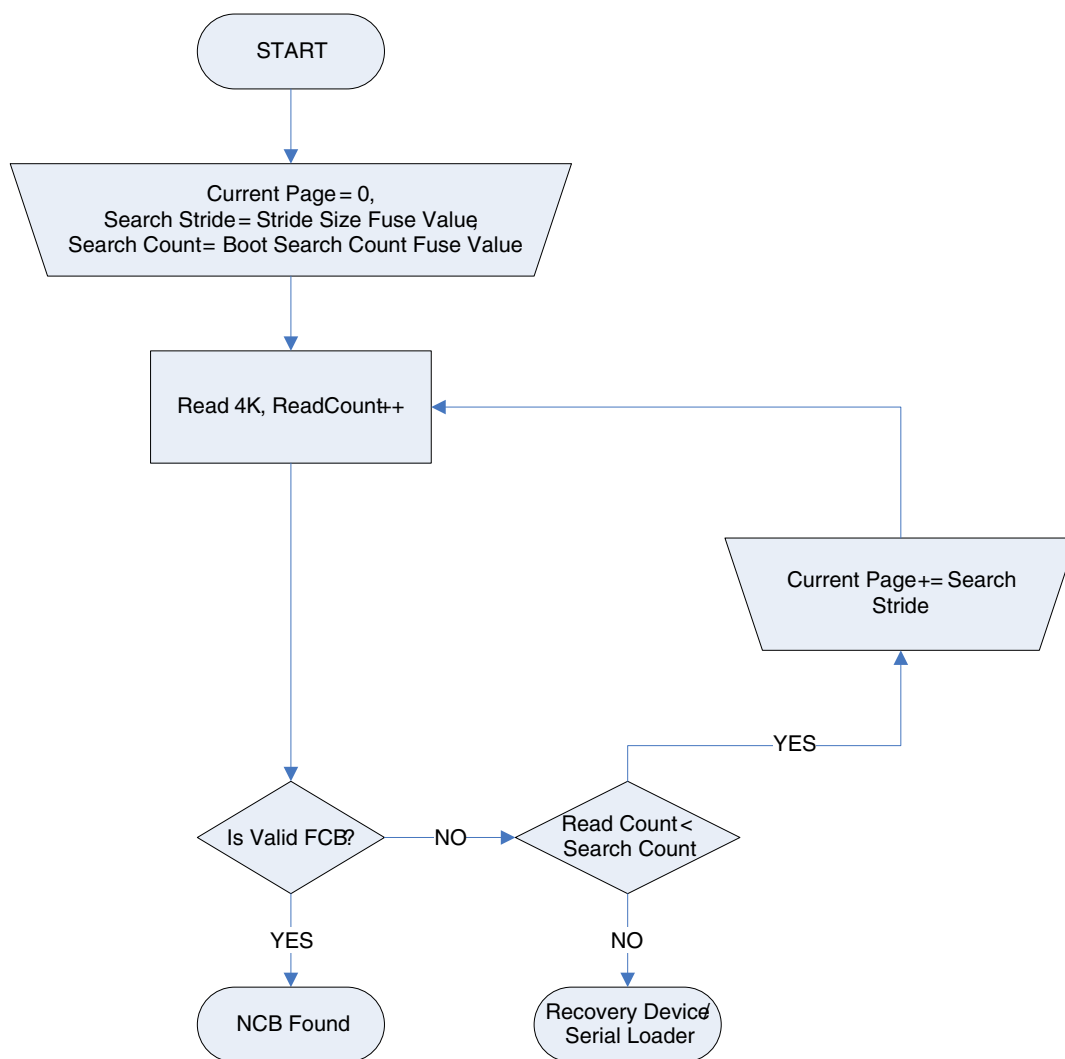

Figure 8-5. FCB Search Flow

Once FCB is found, the boot ROM searches for the Discovered Bad Blocks Table (DBBT). If DBBT Search Area is 0 in FCB, then ROM assumes that there are no bad blocks on NAND device. See the figure below for the DBBT search flow.

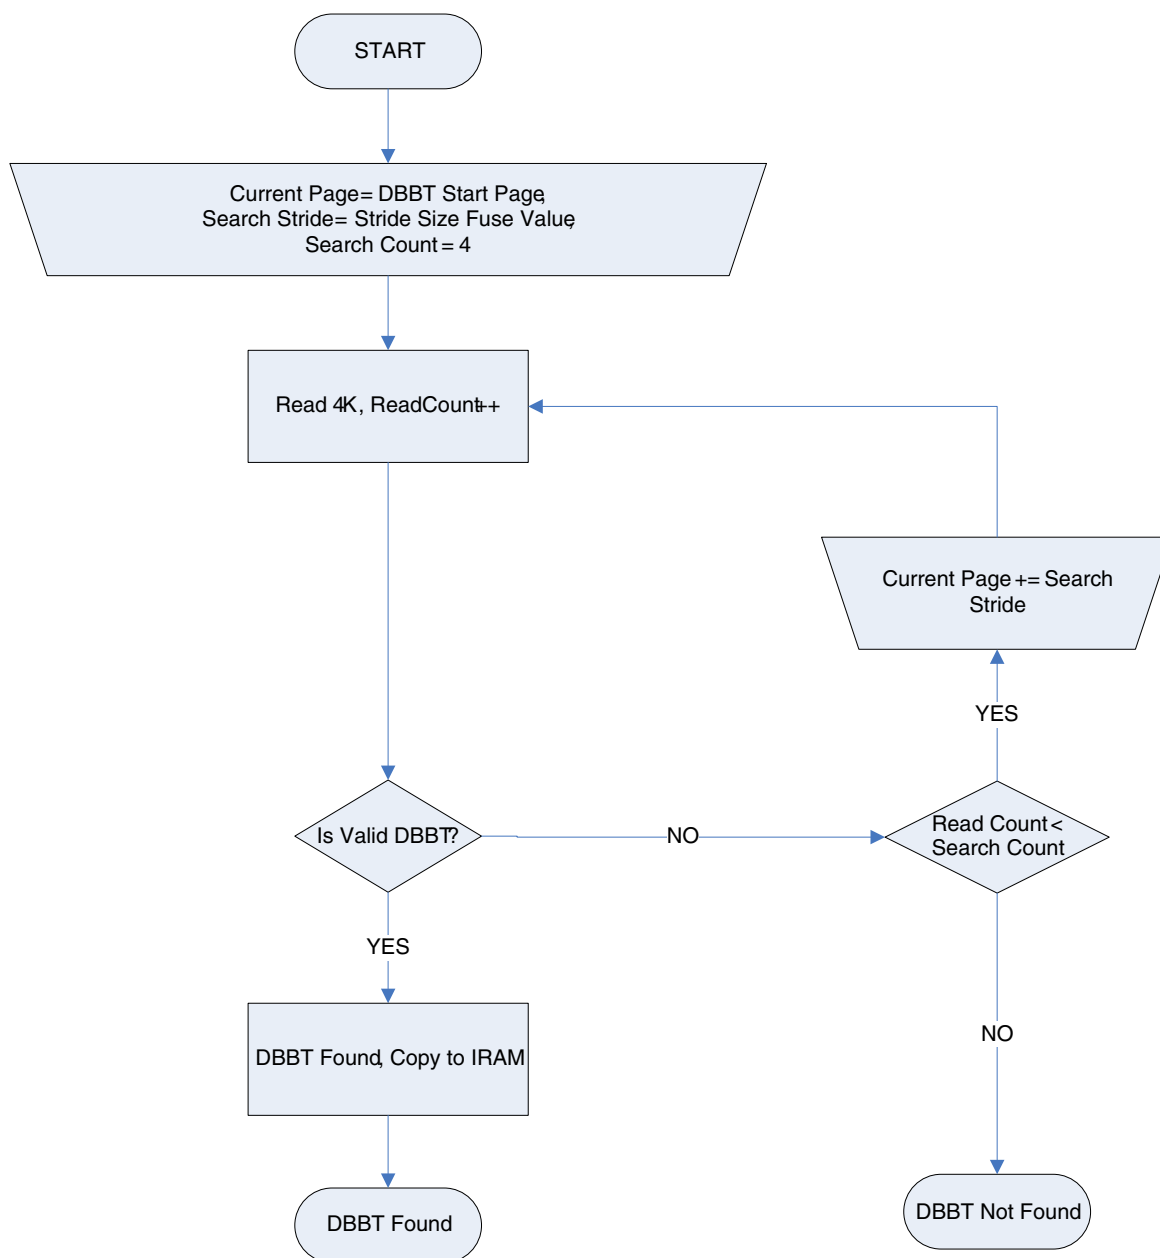

Figure 8-6. DBBT Search Flow

The BCB search and load function also monitors the ECC correction threshold and sets the `PERSIST_BLOCK_REWRITE` persistent bit if the threshold exceeds the maximum ECC correction ability.

If during primary image read there is a page with a number of errors higher than ECC can correct, the boot ROM will turn on `PERSIST_SECONDARY_BOOT` bit and perform SW reset. (After SW reset, secondary image will be used.)

If during secondary image read there is a page with number of errors higher than ECC can correct, the boot ROM will go to serial loader.

8.5.2.3 Firmware Configuration Block

The FCB is the first sector in the first good block. The FCB should be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, so in case the first NAND block becomes corrupted, the ROM will find its copy in the next NAND block. The search area should span over at least two NAND blocks. The location information for DBBT search area, FW1, and FW2 are all specified in the FCB. Flash Control Block Structure is as shown in the table below.

Table 8-12. Flash Control Block Structure

| Name | Start Byte | Size in Bytes | Description |
|-----------------|------------|---------------|--|
| Reserved | 0 | 4 | Reserved for Fingerprint #1(Checksum) |
| FingerPrint | 4 | 4 | 32 bit word with a value of 0x4E434220, in ascii "FCB" |
| Version | 8 | 4 | 32-bit version number; this version of FCB is 0x00000001 |
| m_NANDTiming | 12 | 8 | 8 bytes of data for 8 NAND Timing Parameters from NAND datasheet. The 8 parameters are: m_NandTiming[0]=data_setup, m_NandTiming[1]=data_hold, m_NandTiming[2]=address_setup, m_NandTiming[3]=dsample_time, m_NandTiming[4]=nand_timing_state, m_NandTiming[5]=REA, m_NandTiming[6]=RLOH, m_NandTiming[7]=RHOH. ROM only uses first 4 parameters but FCB provides space for other 4 parameters to be used by boot-loader or other applications. |
| PageDataSize | 20 | 4 | Number of bytes of data in a page. Typically, this is 2048 bytes for 2112 bytes page size or 4096 bytes for 4314/4224 bytes page size or 8192 for 8568 bytes page size |
| TotalPageSize | 24 | 4 | Total number of bytes in page. Typically, 2112 for 2 KB page or 4224 or 4314 for 4 KB page or 8568 for 8 KB page. |
| SectorsPerBlock | 28 | 4 | Number of pages per block. Typically 64 or 128 or depending on NAND device type. |

Table continues on the next page...

**Table 8-12. Flash Control Block Structure
(continued)**

| Name | Start Byte | Size in Bytes | Description |
|----------------------------|------------|---------------|---|
| NumberOfNANDs | 32 | 4 | Not used by ROM |
| TotalInternalDie | 36 | 4 | Not used by ROM |
| CellType | 40 | 4 | Not used by ROM |
| EccBlockNEccType | 44 | 4 | Value from 0 to 16 used to set BCH Error Correction level 0, 2, 4, .. or 40 for Block BN of ECC page, used in configuring BCH40 page layout registers |
| EccBlock0Size | 48 | 4 | Size of block B0, used in configuring BCH40 page layout registers |
| EccBlockNSize | 52 | 4 | Size of block BN, used in configuring BCH40 page layout registers |
| EccBlock0EccType | 56 | 4 | Value from 0 to 16 used to set BCH Error Correction level 0, 2, 4, .. or 40 for Block BN of ECC page, used in configuring BCH40 page layout registers |
| MetadataBytes | 60 | 4 | Size of metadata bytes used in configuring BCH40 page layout registers |
| NumEccBlocksPerPage | 64 | 4 | Number of ECC blocks BN not including B0. This value is used in configuring BCH40 page layout registers |
| EccBlockNEccLevelSDK | 68 | 4 | Not used by ROM |
| EccBlock0SizeSDK | 72 | 4 | Not used by ROM |
| EccBlockNSizeSDK | 76 | 4 | Not used by ROM |
| EccBlock0EccLevelSDK | 80 | 4 | Not used by ROM |
| NumEccBlocksPerPageSDK | 84 | 4 | Not used by ROM |
| MetadataBytesSDK | 88 | 4 | Not used by ROM |
| EraseThreshold | 92 | 4 | Not used by ROM |
| Firmware1_startingPage | 104 | 4 | Page number address where first copy of bootable firmware is located |
| Firmware2_startingPage | 108 | 4 | Page number address where second copy of bootable firmware is located |
| PagesInFirmware1 | 112 | 4 | Size of first copy of firmware in pages |
| PagesInFirmware2 | 116 | 4 | Size of second copy of firmware in pages |
| DBBTSearchAreaStartAddress | 120 | 4 | Page address for bad block table search area |
| BadBlockMarkerByte | 124 | 4 | This is an input offset in BCH page for ROM to swap with first byte of metadata after reading a page using BCH40. ROM supports restoration of manufacturer marked bad block markers in the page and this offset is the bad block marker offset location |
| BadBlockMarkerStartBit | 128 | 4 | This is an input bit offset in BadBlockMarkerByte for ROM to use when swapping 8 bits with first byte of metadata. |
| BBMarkerPhysicalOffset | 132 | 4 | This is the offset where manufacturer leaves bad block marker on a page |

Table continues on the next page...

**Table 8-12. Flash Control Block Structure
(continued)**

| Name | Start Byte | Size in Bytes | Description |
|--------------------------|------------|---------------|---|
| BCHType | 136 | 4 | 0 for BCH20 and 1 for BCH40. The Chip is backward compatible to BCH20 and this field tell ROM to use BCH20 or BCH40 block |
| TMTiming2_ReadLatency | 140 | 4 | Toggle mode NAND timing parameter read latency, ROM use this value to configure timing2 register of GPMI |
| TMTiming2_PreambleDelay | 144 | 4 | Toggle mode NAND timing parameter Preamble Delay. ROM use this value to configure timing2 register of GPMI |
| TMTiming2_CEDelay | 148 | 4 | Toggle mode NAND timing parameter CE Delay. ROM use this value to configure timing2 register of GPMI |
| TMTiming2_PostambleDelay | 152 | 4 | Toggle mode NAND timing parameter Postamble Delay. ROM use this value to configure timing2 register of GPMI |
| TMTiming2_CmdAddPause | 156 | 4 | Toggle mode NAND timing parameter Cmd Add Pause. ROM use this value to configure timing2 register of GPMI |
| TMTiming2_DataPause | 160 | 4 | Toggle mode NAND timing parameter Data Pause. ROM use this value to configure timing2 register of GPMI |
| TMSpeed | 164 | 4 | This is the toggle mode speed for ROM to configure gpmi clock. 0 for 33 MHz, 1 for 40 MHz and 2 for 66 MHz |
| TMTiming1_BusyTimeout | 168 | 4 | Toggle mode NAND timing parameter Busy Timeout. ROM use this value to configure timing1 register of GPMI |
| DISBBM | 172 | 4 | If 0 ROM will swap BadBlockMarkerByte with metadata[0] after reading a page using BCH40. If the value set is 1 then ROM will not do swapping |
| BBMark_spare_offset | 176 | 4 | The offset in mata data place which stores the data in Bad block marker place. |
| Onfi_sync_enable | 180 | 4 | Enable the Onfi nand sync mode support |
| Onfi_sync_speed | 184 | 4 | Speed for onfi nand sync mode: 0 - 24MHZ, 1 - 33MHZ, 2 - 40MHZ, 3 - 50MHZ, 4 - 66MHZ, 5 - 80MHZ, 6 - 100MHZ, 7 - 133MHZ, 8 - 160MHZ, 9 - 200MHZ |
| Onfi_syncNANDData | 188 | 28 | parameters for onfi nand sync mode timing. They are read_latency, ce_delay, preamble_delay, postamble_delay, cmdadd_pause, data_pause, busy_timeout |
| DISBB_Search | 216 | 4 | Disable the badblock search function when reading the firmware, only using DBBT. |

8.5.2.4 Discovered Bad Block Table

See the table below for DBBT format.

Table 8-13. DBBT Structure

| Name | Start Byte | Size in Bytes | Description |
|-----------------------|-----------------|---------------|---|
| reserved | 0 | 4 | - |
| FingerPrint | 4 | 4 | 32-bit word with a value of 0x44424254, in ascii "DBBT" |
| Version | 8 | 4 | 32-bit version number; this version of DBBT is 0x00000001 |
| reserved | 12 | 4 | - |
| DBBT_NUM_OF_PAGES | 16 | 4 | Size of DBBT in pages |
| reserved | 20 | 4*PageSize-20 | - |
| reserved | 4*PageSize | 4 | - |
| Number of Entries | 4*PageSize + 4 | 4 | Number of bad blocks |
| Bad Block Number | 4*PageSize + 8 | 4 | First bad block number |
| Bad Block Number | 4*PageSize + 12 | 4 | Second bad block number |
| ...- | - | - | ...next bad block number |
| ...- | - | - | ...- |
| Last bad block number | - | - | last bad block number |

8.5.2.5 Bad Block Handling in the ROM

During firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block checked.

If Bad Block table start page is null, check the manufactory made Bad Block marker. The location of Bad Block maker is at the first 3 or last 3 pages in every block of the NAND flash. NAND manufacturers normally use one byte in the spare area of certain pages within a block to mark a block is bad or not. 0xFF means good block, non FF means bad block.

In order to preserve the BI (bad block information), flash updater or gang programmer applications need to swap Bad Block Information (BI) data to byte 0 of metadata area for every page before programming NAND flash. ROM when loading firmware copies back the value at metadata[0] to BI offset in page data. The figure below shows how the factory bad block marker is preserved.

Bad block information at
column address 2048

Figure 8-7. Factory Bad Block Marker Preservation

In the FCB structure, there are two elements `m_u32BadBlockMarkerByte` and `m_u32BadBlockMarkerStartBit` to indicate the byte and bit place in the page data, that manufacturer marked the bad block marker.

8.5.2.6 Toggle Mode DDR NAND Boot

If `BT_TOGGLEMODE` efuse is blown then ROM does the following to boot from Samsung's toggle mode DDR NAND.

8.5.2.6.1 GPMI and BCH Clocks Configuration

ROM sets the clock source and the dividers in CCM registers. If `BOOT_CFG1` [5] is set (toggle mode), GPMI/BCH CLK source is PLL2PFD4, and running at 66MHz, otherwise GPMI/ BCH CLK source is PLL3, running at 24 Mhz. ROM sets default values to `timing0`, `timing1` and `timing2` gpmi registers for 24 MHz clock speed.

It uses fuse `BOOT_CFG2`[7:5] to configure GPMI `timing2` register parameters preamble delay and read latency, the default value for these parameters is 2 when fuses are not blown.

Default timing parameter values used by ROM for toggle-mode device:

- `Timing0.ADDRESS_SETUP = 5`

- Timing0.DATA_SETUP = 10
- Timing0.DATA_HOLD = 10
- Timing1.DEVICE_BUSY_TIMEOUT = 0 x 500
- Timing2.READ_LATENCY = BOOT_CFG2[7:5] if blown, otherwise 2
- Timing2.CE_DELAY = 2
- Timing2.PREAMBLE_DELAY = BOOT_CFG2[7:5] if blown, otherwise 2
- Timing2.POSTAMBLE_DELAY = 3
- Timing2.CMDADD_PAUSE = 4
- Timing2.DATA_PAUSE = 6

Default timing parameters can be overridden by TMTiming2_ReadLatency, TMTiming2_PreambleDelay, TMTiming2_CEDelay, TMTiming2_PostambleDelay, TMTiming2_CmdAddPause, TMTiming2_DataPause parameters of FCB.

8.5.2.6.2 Setup DMA for DDR Transfers

In DMA descriptors GPMI is configured to read page data at double data rate, the word length is set to 16 and transfer count to half of page size.

8.5.2.6.3 Reconfigure Timing and Speed Using Values in FCB

After reading FCB page with GPMI set to default timings and speed 33 MHz, ROM reconfigures CCM dividers to run gpmi/bch clks to desired speed specified in FCB for rest of boot process. The GPMI timing registers are also reconfigured to values specified in FCB.

The GPMI speed can be configured using FCB parameter TMSpeed: 0 - 24MHZ, 1 - 33MHZ, 2 - 40MHZ, 3 - 50MHZ, 4 - 66MHZ, 5 - 80MHZ, 6 - 100MHZ, 7 - 133MHZ, 8 - 160MHZ, 9 - 200MHZ.

The GPMI timing0 register fields data_setup, data_hold and address_setup are set to values specified for data_setup, data_hold and address_setup in FCB member m_NANDTiming.

The GPMI timing1.DEVICE_BUSY_TIMEOUT is set to value specified in FCB member TMTiming1_BusyTimeout.

The GPMI timing2 register values are set using FCB members TMTiming2.READ_LATENCY, CE_DELAY, PREAMBLE_DELAY, POSTAMBLE_DELAY, CMDADD_PAUSE and DATA_PAUSE.

8.5.2.7 Typical NAND Page Organization

8.5.2.7.1 BCH ECC Page Organization

The first data block is called block 0 and the rest of the blocks are called block N. Separate ECC level can be used for block 0 and block N.

The metadata bytes should be located at the beginning of a page, starting at byte 0, followed by data block 0, followed by ECC bytes for data block 0, followed by block 1 and its ECC bytes, and so on until N data blocks. The ECC level for block 0 can be different from the ECC level of rest of the blocks.

For NAND boot, with page size restrictions and data block size restricted to 512 bytes, only few combinations of ECC for block 0 and block N are possible.

The figure below shows the valid layout for 2112 byte sized page.

Figure 8-8. Valid Layout for 2112 bytes Sized Page

The example below is for 13 bits of parity(GF13). The number of ECC bits required for a data block is calculated using (ECC_Correction_Level * 13) bits.

In the above layout the ECC size for EccB0 and EccBN should be selected to not exceed a total page size of 2112 bytes. EccB0 and EccBN can be one of 2, 4, 6, 8, 10, 12, 14, 16, 18, 20 bits ECC correction level. The total bytes would then be:

$$[M + (\text{data_block_size} \times 4) + ([\text{EccB0} + (\text{EccBN} \times 3)] \times 13) / 8] \leq 2112;$$

M = metadata bytes and data_block_size is 512.

There are 4 data blocks of 512 bytes each in a page of 2k page sized NAND. The values of EccB0 and EccBN should be such that the above calculation would not result in a value greater than 2112 bytes.

| | | | | | | | | |
|---|---------------------|-------|---------------------|-------|---------------------|-------|---------------------|-------|
| M | Block0 512 bytes | EccB0 | Block1 512 bytes | EccBN | Block2 512 bytes | EccBN | Block3 512 bytes | EccBN |
| | Block4 512 bytes | EccBN | Block5 512 bytes | EccBN | Block6 512 bytes | EccBN | Block7 512 bytes | EccBN |

Figure 8-9. Valid Layout for 4 Kbytes Sized Page

Different NAND manufacturers have different sizes for a 4K page; 4314 bytes is typical.

$[M + (\text{data_block_size} \times 8) + ([\text{EccB0} + (\text{EccBN} \times 7)] \times 13) / 8] \leq 4314;$

M= metadata bytes and data_block_size is 512.

There are 8 data blocks of 512 bytes each in a page of a 4k page sized NAND. The values of EccB0 and EccBN should be such that above calculation should not result in a value greater than the size of a page in a 4k page NAND.

8.5.2.7.2 Metadata

The number of bytes used for metadata is specified in FCB. Metadata for BCH encoded pages will be placed at the beginning of a page. ROM only cares about the first byte of metadata to swap it with bad block marker byte in page data after each page read; it is important to have at least one byte for the metadata bytes field in FCB data structure.

8.5.2.8 IOMUX Configuration for NAND

The table below shows the RawNAND IOMUX pin configuration.

Table 8-14. NAND IOMUX Pin Configuration

| Signal | Pad Name |
|--------|-----------------|
| CLE | NANDF_CLE.alt0 |
| ALE | NANDF_ALE.alt0 |
| WPN | NANDF_WP_B.alt0 |
| RD_N | SD4_CMD.alt1 |
| WRN | SD4_CLK.alt1 |
| READY0 | NANDF_RB0.alt0 |
| DQS | SD4_DAT0.alt2 |
| CE0N | NANDF_CS0.alt0 |
| CE1N | NANDF_CS1.alt0 |

Table continues on the next page...

Table 8-14. NAND IOMUX Pin Configuration (continued)

| | |
|------|----------------|
| CE2N | NANDF_CS2.alt0 |
| CE3N | NANDF_CS3.alt0 |
| D0 | NANDF_D0.alt0 |
| D1 | NANDF_D1.alt0 |
| D2 | NANDF_D2.alt0 |
| D3 | NANDF_D3.alt0 |

| D5 | NANDF_D5.alt0 |
| D6 | NANDF_D6.alt0 |
| D7 | NANDF_D7.alt0 |

8.5.3 Expansion Device

The ROM supports booting from MMC/eMMC and SD/eSD compliant devices.

8.5.3.1 Expansion Device eFUSE Configuration

SD/MMC/eSD/eMMC/SDXC boot can be performed using either USDHC-1, USDHC-2, USDHC-3, or USDHC-4 ports, based on setting of the BOOT_CFG2[4:3] (Port Select) fuse or it's associated GPIO input value at boot. All USDHC ports support eMMC4.3 and eMMC4.4 fast boot.

See the table below for details.

Table 8-15. USDHC Boot eFUSE Descriptions

| Fuse | Config | Definition | GPIO ¹ | Shipped Value | Settings |
|----------------|--------|-----------------------|-------------------|---------------|----------------------------------|
| BOOT_CFG1[7:6] | OEM | Boot Device Selection | Yes | 00 | 01 - Boot from USDHC Interfaces |
| BOOT_CFG1[5] | OEM | SD/MMC Selection | Yes | 0 | 0 - SD/eSD/SDXC 1 - MMC/eMMC |
| BOOT_CFG1[4] | OEM | Fast Boot Support | Yes | 0 | 0 - Normal Boot 1 - Fast Boot |

Table continues on the next page...

**Table 8-15. USDHC Boot eFUSE Descriptions

Table continues on the next page...

**Table 8-15. USDHC Boot eFUSE Descriptions
(continued)**

| Fuse | Config | Definition | GPIO ¹ | Shipped Value | Settings |
|------------------|--------|--|-------------------|---------------|--|
| BOOT_CFG2[4:3] | OEM | Port Select | Yes | 00 | 00 - USDHC-1 01 - USDHC-2 10 - USDHC-3 11 - USDHC-4 |
| BOOT_CFG2[2] | OEM | DLL Override (eMMC Only) | Yes | 0 | 0 - Boot ROM default. 1 - Apply value per fuse field MMC_DLL_DLY[6:0] |
| BOOT_CFG2[1] | OEM | Boot Acknowledge Disable / Pull-Down During Power Cycle Enable | Yes | 0 | MMC 0 - Boot Acknowledge Enabled. 1 - Boot Acknowledge Disabled. SD 0 - Use default SD pad settings during power cycle 1 - Set pull-down on SD pads during power cycle (used only if "SD Power Cycle Enable" enabled) |
| BOOT_CFG2[0] | OEM | Override Pad Settings | Yes | 0 | 0 - Use default values 1 - Use PAD_SETTINGS values |
| MMC_DLL_DLY[6:0] | OEM | MMC DLL Value / UHSI Calibration Start Value | No | 0000000 | MMC DLL Value / UHSI Calibration Start Value |

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

Boot code supports following standards.

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less
- eSDv2.10 rev-0.9, with or without FAST_BOOT.
- SDXCv3.0

MMC/SD/eSD/SDXC/eMMC can be connected to any of USDHC-1,2,3,4 blocks and can be booted by copying 4Kbyte of data from MMC/SD/eSD/eMMC device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

The maximum image size to load in SD/MMC boot is 32MB. This is due to the limited number of uSDHC ADMA Buffer Descriptors allocated by ROM.

NOTE

The Initial 4Kbyte of Program Image must contain the IVT, DCD and the Boot Data structures.

Table 8-16. SD/MMC Frequencies

| | SD | MMC | MMC (DDR Mode) |
|-------------------------|--------|-----|----------------|
| Identification (KHz) | 347.22 | | |
| Normal Speed Mode (MHz) | 25 | 20 | 25 |
| High Speed Mode (MHz) | 50 | 40 | 50 |
| UHSI SDR50 (MHz) | 100 | | |
| UHSI SDR104 (MHz) | 200 | | |

NOTE

The boot ROM code reads application image length and application destination pointer from image.

8.5.3.2 MMC and eMMC Boot

The following table provides MMC and eMMC boot details.

Table 8-17. MMC and eMMC Boot Details

| | |
|------------------|--|
| Normal Boot Mode | <p>During initialization (normal boot mode) the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, voltage validation is performed and the ROM boot code checks high voltage settings and card capacity. The ROM boot code supports both high capacity and low capacity MMC/eMMC cards. After initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in Normal boot mode or 40MHz in High Speed mode). eMMC is also interfaced via USDHC and follows the same flow as MMC.</p> <p>The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the BOOT_PARTITION_ENABLE field in the Ext_CSD[179] to get the boot partition to be set. If there is no boot partition mentioned in BOOT_PARTITION_ENABLE field or the user partition has been mentioned, ROM boots from the user partition.</p> |
|------------------|--|

Table continues on the next page...

Table 8-17. MMC and eMMC Boot Details (continued)

| | |
|--|---|
| eMMC4.3 or eMMC4.4 Device Supporting Special Boot Mode | If using an eMMC4.3 or eMMC4.4 device supporting special boot mode, it can be initiated by pulling the CMD line low. If BOOT ACK is enabled, the eMMC4.3/eMMC4.4 device sends the BOOT ACK via DATA lines and ROM can read the BOOT ACK [S010E] to identify the eMMC4.3/eMMC4.4 device. eMMC4.3/eMMC4.4 device with "Boot mode" feature can only be supported via ESDHCV3-3 and with or without BOOT ACK. If BOOT ACK is enabled ROM waits 50 ms to get the BOOT ACK and if BOOT ACK is received by ROM. If BOOT ACK is disabled ROM waits 1 second for data. If BOOT ACK or data was received then eMMC4.3/eMMC4.4 is booted in "Boot mode", otherwise eMMC4.3/eMMC4.4 boots as a normal MMC card from the selected boot partition. This boot mode can be selected by BOOT_CFG1[4] (Fast Boot) fuse. BOOT ACK is selected by BOOT_CFG2[1]. |
| eMMC4.4 Device | If using eMMC4.4 device, Double Data Rate (DDR) mode can be used. This mode can be selected by BOOT_CFG2[7:5] (Bus Width) fuse. |

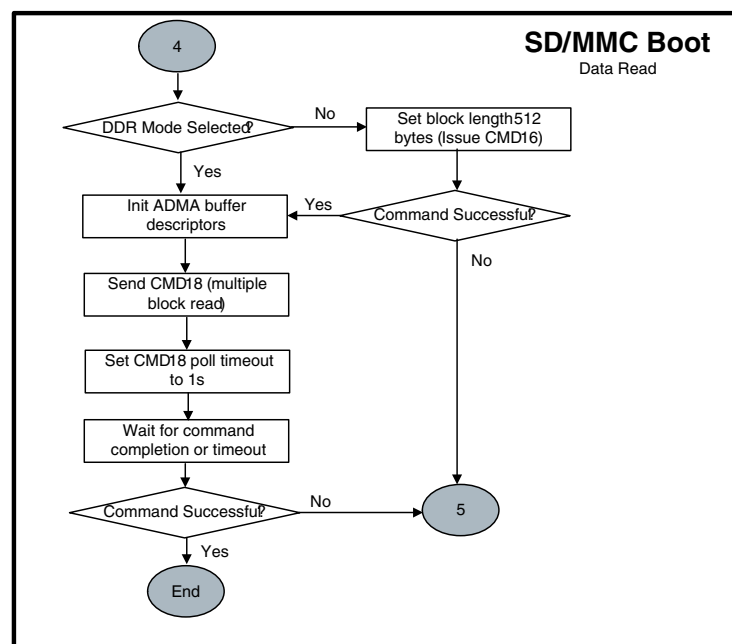

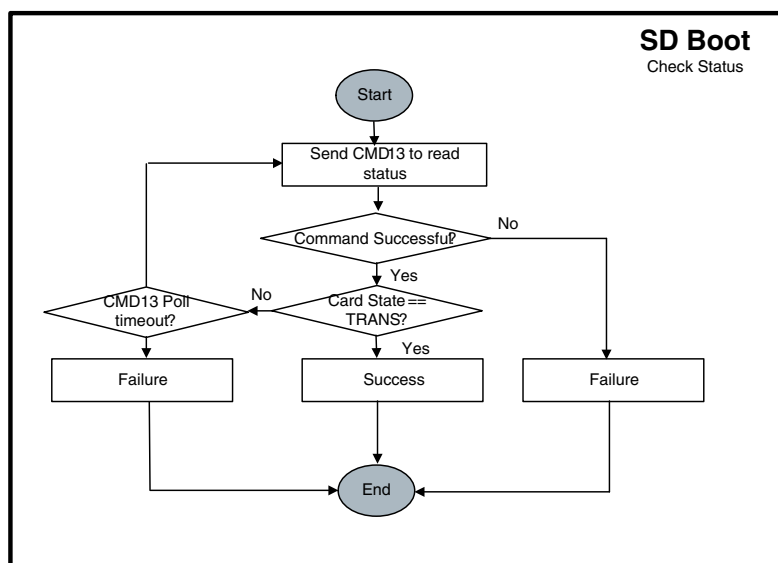

Figure 8-15. Expansion Device (SD/eSD) Boot Flow (5 of 6)

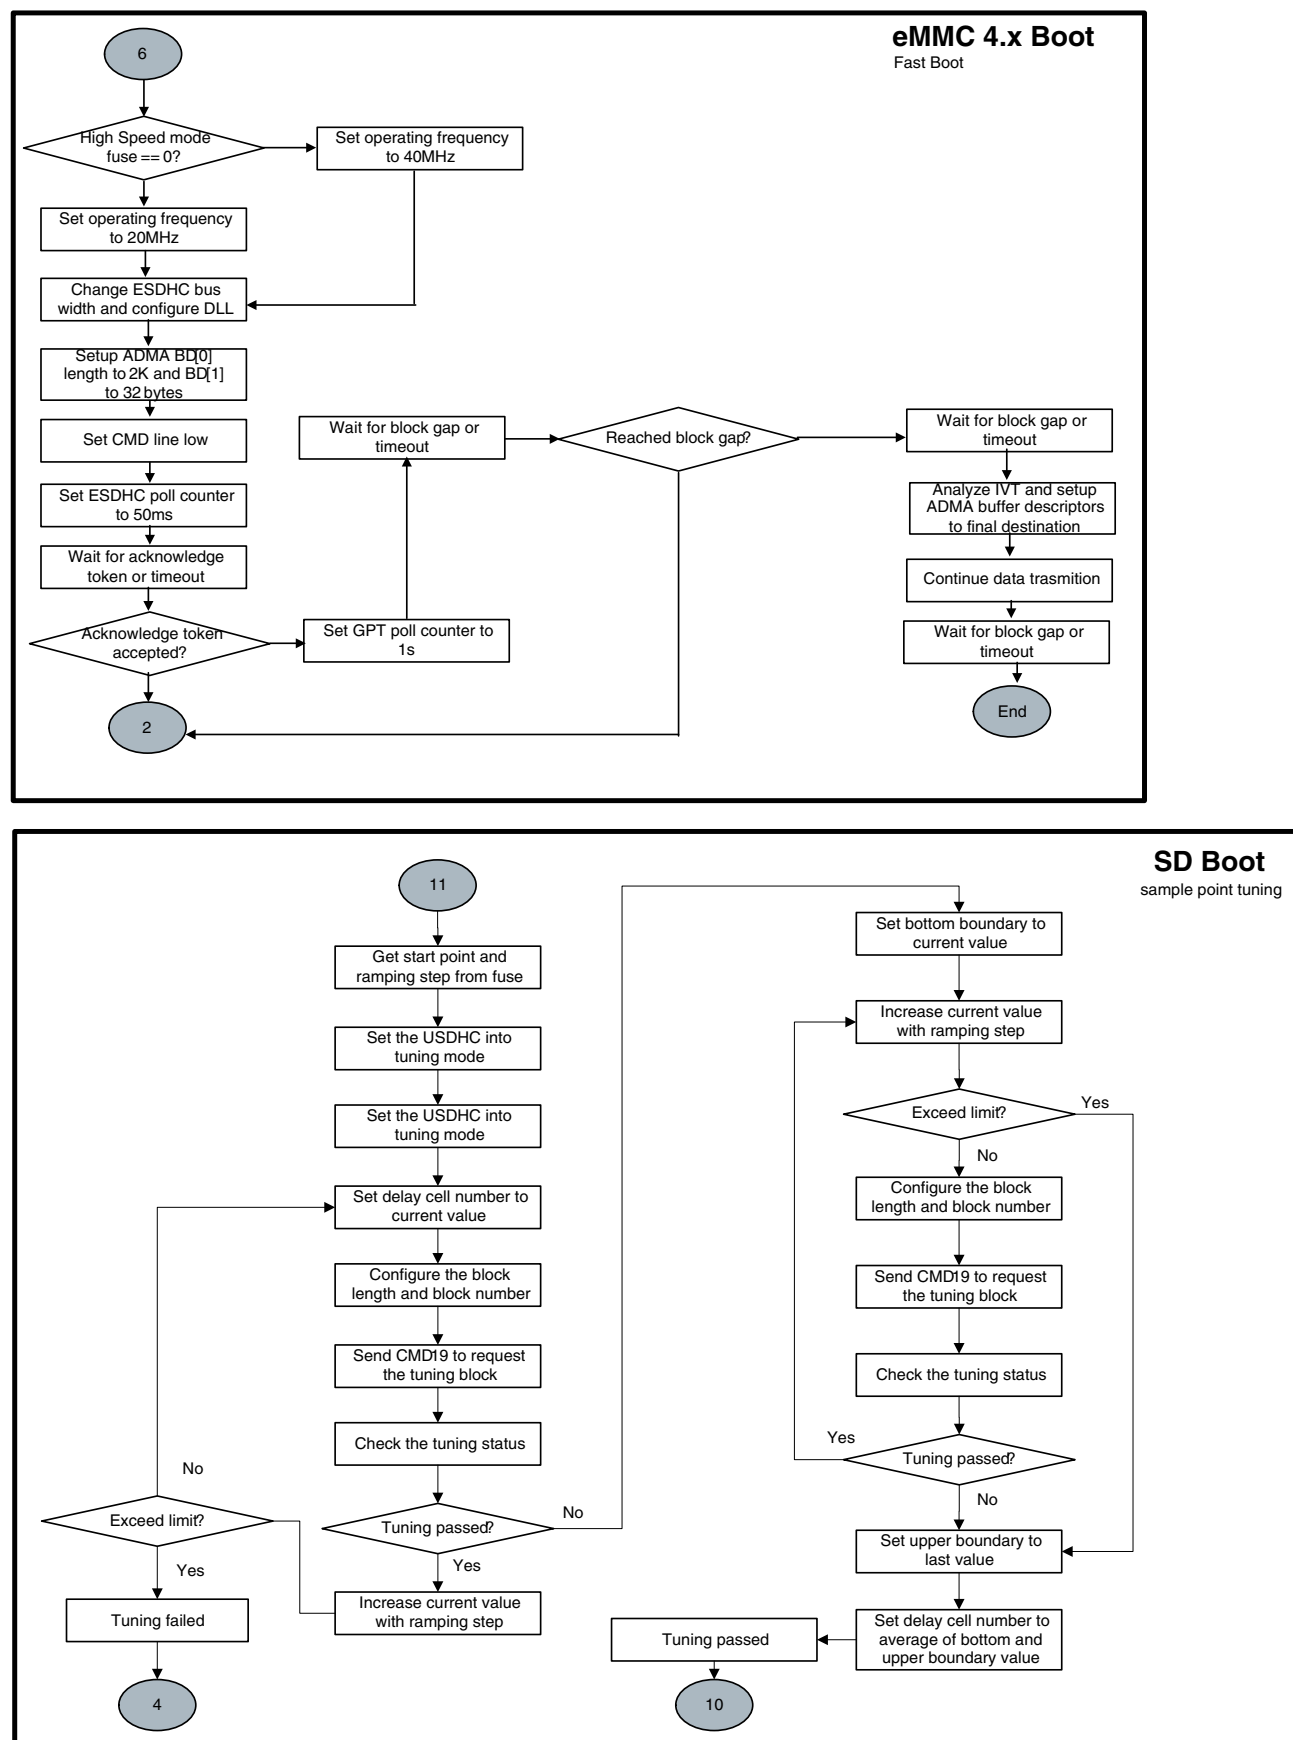

Figure 8-16. Expansion Device Boot Flow (6 of 6)
i.MX 6Dual/6Quad Applications Processor Reference Manual, Rev. 1, 04/2013

8.5.3.3 SD, eSD and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, SD/eSD/SDXC card voltage validation is performed. During voltage validation, boot code first checks with high voltage settings; if that fails, it checks with low voltage settings.

The capacity of the card is also checked. Boot code supports high capacity and low capacity SD/eSD/SDXC cards after voltage validation card initialization is done.

During card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes the card is a normal SD card or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, boot code switches to a higher frequency (25 MHz in Normal Speed mode or 50 MHz in High Speed Mode). ROM also supports FAST_BOOT mode booting from eSD card. This mode can be selected by BOOT_CFG1[4] (Fast Boot) fuse described in [Table 8-15](#).

For UHSI cards, clock speed fuses can be set to SDR50 or SDR104 on USDHC3 and USDHC4 ports. This will enable the voltage switch process to set the signaling voltage to 1.8V during voltage validation. The bus width is fixed at 4 bits wide and a sampling point tuning process is needed to calibrate the number of delay cells. If SD Loopback Clock eFuse is set, the feedback clock will come directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by BOOT_CFG1[3:2], and the SD Loopback Clock is selected by BOOT_CFG1[0].

UHSI calibration start value (MMC_DLL_DLY[6:0]) and step value (BOOT_CFG2[7:5]) can be set to optimize the sample point tuning process.

If SD Power Cycle Enable eFuse is 1, ROM will set SD_RST pad low, wait 5ms and then set SD_RST pad high. If SD_RST pad is connected to SD power supply enable logic on board, it enables power cycle of SD card. This may be crucial in case when SD logic is in 1.8V states and must be reset to 3.3V states.

8.5.3.4 IOMUX Configuration for SD/MMC

Table 8-18. SD/MMC IOMUX Pin Configuration

| Signal | USDHC-1 | USDHC-2 | USDHC-3 | USDHC-4 |
|-------------|---------------|---------------|---------------|---------------|
| CLK | SD1_CLK.alt0 | SD2_CLK.alt0 | SD3_CLK.alt0 | SD4_CLK.alt0 |
| CMD | SD1_CMD.alt0 | SD2_CMD.alt0 | SD3_CMD.alt0 | SD4_CMD.alt0 |

1. Active low

8.5.3.5 Redundant Boot Support for Expansion Device

ROM supports redundant boot for expansion device. Primary or Secondary image is selected depending on PERSIST_SECONDARY_BOOT setting (see [Table 8-7](#)).

If PERSIST_SECONDARY_BOOT is 0, the boot ROM uses address 0x0 for primary image.

If PERSIST_SECONDARY_BOOT is 1, the boot ROM will read secondary image table from address 0x200 on boot media and will use address specified in the table.

Table 8-19. Secondary Image Table Format

| |
|------------------------|
| Reserved (chipNum) |
| Reserved (driveType) |
| tag |
| firstSectorNumber |
| Reserved (sectorCount) |

Where:

- tag: used as indication of valid secondary image table. Must be 0x00112233.
- firstSectorNumber is the first 512B sector number of the secondary image.

For secondary image support, the primary image must reserve space for secondary image table. See the figure below for typical structures layout on expansion device.

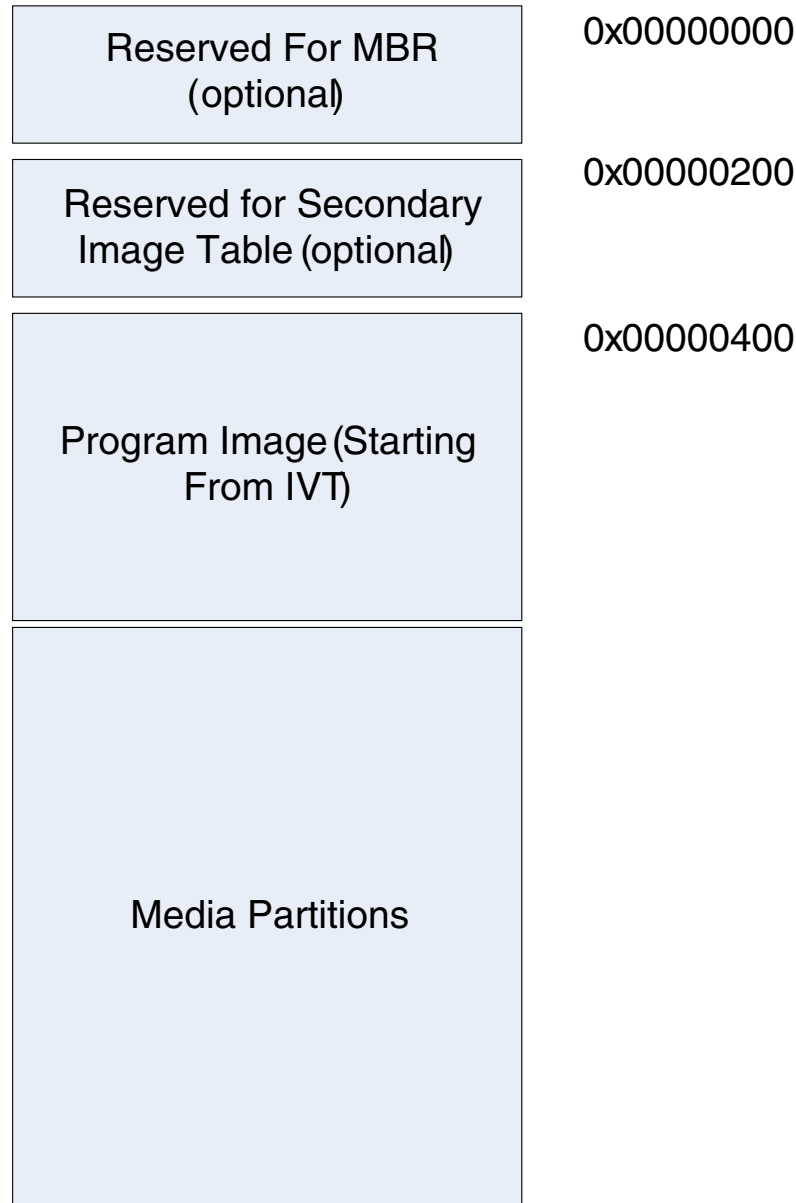

Figure 8-17. Expansion Device Structures Layout

For Closed mode, if there are failures during primary image authentication, the boot ROM will turn on PERSIST_SECONDARY_BOOT bit (see [Table 8-7](#)) and perform software reset. (After software reset, secondary image will be used.)

8.5.4 Hard Disk and SSD

The chip supports boot from Hard Disk and SSD devices using SATA interface.

8.5.4.1 Hard Disk and SSD eFUSE Configuration

The boot ROM code determines the type of device using the following parameters, either provided by eFUSE settings or sampled on the I/O pins, during boot.

Table 8-20. HDD eFUSE Descriptions

| Fuse | Config | Definition | GPIO ¹ | Shipped Value | Settings |
|----------------|--------|-----------------------|-------------------|---------------|--|
| BOOT_CFG1[7:4] | OEM | Boot Device Selection | Yes | 0000 | 0010 - Boot from Hard Disk |
| BOOT_CFG2[4] | OEM | Tx Spread Spectrum | Yes | 0 | 0 - Disabled 1 - Enabled |
| BOOT_CFG2[3] | OEM | Rx Spread Spectrum | Yes | 0 | 0 - Enabled 1 - Disabled |
| BOOT_CFG2[2] | OEM | SATA Speed | Yes | 0 | 0 - Gen2 (3.0Gbps) 1 - Gen1 (1.5Gbps) |
| BOOT_CFG2[1:0] | OEM | SATA Type | Yes | 00 | 00 - i (internal electrical specifications with cable length up to 1m, see Serial ATA specification) 01 - m (electrical specifications used in Short Backplane Application and External Desktop Application, see Serial ATA specification) 10 - x (external cabled applications or Long Backplane Applications, see Serial ATA specification) 11 - Reserved |

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

The boot ROM will send IDENTIFY command to hard disk during initialization. When identification block is received, boot ROM assumes that the device is ready. The boot ROM sends a separate command for each sector of 512 bytes in PIO mode.

The boot ROM will copy 4KB of data from Hard Disk or SSD device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts the destination pointer and length of image to be copied to RAM device from the Boot Data Structure, where code execution occurs.

NOTE

The Initial 4 KB of Program Image must contain the IVT, DCD and the Boot Data structures.

8.5.4.2 IOMUX and Timing Configuration for SATA

The interface signals of the SATA PHY are not configured in the IOMUX. The SATA PHY interface uses dedicated contacts on the IC. See the Chip data sheet for details.

ROM reads the TX Spread Spectrum, RX Spread Spectrum, Speed and Type of SATA and configures timing parameters via the IOMUX GPR register.

8.5.4.3 Redundant Boot Support for Hard Disk and SSD

ROM supports redundant boot for hard disk and SSD. Primary or Secondary image is selected depending on PERSIST_SECONDARY_BOOT setting (see [Table 8-7](#)).

If PERSIST_SECONDARY_BOOT is 0, the boot ROM uses address 0x0 for primary image.

If PERSIST_SECONDARY_BOOT is 1, the boot ROM will read secondary image table from address 0x200 on boot media and will use address specified in the table.

Table 8-21. Secondary Image Table Format

| |
|------------------------|
| Reserved (chipNum) |
| Reserved (driveType) |
| tag |
| firstSectorNumber |
| Reserved (sectorCount) |

Where:

- tag: used as indication of valid secondary image table. Must be 0x00112233.
- firstSectorNumber is the first 512B sector number of the secondary image.

For secondary image support, the primary image must reserve space for secondary image table. See the figure below for typical structures layout on expansion device.

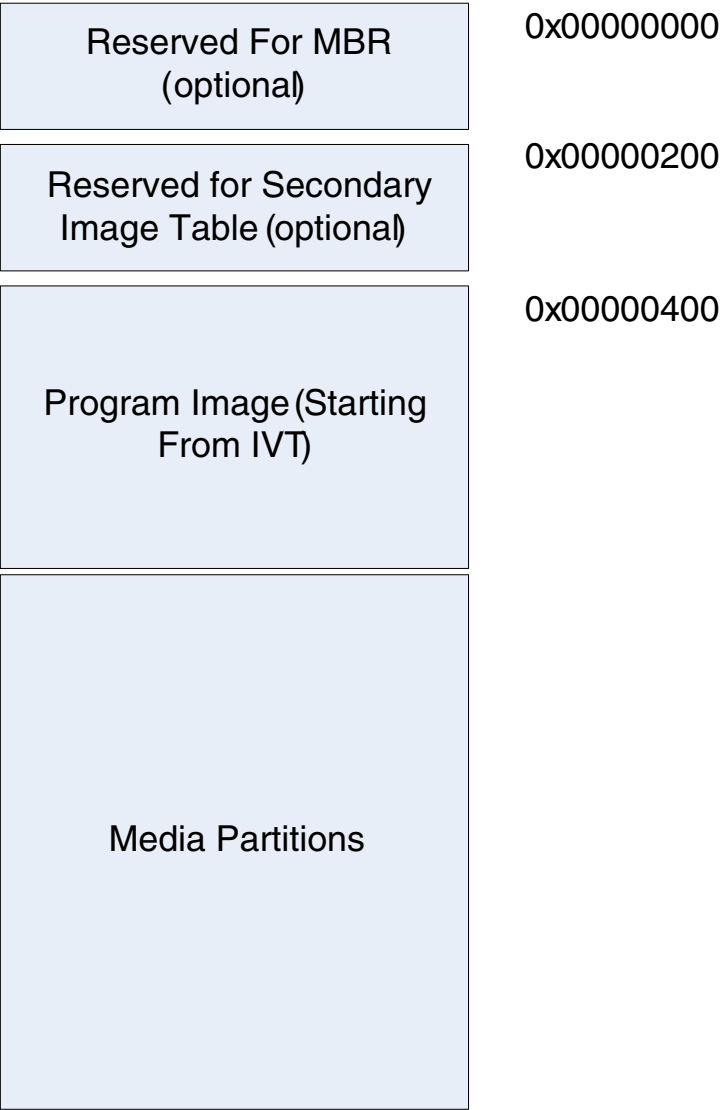

Figure 8-18. Hard Disk Structures Layout

For Closed mode, if there are failures during primary image authentication, the boot ROM will turn on PERSIST_SECONDARY_BOOT bit (see [Table 8-7](#)) and perform software reset. (After software reset secondary image will be used).

8.5.5 Serial ROM through SPI and I2C

The chip supports boot from serial memory devices, such as EEPROM and Serial Flash using the SPI.

The following ports are available for serial boot: ECSPI (ECSPI-1, ECSPI-2, ECSPI-3, ECSPI-4, ECSPI-5), and I2C Controller (I2C-1, I2C-2 and I2C-3) interfaces.

8.5.5.1 Serial ROM eFUSE Configuration

The boot ROM code determines the type of device using the following parameters, either provided by eFUSE settings or sampled on the I/O pins, during boot.

See the table below for details:

Table 8-22. Serial ROM Boot eFUSE Descriptions

| Fuse | Config | Definition | GPIO ¹ | Shipped Value | Settings |
|----------------|--------|---------------------------|-------------------|---------------|---|
| BOOT_CFG1[7:4] | OEM | Boot Device Selection | Yes | 0000 | 0011 - Boot from Serial ROM |
| BOOT_CFG4[5:4] | OEM | CS select (SPI only) | Yes | 00 | 00 - ECSPiX_SS0 01 - ECSPiX_SS1 10 - ECSPiX_SS2 11 - ECSPiX_SS3 |
| BOOT_CFG4[3] | OEM | SPI Addressing (SPI only) | Yes | 0 | 0 - 2-bytes (16-bit) 1 - 3-bytes (24-bit) |
| BOOT_CFG4[2:0] | OEM | Port Select | Yes | 00 | 000 - ECSPI-1 001 - ECSPI-2 010 - ECSPI-3 011 - ECSPI-4 100 - ECSPI-5 101- I2C-1 110- I2C-2 111- I2C-3 |

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

The ECPSI-1/ECPSI-2/ECPSI-3/ECPSI-4/ECSPI-5 block can be used as boot device using ECSPI interface for serial ROM boot. The SPI interface is configured to operate at 15MHz for 3-byte addressing device and 3.75MHz for 2-byte addressing devices.

The I2C-1/I2C-2/I2C-3 block can be used as boot device using I2C interface, for serial ROM boot. The I2C interface is configured to operate at 343.75 Kbps.

The boot ROM will copy 4Kbyte of data from Serial ROM device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

NOTE

The Initial 4K of Program Image must contain the IVT, DCD and the Boot Data structures.

8.5.5.2 I2C Boot

The boot flow when booting from an I2C device is shown in [Figure 8-19](#).

The boot ROM code reads the fuses BOOT_CFG1[7:4] (Boot Device Selection) and BOOT_CFG1[7:4] (Port select) to detect EEPROM device type. The ROM program copies 4K data from the EEPROM device to internal RAM. The boot ROM code next copies the initial 4Kbyte of data as well as rest of image directly to application destination extracted from application image.

The chip uses the Device Select Code/Device Address in the table below to boot from an EEPROM.

Table 8-23. EEPROM via I2C Device Select Code

| Bits | Device Type Identifier | | | | Chip Enable Address ¹ | | | R/W |
|--------------------|------------------------|---|---|---|----------------------------------|---|---|-----|
| | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Device Select Code | 1 | 0 | 1 | 0 | 0 | 0 | 0 | R/W |

1. These address bits, should be configured at the memory device, to match this '000' value.

Figure 8-19. I2C Flow Chart

8.5.5.2.1 I2C IOMUX Pin Configuration

The contacts assigned to the signals used by the three I2C blocks is shown in the table below.

Table 8-24. I2C IOMUX Pin Configuration

| Signal | I2C-1 | I2C-2 | I2c-3 |
|--------|--------------|--------------|--------------|
| SDA | EIM_D28.alt1 | EIM_D16.alt6 | EIM_D18.alt6 |
| SCL | EIM_D21.alt6 | EIM_EB2.alt6 | EIM_D17.alt6 |

8.5.5.3 ECSPI Boot

The Enhanced Configurable SPI (ECSPI) interface is configured in master mode and the EEPROM device is connected to ECSPI interface as a slave.

The boot ROM code copies 4 KB data from EEPROM device to the internal RAM. If DCD verification is successful, the ROM code copies the initial 4 KB data, as well as the rest of the image extracted from application image, directly to the application destination. The ECSPI can read data from EEPROM using 2 or 3 byte addressing. Its burst length is 32 bytes.

NOTE

The Serial ROM Chip Select Number is determined by
BOOT_CFG4[5:4] (Chip Select) fuse.

When using the SPI as boot device, the Chip supports booting from both Serial EEPROM and Serial Flash devices. The boot code determines which device is being used by reading the appropriate eFUSE/I/O values at boot (see [Table 8-22](#) for details).

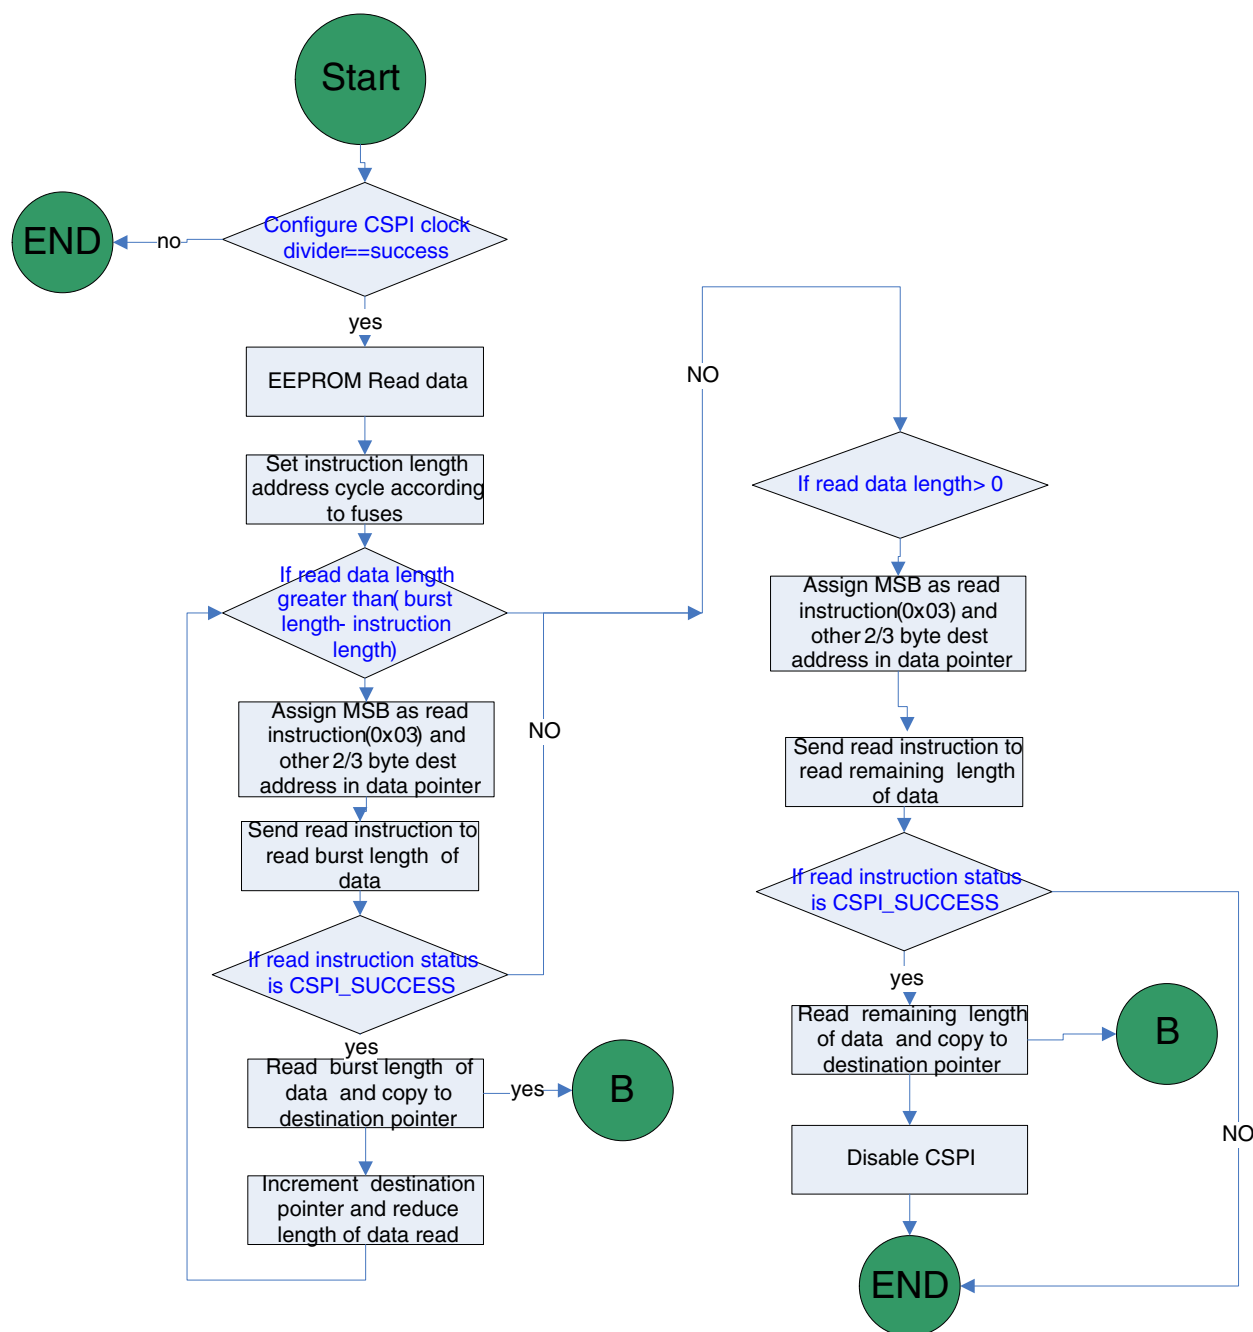

Figure 8-20. CSPI Flow chart

8.5.5.3.1 ECSPI IOMUX Pin Configuration

The contacts assigned to the signals used by the three CSPI blocks is shown in the table below.

Table 8-25. SPI IOMUX Pin Configuration

| Signal | ECSPI-1 | ECSPI-2 | ECSPI-3 | ECSPI4 | ECSPI-5 |
|-------------|------------------|-----------------|-----------------|--------------|---------------|
| MISO | EIM_D17.alt1 | CSIO_DAT10.alt2 | DISP0_DAT2.alt2 | EIM_D22.alt1 | SD1_DAT0.alt1 |

1. N/A in the ROM code indicates the pins are not available or not used.

8.6 Program image

This section describes the data structures that are required to be included in a user's program image. A program image consists of:

- Image vector table—A list of pointers located at a fixed address that the ROM examines to determine where other components of the program image are located
- Boot data—A table indicating the program image location, program image size in bytes, and the plugin flag
- Device configuration data—IC configuration data
- User code and data

8.6.1 Image Vector Table and Boot Data

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process. The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address and initial load region size for each boot device

type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder of the image memory map is flexible and is determined by the contents of the IVT.

Table 8-26. Image Vector Table Offset and Initial Load Region Size

| Boot Device Type | Image Vector Table Offset | Initial Load Region Size |
|----------------------|---------------------------|--------------------------|
| NOR | 4 Kbyte = 0x1000 bytes | Entire Image Size |
| NAND | 1 Kbyte = 0x400 bytes | 4 Kbyte |
| OneNAND | 256 bytes = 0x100 bytes | 1 Kbyte |
| SD/MMC/eSD/eMMC/SDXC | 1 Kbyte = 0x400 bytes | 4 Kbyte |
| I2C/SPI EEPROM | 1 Kbyte = 0x400 bytes | 4 Kbyte |
| SATA | 1 Kbyte = 0x400 bytes | 4 Kbyte |

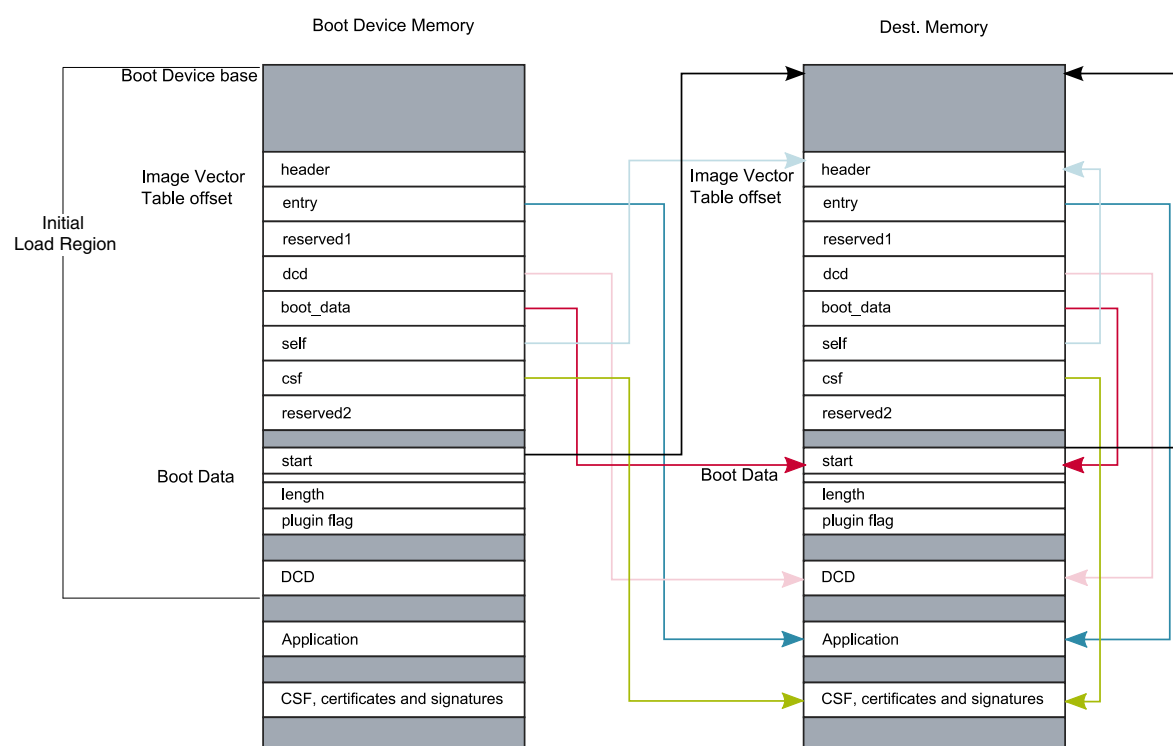

Figure 8-21. Image Vector Table

8.6.1.1 Image Vector Table Structure

The IVT has the following format where each entry is a 32 bit word:

Table 8-27. IVT Format

| |
|--|
| header |
| entry: Absolute address of the first instruction to execute from the image |
| reserved1: Reserved and should be zero |
| dcd: Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See Device Configuration Data (DCD) for further details on DCD. |
| boot data: Absolute address of the Boot Data |
| self: Absolute address of the IVT. Used internally by the ROM |
| csf: Absolute address of Command Sequence File (CSF) used by the HAB library. See High Assurance Boot (HAB) for details on secure boot using HAB. This field must be set to NULL when not performing a secure boot |
| reserved2: Reserved and should be zero |

The IVT header has the following format:

Table 8-28. IVT Header Format

| Tag | Length | version |
|-----|--------|---------|
|-----|--------|---------|

where:

Tag: A single byte field set to 0xD1

Length: a two byte field in big endian format containing the overall length of the IVT, in bytes, including the header. (the length is fixed and must have a value of 32 bytes)

Version: A single byte field set to 0x40 or 0x41

8.6.1.2 Boot Data Structure

The Boot Data must follow the format defined in the table found here, each entry is a 32-bit word.

Table 8-29. Boot Data Format

| | |
|--------|---|
| start | Absolute address of the image |
| length | Size of the program image |
| plugin | Plugin flag (see Plugin Image) |

8.6.2 Device Configuration Data (DCD)

Upon reset, the Chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving optimal system performance and there are even some peripherals that must be configured before they can be used.

The DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various peripherals on the Chip.

For example, the EIM default settings allow the core to interface to a NOR flash device immediately out of reset. This allows the Chip to interface with any NOR flash device, but has the cost of slow performance. Additionally, some components such as DDR require some sequence of register programming as part of configuration before it is ready to be used. The DCD feature can be used to program the EIM registers and MMDC registers to the optimal settings.

The ROM determines the location of the DCD table based on information located in the Image Vector Table (IVT). See [Image Vector Table and Boot Data](#) for more details. The DCD table shown below is a big endian byte array of the allowable DCD commands. The maximum size of the DCD limited to 1768 bytes.

Table 8-30. DCD Data format

| |
|--------|
| Header |
| [CMD] |
| [CMD] |
| ... |

The DCD header is 4 bytes with the following format:

Table 8-31. DCD Header

| Tag | Length | Version |
|-----|--------|---------|
|-----|--------|---------|

where:

Tag: A single byte field set to 0xD2

Length: a two byte field in big endian format containing the overall length of the DCD, in bytes, including the header

Version: A single byte field set to 0x41

8.6.2.1 Write Data Command

The Write Data Command is used to write a list of given 1-, 2- or 4-byte values or bitmasks to a corresponding list of target addresses.

The format of Write Data Command, again a big endian byte array, is shown in the table below.

Table 8-32. Write Data Command Format

| Tag | Length | Parameter |
|-----|--------|-----------|
|-----|--------|-----------|

Table continues on the next page...

Table 8-32. Write Data Command Format (continued)

| |
|--------------|
| Address |
| Value/Mask |
| [Address] |
| [Value/Mask] |
| ... |
| [Address] |
| [Value/Mask] |

where:

Tag: A single byte field set to 0xCC

Length: A two byte field in big endian format containing the length of the Write Data Command, in bytes, including the header

Address: target address to which data should be written

Value/Mask: data value or bitmask to be written to preceding address

The Parameter field is a single byte divided into bitfields as follows:

Table 8-33. Write Data Command Parameter field

| | | | | | | | |
|-------|---|---|---|---|-------|---|---|
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| flags | | | | | bytes | | |

where

bytes: width of target locations in bytes. Either 1, 2 or 4

flags: control flags for command behavior.

Data Mask = bit 3: if set, only specific bits may be overwritten at target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, bits at the target address overwritten with this flag (otherwise it is ignored)

One or more target address and value/bitmask pairs can be specified. The same bytes and flags parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

Table 8-34. Interpretation of Write Data Command Flags

| "Mask" | "Set" | Action | Interpretation |
|--------|-------|----------------------|----------------|
| 0 | 0 | *address = val_msk | Write value |
| 0 | 1 | *address = val_msk | Write value |
| 1 | 0 | *address &= ~val_msk | Clear bitmask |
| 1 | 1 | *address = val_msk | Set bitmask |

NOTE

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values is larger or any of the bitmasks is wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within an allowed region, none of the values are written. The list of allowable blocks and target addresses for the Chip are given below.

Table 8-35. Valid DCD Address Ranges

| Address range | Start address | Last Address |
|----------------------------------|---------------|--------------|
| IOMUX Control (IOMUXC) registers | 0x020E0000 | 0x020E3FFF |
| CCM register set | 0x020C4000 | 0x020C7FFF |
| ANADIG registers | 0x020C8000 | 0x020C8FFF |
| MMDC register set | 0x021B0000 | 0x021B7FFF |
| IRAM Free Space | 0x00907000 | 0x00937FF0 |
| EIM - Memory | 0x08000000 | 0x0FFEFFFF |
| EIM - Registers | 0x021B8000 | 0x021BBFFF |
| DDR | 0x10000000 | 0xFFFFFFFF |

8.6.2.2 Check Data Command

The Check Data Command is used to test for a given -1, 2- or 4-byte bitmasks from a source address.

The Check Data Command is a big endian byte array with format shown in the table below.

Table 8-36. Check Data Command Format

| Tag | Length | Parameter |
|-----|---------|-----------|
| | Address | |
| | Mask | |
| | [Count] | |

where:

Tag: A single byte field set to 0xCF

Length: A two byte field in big endian format containing the length of the Check Data Command, in bytes, including the header

Program image

Address: source address to test

Mask: bit mask to test

Count: optional poll count. If count is not specified this command will poll indefinitely until the exit condition is met. If count = 0, this command behaves as for NOP.

The Parameter field is a single byte divided into bitfields as follows:

Table 8-37. Check Data Command Parameter field

| | | | | | | | |
|-------|---|---|---|---|-------|---|---|
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| flags | | | | | bytes | | |

where

bytes: width of target locations in bytes. Either 1, 2 or 4

flags: control flags for command behavior.

Data Mask = bit 3: if set, only specific bits may be overwritten at target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, bits at the target address overwritten with this flag (otherwise it is ignored)

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

Table 8-38. Interpretation of Check Data Command Flags

| "Mask" | "Set" | Action | Interpretation |
|--------|-------|---------------------------|----------------|
| 0 | 0 | (*address & mask) == 0 | All bits clear |
| 0 | 1 | (*address & mask) == mask | All bits set |
| 1 | 0 | (*address & mask) != mask | Any bit clear |
| 1 | 1 | (*address & mask) != 0 | Any bit set |

NOTE

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

8.6.2.3 NOP Command

This command has no effect.

The format of NOP Command is a big endian four byte array as shown in the table below.

Table 8-39. NOP Command Format

| | | |
|-----|--------|-----------|
| Tag | Length | Undefined |
|-----|--------|-----------|

where:

Tag: A single byte field set to 0xC0

Length: A two byte field in big endian containing the length of the NOP Command in bytes. Fixed to a value of 4.

Undefined: This byte is ignored and can be set to any value.

8.6.2.4 Unlock Command

The Unlock Command is used to prevent specific engine features being locked when exiting ROM.

The format of Unlock Command, again a big endian byte array, is shown in the table below.

Table 8-40. Unlock Command Format

| Tag | Length | Eng |
|-----|--------|-----|
| | Value | |
| | Value | |
| | ... | |
| | Value | |

where:

Tag: A single byte field set to 0xB2

Eng: Engine to be left unlocked.

Values: [optional] unlock values required by engine.

NOTE

This command may not be used in DCD structure if the SEC_CONFIG is configured as closed.

8.7 Plugin Image

The ROM supports a limited number of boot devices. For using other devices as boot source (for example, Ethernet, CDROM, or USB), the supported boot device must be used (typically serial ROM) for firmware with the missing boot drivers. >Additionally plugin can customize supported boot drivers. It is more flexible when doing device initialization, such as condition judging, delay assertion, applying custom settings to boot device and memory system.

>In addition to standard images, the chip also supports plugin images. Plugin images return execution to the ROM whereas a standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see [Boot Data Structure](#)). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end the plugin function must return with the program image parameters. (See [High level boot sequence](#) for details about boot flow).

The boot ROM authenticates the plugin image prior to running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

```
typedef unsigned char (*) plugin_download_f(void **start, size_t *bytes, UINT32
*ivt_offset)
```

ARGUMENTS PASSED:

- start - Image load address on exit.
- bytes - Image size on exit.
- ivt_offset - Offset in bytes of the IVT from the image start address on exit.

RETURN VALUE:

- 1 - on success
- 0 - on failure

8.8 Serial Downloader

The Serial Downloader provides a means to download a Program Image to the chip over USB serial connection.

In this mode the ROM programs WDOG-1 for a 32-second time-out if WDOG_ENABLE eFuse is 1, and then continuously polls for USB connection. If no activity is found on USB OTG1 and the watchdog timer expires, the ARM core is reset.

NOTE

The downloaded image must continue to service the watchdog timer to avoid an undesired reset from occurring.

The USB boot flow is shown in the figure below.

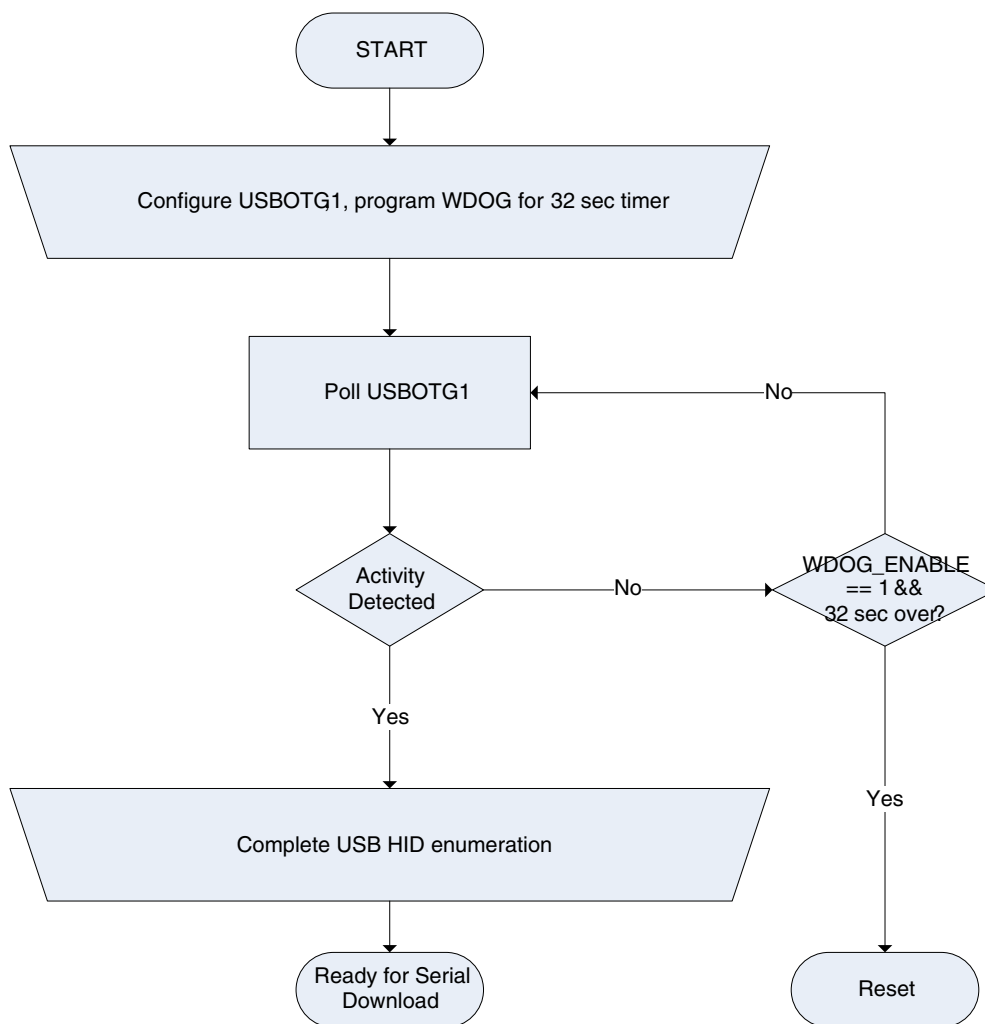

Figure 8-22. USB Boot Flow

8.8.1 USB

USB support is composed of the USBOH3 (USB OTG1 core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB OTG port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of 4 HID reports are used to implement SDP protocol for data transfers as described in [Table 8-41](#).

Table 8-41. USB HID Reports

| Report ID (first byte) | Transfer Endpoint | Direction | Length | Description |
|------------------------|-------------------|----------------|------------------|---|
| 1 | control OUT | Host to device | 17 bytes | SDP command from host to device |
| 2 | control OUT | Host to device | Up to 1025 bytes | Data associated with report 1 SDP command |
| 3 | interrupt | Device to host | 5 bytes | HAB security configuration. Device sends 0x12343412 in closed mode and 0x56787856 in open mode. |
| 4 | interrupt | Device to host | Up to 65 bytes | Data in response to SDP command in report 1 |

8.8.1.1 USB Configuration Details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for USB device driver are listed in the table below.

Table 8-42. VID/PID and Strings for USB Device Driver

| Descriptor | Value |
|-----------------------------------|---|
| VID | 0x15A2 (Freescale vendor ID) |
| PID ¹ | 0x0054 |
| String Descriptor1 (manufacturer) | Freescale Semiconductor, Inc. |
| String Descriptor2 (product) | S Blank ARIK SE Blank ARIK NS Blank ARIK |
| String Descriptor4 | Freescale Flash |
| String Descriptor5 | Freescale Flash |

1. Allocation based on BPN (Before Part Number)

8.8.1.2 IOMUX Configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX. The UTMI PHY interface uses dedicated contacts on the IC. See the Chip data sheet for details.

8.8.2 Serial Download protocol

The 16 byte SDP command from host to device is sent using HID report 1.

The table below describes 16 byte SDP command data structure:

Table 8-43. 16 Byte SDP Command Data Structure

| BYTE Offset | Size | Name | Description |
|-------------|------|--------------|--|
| 0 | 2 | COMMAND TYPE | The following commands are supported for i.MX6 Dual/6Quad ROM: <ul style="list-style-type: none"> • 0x0101 READ_REGISTER • 0x0202 WRITE_REGISTER • 0x0404 WRITE_FILE • 0x0505 ERROR_STATUS • 0x0A0A DCD_WRITE • 0x0B0B JUMP_ADDRESS |
| 2 | 4 | ADDRESS | Only relevant for following commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS. For READ_REGISTER and WRITE_REGISTER commands, this field is address to a register. For WRITE_FILE and JUMP_ADDRESS commands, this field is an address to internal or external memory address. |
| 6 | 1 | FORMAT | Format of access, 0x8 for 8-bit access, 0x10 for 16-bit and 0x20 for 32-bit access. Only relevant for READ_REGISTER and WRITE_REGISTER commands. |
| 7 | 4 | DATA COUNT | Size of data to read or write. Only relevant for WRITE_FILE, READ_REGISTER, WRITE_REGISTER and DCD_WRITE commands. For WRITE_FILE and DCD_WRITE commands DATA COUNT is in byte units. |
| 11 | 4 | DATA | Value to write. Only relevant for WRITE_REGISTER command. |
| 15 | 1 | RESERVED | Reserved |

8.8.2.1 SDP Command

SDP commands are described in the following sections.

8.8.2.1.1 READ REGISTER

The transaction for command READ_REGISTER consists of following reports: Report1 for command, Report3 for security configuration and Report4 for response or register value.

The register to read is specified in ADDRESS field of SDP command. First device sends Report3 with security configuration followed by Report4 with bytes read at given address. If count is greater than 64 then multiple reports with report id 4 are sent until entire data requested by host is sent. The STATUS is either 0x12343412 for closed parts and 0x56787856 for open or field return parts.

Report1, Command, Host to Device:

| | |
|---|---|
| 1 | Valid values for READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT |
|---|---|

ID 16 byte SDP Command

Report3, Response, Device to Host:

| | |
|---|---|
| 3 | 4 bytes indicating security configuration |
|---|---|

ID 4 bytes status

Report4, Response, Device to Host: first response report

| | |
|---|----------------|
| 4 | Register Value |
|---|----------------|

ID 4 bytes of data containing register value. If number of bytes requested is less than 4 then remaining bytes should be ignored by host.

Multiple reports of report id 4 are sent until entire data requested is sent

Report4, Response, Device to Host: Last response report

| | |
|---|----------------|
| 4 | Register Value |
|---|----------------|

ID 64 bytes of data containing register value. If number of bytes requested is less than 64 then remaining bytes should be ignored by host.

8.8.2.1.2 WRITE_REGISTER

The transaction for command WRITE_REGISTER consists of the following reports: Report1 for command, Report3 for security configuration and Report4 for write status.

Host sends Report1 with WRITE_REGISTER command. The register to write is specified in ADDRESS field of SDP command of Report1, with FORMAT field set to data type (number of bits to write 8, 16 or 32) and value to write in DATA field of SDP command. Device writes the DATA to register address and returns WRITE_COMPLETE code using Report4 and security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

| | |
|---|---|
| 1 | Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA |
|---|---|

ID 16 byte SDP Command

Report3, Response, Device to Host:

| | |
|---|---|
| 3 | 4 bytes indicating security configuration |
|---|---|

ID 4 bytes status

Report4, Response, Device to Host:

| | |
|---|------------------------------------|
| 4 | WRITE_COMPLETE (0x128A8A12) status |
|---|------------------------------------|

ID 64 bytes data with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

8.8.2.1.3 WRITE_FILE

The transaction for command WRITE_FILE consists of following reports: Report1 for command-phase, Report2 for data-phase, Report3 for hab mode and Report4 to indicate data received in full.

The size of each Report2 is limited to 1024 bytes (limitation of USB HID protocol) hence multiple Report2 packets will be sent by host in data phase until entire data is transferred to device. Once entire data (DATA_COUNT bytes) is received then device sends report 3 with hab mode and report 4 with 0x88888888, indicating file download completed.

Report1, Host to Device:

| | |
|---|--|
| 1 | Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT |
|---|--|

ID 16 byte SDP Command

=====Optional Begin=====

Host sends ERROR_STATUS command to query if HAB rejected the address

===== Optional End=====

Report2, Host to Device:

| | |
|---|-----------|
| 2 | File data |
|---|-----------|

ID Max 1024 bytes data per report

Report2, Host to Device:

| | |
|---|-----------|
| 2 | File data |
|---|-----------|

ID Max 1024 bytes data per report

Report3, Device to Host:

| | |
|---|---|
| 3 | 4 bytes indicating security configuration |
|---|---|

ID 4 bytes status

Report4, Response, Device to Host:

| | |
|---|------------------------------|
| 4 | COMPLETE (0x88888888) status |
|---|------------------------------|

ID 64 bytes data with first 4 bytes to indicate file download has completed with code 0x88888888. On failure device will report HAB error status.

8.8.2.1.4 ERROR_STATUS

The transaction for SDP command ERROR_STATUS consists of three reports.

Report1 is used by host to send the command; device sends global error status in 4 bytes of Report4 after returning security configuration in Report3. When device receives ERROR_STATUS command it will return global error status that is updated for each command. This command is useful to find out if last command resulted in device error or succeeded.

Report1, Command, Host to Device:

| | |
|---|----------------------|
| 1 | ERROR_STATUS COMMAND |
|---|----------------------|

ID 16 byte SDP Command

Report3, Response, Device to Host:

| | |
|---|---|
| 3 | 4 bytes indicating security configuration |
|---|---|

ID 4 bytes status

Report4, Response, Device to Host:

| | |
|---|----------------------|
| 4 | 4 bytes Error status |
|---|----------------------|

ID first 4 bytes status in 64 bytes report 4

8.8.2.1.5 DCD WRITE

The SDP command DCD_WRITE is used by host to send multiple register writes in one shot. This command is provided to speed up the process of programming register writes such as to configure external RAM device.

The command goes with Report1 from host with COMMAND TYPE set to DCD_WRITE, ADDRESS which is used for temporary location of DCD data and DATA_COUNT to number of bytes sent in data out phase. In data phase host sends data for number of registers using Report2. Device completes the transaction with Report3 indicating security configuration and report 4 with WRITE_COMPLETE code 0x12828212.

Report1, Command, Host to Device:

| | |
|---|--|
| 1 | DCD_WRITE COMMAND, ADDRESS, DATA_COUNT |
|---|--|

ID 16 byte SDP Command

Report2, Data, Host to Device:

| | |
|---|-----------------|
| 2 | DCD binary data |
|---|-----------------|

ID Max 1024 bytes per report

Report3, Response, Device to Host:

| | |
|---|---|
| 3 | 4 bytes indicating security configuration |
|---|---|

ID 4 bytes status

Report4, Response, Device to Host:

| | |
|---|------------------------------------|
| 4 | WRITE_COMPLETE (0x128A8A12) status |
|---|------------------------------------|

ID 64 bytes report with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

See [Device Configuration Data \(DCD\)](#) for DCD format description.

8.8.2.1.6 JUMP ADDRESS

The SDP command JUMP_ADDRESS will be the last command host can send to the device, after this command device will jump to the address specified in the ADDRESS field of SDP command and start executing.

This command should typically follow after WRITE_FILE command. The command is sent by host in command-phase of transaction using Report1, there is no data phase for this command but device send status report3 to complete the transaction. And if HAB authentication fails then it will also send report 4 with HAB error status.

Report1, Command, Host to Device:

| | |
|---|-------------------------------|
| 1 | JUMP_ADDRESS COMMAND, ADDRESS |
|---|-------------------------------|

ID 16 byte SDP Command

Report3, Response, Device to Host:

| | |
|---|---|
| 3 | 4 bytes indicating security configuration |
|---|---|

ID 4 bytes status

This report is sent by device only in case of an error jumping to the given address, device reports error in Report4, Response, Device to Host:

| | |
|---|--------------------------|
| 4 | 4 bytes HAB error status |
|---|--------------------------|

ID 4 bytes status, 64 bytes report length

8.9 Recovery Devices

The Chip supports recovery devices. If primary boot device fails, boot ROM will try to boot from recovery device using one of I2C or ECSPI ports.

For enabling recovery device BOOT_CFG4[6] fuse must be set. Additionally Serial EEPROM fuses must be set as described in [Serial ROM through SPI and I2C](#).

8.10 USB Low Power Boot

ROM supports USB Low Power Boot. This feature enables a device with dead or weak battery to power up and boot if the device is connected to a USB upstream port, no matter the upstream port is a USB charger or USB host/hub.

If a USB dedicated charger or host/hub charger are connected, as soon as the device is connected to the upstream port, a stable current (Max.1.5A) can be supplied by charger. If USB host/hub are connected, the maximal 1 00mA current is supplied to the device, the device should be able to power up to boot the image with less than 100mA.

If LPB_BOOT fuses are blown, the Chip will check if there is low power condition via GPIO_3 pad. If there is low power boot condition USB charger detection will be activated. If there is no USB charger, ROM will initialize USB as device and apply division factors on ARM, DDR, AXI and AHB root clocks based on LPB_BOOT fuses value (see the table below). Polarity of low power boot condition on GPIO_3 pad is set by BT_LPB_POLARITY fuse (see the figure below).

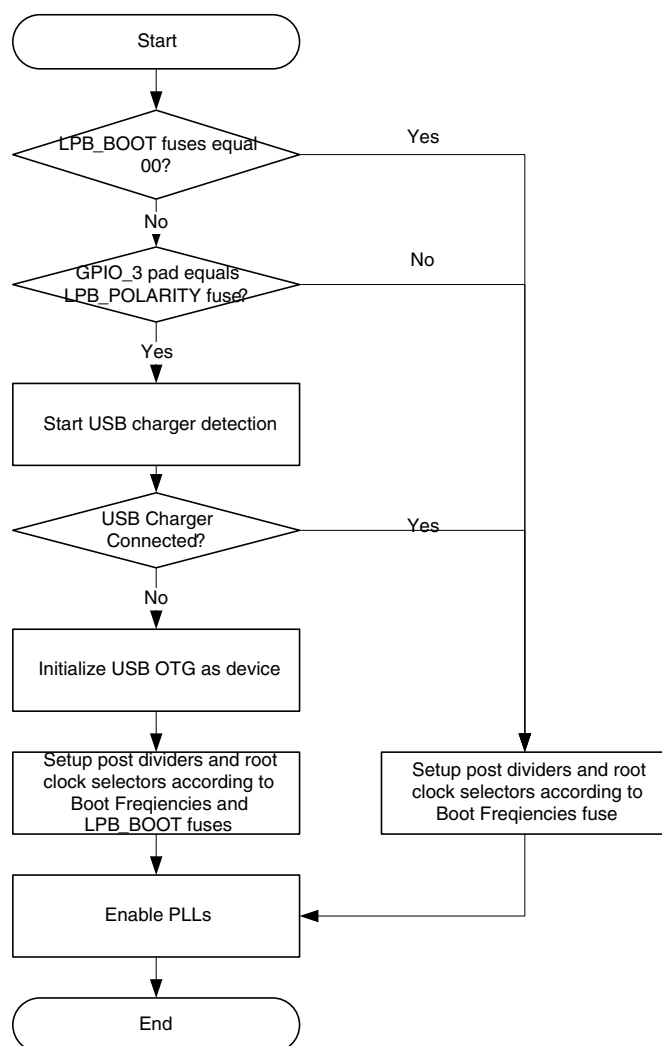

Table 8-66. USB Low Power Boot Frequencies

| LPB_BOOT | Boot Frequencies=0 | Boot Frequencies=1 |
|----------|---|--|
| 00 | ARM_CLK_ROOT=792MHz MMDC_CH0_AXI_CLK_ROOT=528MHz MMDC_CH1_AXI_CLK_ROOT=528MHz AXI_CLK_ROOT=264MHz AHB_CLK_ROOT=132MHz | ARM_CLK_ROOT=396MHz MMDC_CH0_AXI_CLK_ROOT=352MHz MMDC_CH1_AXI_CLK_ROOT=352MHz AXI_CLK_ROOT=176MHz AHB_CLK_ROOT=88MHz |
| 01 | ARM_CLK_ROOT=792MHz MMDC_CH0_AXI_CLK_ROOT=528MHz MMDC_CH1_AXI_CLK_ROOT=528MHz AXI_CLK_ROOT=264MHz AHB_CLK_ROOT=132MHz | ARM_CLK_ROOT=396MHz MMDC_CH0_AXI_CLK_ROOT=352MHz MMDC_CH1_AXI_CLK_ROOT=352MHz AXI_CLK_ROOT=176MHz AHB_CLK_ROOT=88MHz |

Table continues on the next page...

**Table 8-66. USB Low Power Boot Frequencies
(continued)**

| | | |

**Figure 8-23. USB Low Power Boot Flow**

8.11 High Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying areas of code or data in programmable memory to make it behave in an incorrect manner. The HAB also prevents attempts to gain access to features which should not be available.

The integration of the HAB feature with the ROM code ensures that Chip does not enter an operational state if the existing hardware security blocks have detected a condition that may be a security threat or areas of memory deemed to be important have been modified. The HAB uses RSA digital signatures to enforce these policies.

Figure 8-24. Secure Boot Components

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to ensure the system security state is as expected. The HAB also makes use of CAAM hardware block to accelerate SHA-256 message digest operations performed during signature verifications and AES-128 operations for encrypted boot operations. The HAB also includes a software implementation of SHA-256 for cases where a hardware accelerator cannot be used. The RSA key sizes supported are 1024, 2048 and 3072 bits. The RSA signature verification operations are performed by a software implementation contained in the HAB library. The main features supported by HAB are:

- X.509 Public key certificate support

- CMS signature format support
- Proprietary encrypted boot support. Note that encrypted boot depends on the CAAM HW module. When CAAM is disabled (i.e. when the EXPORT_CONTROL fuse is blown) then encrypted boot is not available.

NOTE

Freescale provides a reference Code Signing Tool (CST) for key generation, certificate generation and code signing for use with the HAB library. The CST can be found by searching for "IMX_CST_TOOL" at <http://www.freescale.com>.

NOTE

For further details on making use of the secure boot feature using HAB contact your local Freescale representative.

8.11.1 ROM Vector Table Addresses

For devices that perform a secure boot, the HAB library may be called by boot stages that execute after ROM code. The RVT table contains the pointers to the HAB API functions and is located at 0x00000094.

NOTE

For additional information on secure boot including the HAB API, contact your local Freescale representative.

Chapter 9

Multimedia

9.1 Video Graphics Sub System

The i.MX 6Dual/6Quad video graphics subsystem consists of the dedicated modules found here.

- Video Processing Unit (VPU): a multi-standard high performance video/image CODEC
- Three Graphics Processing Units (GPUs):
 - 3D GPU: accelerating the generation of 3D graphics (OpenGL/ES) and vector graphics (OpenVG)
 - 2D GPU: acceleration the generation of 2D graphics (BitBLT).
 - OpenVG: acceleration of vector graphics (OpenVG).
- Two (identical) Image Processing Units (IPUs): providing connectivity to cameras and displays, related processing, synchronization and control.
- Display interface bridges: providing optional translation from the digital display interface supported by the IPU to other interfaces:
 - LVDS bridge (LDB): providing up to two LVDS interfaces
 - HDMI transmitter
 - MIPI/DSI transmitter
- MIPI/CSI-2 receiver
- Two (identical) Display Content Integrity Checker (DCIC) are used to authenticate sensitive displayed data.
- A Video Data Order Adapter (VDOA): used to re-order video data from the "tiled" order used by the VPU to the conventional raster-scan order needed by the IPU.

High level integration scheme of the i.MX 6Dual/6Quad video/graphics system is provided by the figure below.

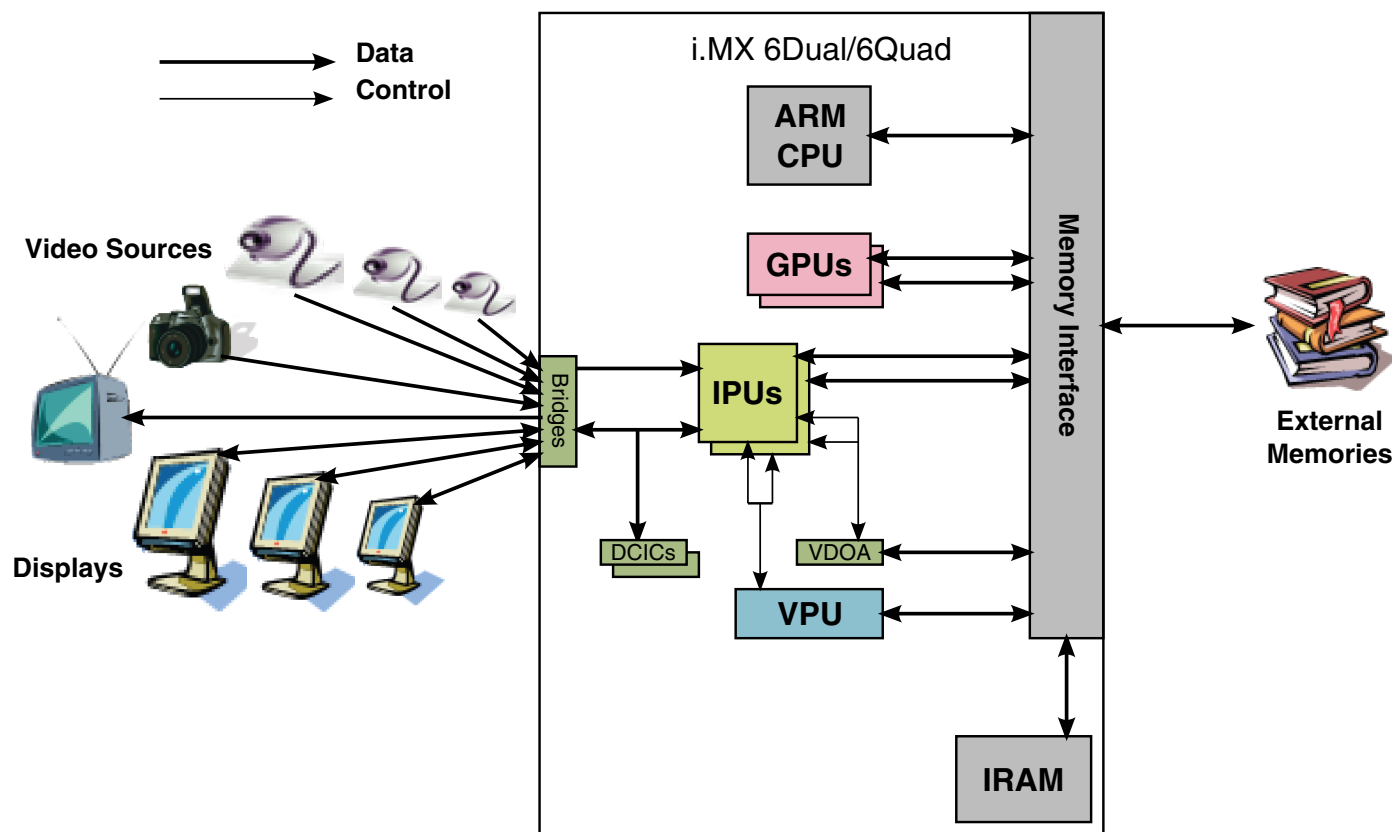

Figure 9-1. i.MX 6Dual/6Quad Video-Graphics Subsystem

9.1.1 Display outputs

The i.MX 6Dual/6Quad implements a robust muxing logic on the four display ports (2x per IPU), to the external interfaces, either direct, or via bridges (MIPI, LVDS, HDMI), per description below:

- Two parallel - driven directly by each of the IPU(s); pixel clock at least up to 200 MHz (for external load of up to 10 pF).
 - Parallel interface works up to 200 MHz
 - HDMI interface works up to 240 MHz (IPU)
- Two LVDS channels, driven by the LDB; pixel clock up to 170 MHz.
- One HDMI port (ver. 1.4) - driven by the HDMI transmitter: pixel clock up to 264 MHz (gated by the IPU capabilities)
- One MIPI/DSI port - driven by the MIPI/DSI transmitter; 2 data lanes at 1 GHz
- Each IPU display port (DI) can be connected to each of the above ports

- Each IPU has 2 display ports, up to four external ports can be active at any given time. (Additional asynchronous data flows can be sent though the parallel ports and the MIPI/DSI port.)
- Read access is supported as follows
 - For the Parallel0 port: through DI00
 - For the Parallel1 port: through DI10
 - For the MIPI/DSI port: through DI01 or DI11
- Inputs to either of the DCICs are taken from one of the following buses
 - For each of the parallel interfaces: probing the I/O loopback (essentially equivalent to probing the external wires).
 - For other integrated interfaces (e.g. LVDS): probing the DI1 output of each of the IPU's (essentially equivalent to the inputs to the serializers)
 - For the data enable signal, two control signals are probed from each of the above buses.

For visual view of display signal routing, see the following figure. The chip MUX select signals are driven by configuration bits as specified in the IOMUX controller (IOMUXC) chapter in the IOMUXC_IOMUXC_GPR registers description fields.

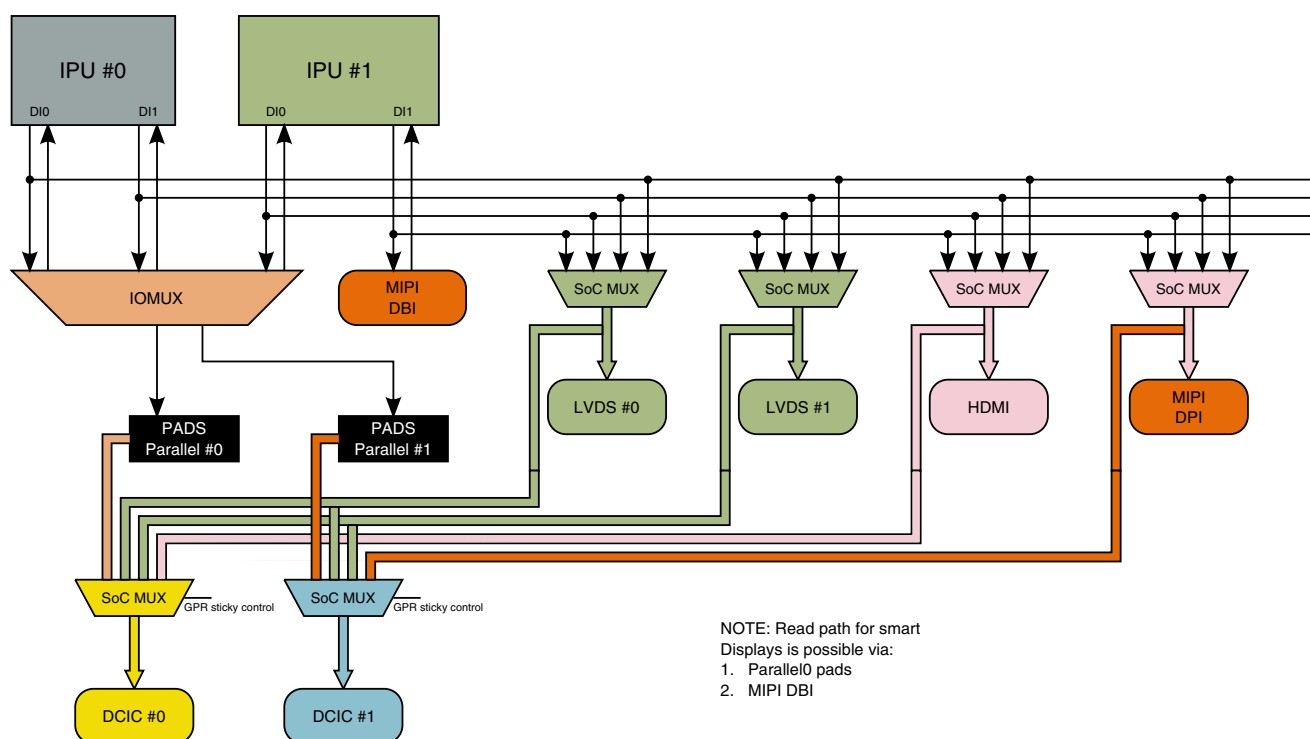

Figure 9-2. Display port muxing scheme

9.1.2 Video input

There are 3 video input ports (e.g. from image sensors).

See the figure below for details.

Video Input Ports Connectivity

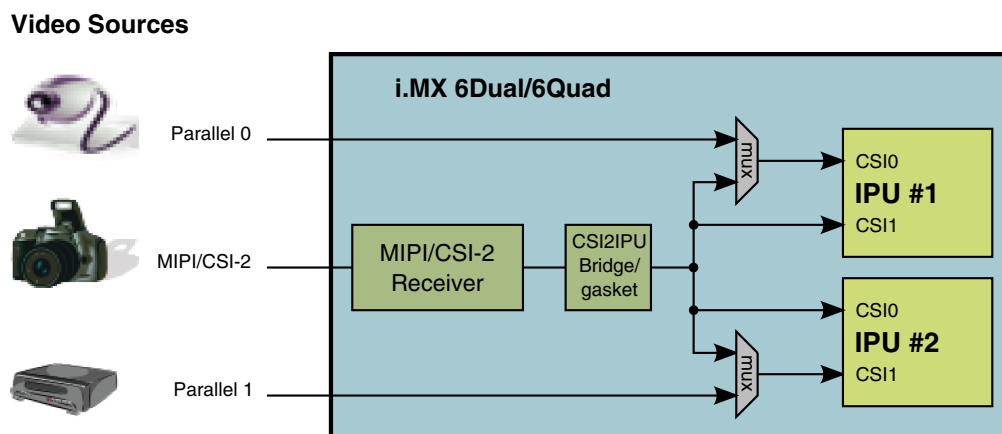

Figure 9-3. The Video Input Ports

Two parallel ports are connected directly to an IPU input port.

One MIPI/CSI-2 port- IPU receives two components per cycle from the MIPI_CSI2 interface. The maximum bandwidth of the interface is as follows:

- 400MByte/sec for four data lanes configuration (800Mbps/lane)
- 375MByte/sec for 3 data lanes configuration (1000Mbps/lane)
- 250MByte/sec for 2 data lanes configuration (1000Mbps/lane)
- 125Mbyte/sec for 1 data lanes configuration (1000Mbps/lane)

Each IPU has two input ports, CSI0 and CSI1, which can receive data concurrently and independently. At any given time, an IPU input port may receive data either from a parallel external port or from the MIPI/CSI-2 receiver.

The MIPI/CSI-2 port can receive up to 4 concurrent data channels. Each data channel is routed to a different CSI input of the IPU (2 IPU, 2 CSIs on each IPU; a total of 4 CSI inputs). Pixel data can be further processed by the IPU. Other data types can be transferred through a CSI transparently as generic data to the system memory.

The IPU, VPU, VDOA and the GPUs have master AXI ports, providing access to system memory.

The modules are controlled (by the ARM CPU or the SDMA) as follows:

- The LDB is controlled by signals connected to top-level registers.
- All other modules have a host interface. For the VPU, VDOA and the DCIC's, this is a slave IP port and for the MIPI bridges, GPUs, HDMI and IPU's, this is a slave AHB port.
- The data flow between VPU, VDOA, GPUs and IPU's is through system memory and it is normally controlled by the CPU. For special situations, a direct synchronization interface is provided:
 - An interface between the IPU's and VPU, for low-latency video record.
 - An interface between the VDOA and IPU's, for tight pipelining of data from the VDOA to the IPU, through the IRAM.

9.1.3 Synchronization Mechanisms

The i.MX 6Dual/6Quad provides HW synchronization mechanism between IPU and VPU and between IPU and VDOA to reduce core intervention and enable lock-step operation.

9.1.3.1 Synchronization between the VDOA and the IPU

The VDOA can transfer its output to the IPU through internal memory, containing a band double buffer.

This tight double-buffering synchronization is performed without CPU involvement, using dedicated signals between the VDOA and IPU and the same protocol as used between two IPU DMA channels.

This synchronization is supported for each of the IPU's, with muxing between the IPU's performed at SoC level.

Within the IPU, this synchronization is supported only for asynchronous flows .

9.1.4 Supported applications

The system described above supports a wide variety of video/graphics applications. The following table describes the main applications.

Table 9-1. Video/graphics applications

| Application | Features |
|--------------------|----------|
| Display management | |

Table continues on the next page...

- A video call-both sides

9.2 Image Processing Unit (IPU)

The following table shows the IPU IP parametric table.

Table 9-2. IPU IP Parametric Table

| Name | IPU |
|---|--|
| Function | Connectivity to cameras and displays; related processing; synchronization and control |
| External I/O Pins Notes: This is the pinout of the IPU module At chip level, some of the pins are muxed and some are omitted. Additional GPIO pins are required to construct the connection. This is not included in this list. | Parallel Display port: 32 bit data, ~18 clocks and controls. Regular CMOS IO type, 264 MHz max. May be also connected to internal connectivity bridges. Slow Serial Display port: 2 bit data, 3 clocks and controls. Regular CMOS IO type, 120 MHz max. Parallel Sensor port: 20 bit data inputs, 5-6 clocks and controls. Regular CMOS IO type, 240 MHz max. Camera strobe port: 6 camera control outputs. Regular CMOS IO type, 120 MHz max. |
| SoC Buses | AXI master - for accessing the memory AHB slave - for programming, control and direct access of the MCU to the display |
| Interrupts | Two interrupts: functional and error |
| DMA Requests | Includes an integral DMA controller, with an AXI master port Also one DMA request to the SDMA |
| Number of instantiations | 2 |
| Clock sources and range | HSP_CLK - Internal high-speed processing clock: up to 264 MHz DI_CLK0, DI_CLK1 - Display interface clocks: up to 240 MHz |

The goal of the IPU is to provide comprehensive support for the flow of data from an image sensor and/or to a display device. This support covers all aspects of these activities:

- Connectivity to relevant devices - cameras, displays, graphics coprocessors, TV encoders and decoders.

- Related image processing and manipulation: image enhancements and conversions, etc.
- Synchronization and control capabilities (to avoid tearing artifacts, for example)

This integrative approach leads to several significant advantages:

- **Automation:** The involvement of the MCU (Main Control Unit) in image management is minimized. In particular, display refresh/update and a camera preview (displaying the input from an image sensor) can be performed completely autonomously. The resulting benefits are reducing the overhead due to SW-HW synchronization, freeing the MCU to perform other tasks and reduced power consumption (when the MCU is idle and can be powered down).
- **Optimal data path:** Access to system memory is minimized. In particular, significant processing can be performed on-the-fly while receiving data from an image sensor and/or sending data to a display. System memory is used essentially only when a change in pixel order or frame rate is needed. The resulting benefits are reduced load on the system bus and further reduction of power consumption.
- **Resource sharing:** Maximal HW reuse for different applications, resulting with the support of a wide range of requirements with minimal hardware

The hardware reuse mentioned above is enabled by a sophisticated configurability of each hardware block. This configurability also allows the support of a wide range of external devices, data formats and operation modes.

A simplified block diagram of the IPU is given in the figure below. The role of each block is described in the table below.

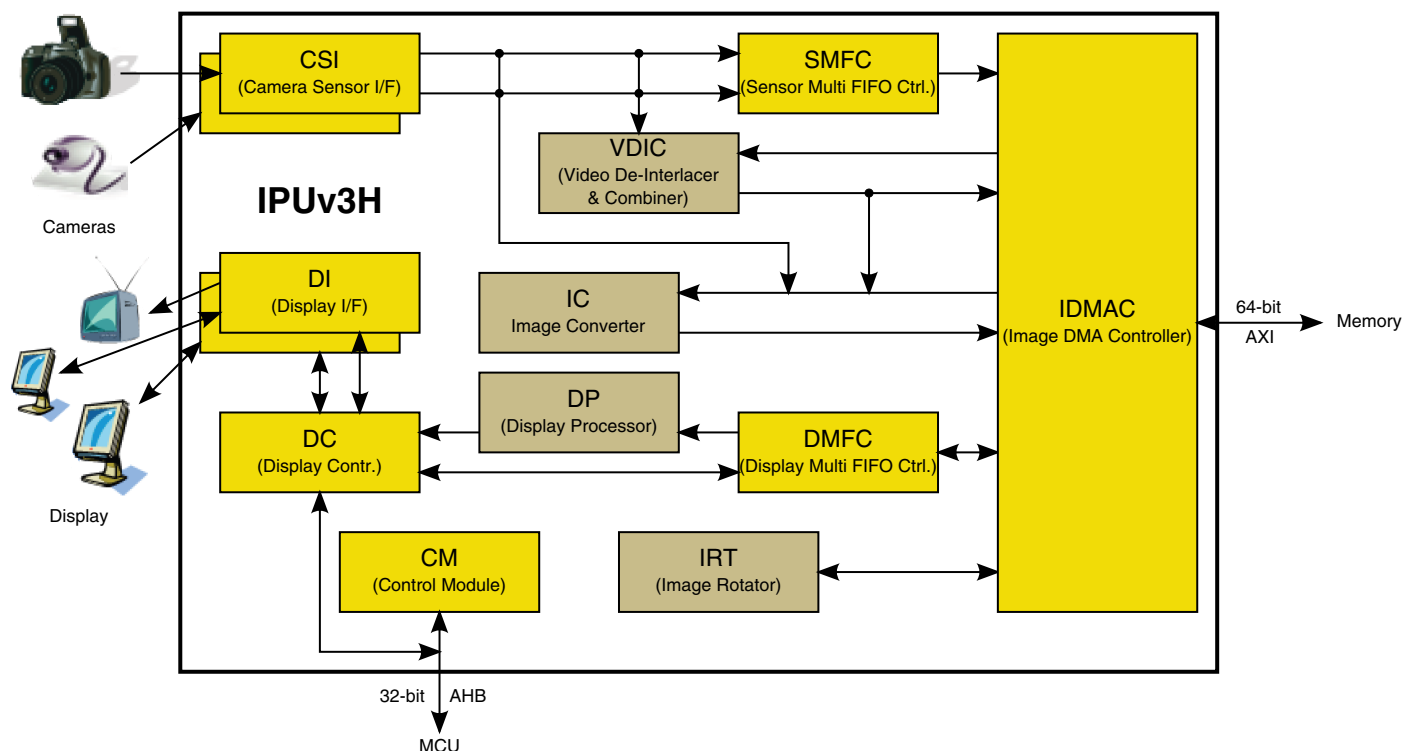

Figure 9-5. IPU - Block Diagram

Table 9-3. IPU - Block Description

| Block | Description |
|---|--|
| CSI - Camera Sensor Interface | Controls a camera port; provides interface to an image sensor or a related device. IPUv3 includes 2 such blocks |
| DI - Display Interface | Provides interface to displays, display controllers and related devices. IPUv3 includes 2 such blocks |
| DC - Display Controller | Controls the display ports. |
| VDIC - Video De-Interlacer and Combiner | Performs de-interlacing - converting interlaced video to progressive - or combining |
| IC - Image Converter | Performs resizing, color conversion/correction, combining with graphics, and horizontal inversion |
| DP - Display Processor | Performs the processing required for data sent to display |
| IRT - Image Rotator | Performs rotation (90 or 180 degrees) and inversion (vertical/horizontal) |
| IDMAC - Image DMA Controller | Controls the memory port; transfers data to/from system memory |
| SMFC - Sensor Multi FIFO Controller | Controls FIFO's for output from the CSI's to system memory |
| DMFC - Display Multi FIFO Controller | Controls FIFO's for IDMAC channels related to the display system |
| CM - Control Module | Provides control and synchronization. |

9.2.1 IPU External Ports

The IPU has the following ports:

- Two camera ports - controlled by a CSI module - providing a connection to image sensors and related devices.
- Two display ports - each controlled by a DI module - providing a connection to displays and related devices.
- Memory port - AXI (AHB V3.0) master, controlled by the IDMAC - providing connection to the system memory.
- AHB-lite slave port, providing connection to the ARM MCU (and to any other master connected to the ARM's cross-bar switch)

9.2.1.1 Camera Ports

The role of these ports is to receive input from video sources (e.g. image sensors) and to provide support for time-sensitive control signals to the camera. (Non-time-sensitive controls - e.g. configuration, reset - are performed by the MCU, through an I2C I/F or GPIO signals).

Each of the camera ports includes the following features:

- Direct connectivity to most relevant external devices.
- Parallel interface - up to 20-bit data bus
- Frame size: up to 8192 x 4096 pixels (including blanking intervals)
- Data formats supported include Raw (Bayer), RGB, YUV 4:4:4, YUV 4:2:2 and grayscale, up to 16 bits per value (component).
- Synchronization - video mode
 - The sensor is the master of the pixel clock (PIXCLK) and synchronization signals
 - Synchronization signals are received using either of the following methods:
 - Dedicated control signals - VSYNC, HSYNC - with programmable pulse width and polarity
 - Controls embedded in the data stream, following loosely the BT.656 protocol, with flexibility in code values and location.
- Synchronization - still image capture
 - The image capture is triggered by the MCU or by an external signal (e.g. a mechanical shutter)
 - Synchronized strobes are generated for up to 6 outputs - the sensor and camera peripherals (flash, mechanical shutter...)
- Additional features
 - Frame rate reduction, by periodic skipping of frames

- Downsizing x2, by skipping rows/columns
- Window-of-interest selection
- Pre-flash - for red-eye reduction and for measurements (e.g. focus) in low-light conditions

Several sensors can be connected to each of the CSI's. Simultaneous functionality (sending data) is supported as follows:

- Two streams can be received independently, each through a different CSI.
- A CSI can receive several interleaved streams (up to 4; e.g. as supported by the MIPI/CSI-2 I/F), The CSI can de-interleave the streams according to an ID signal received with the input.
- Unpacking capabilities are provided for a single stream in each CSI, while the other ones are treated as generic data.
- Only one of the streams can be transferred to the VDIC or IC for on-the-fly processing, while the other ones are sent directly to system memory.

The input rate supported by the camera port is as follows:

- Peak: up to 240 MHz (values/sec)
- Average (assuming 35% blanking overhead), for YUV 4:2:2
 - Pixel in one cycle (e.g. BT.1120): up to 180 MP/sec, e.g. 12M pixels @ 15 fps
 - Pixel on two cycles (e.g. BT.656): up to 90 MP/sec, e.g. 6M pixels @ 15 fps.
- On-the-fly processing may be restricted to a lower input rate - see below.

9.2.1.2 Display Ports

The role of these ports is to communicate with display devices, either directly or through a controller (e.g. graphics accelerator) or a bridge (e.g. TV encoder or an LVDS interface bridge).

9.2.1.2.1 Access Modes

Two access modes are supported:

- Synchronous Access
- Asynchronous Access

9.2.1.2.2 Synchronous Access

In this mode, the IPU transfers a two-dimensional block of pixels to the display device, in synchronization with the screen refresh cycle.

This mode has a dual role:

- For a RAM-less display or a TV screen, this mode is used to perform the screen refresh process from a display buffer in system memory.
- For a "smart" display, this mode is used to transfer a rectangular block of pixels to the display's screen and, in some cases, also to the display buffer

In both cases, the IPU sends to the display all the synchronization signals controlling the screen refresh and the block transfer is synchronized with these signals. This synchronization means that tearing effects are avoided when using this mode.

9.2.1.2.3 Asynchronous Access

This is the main mode used for communicating with an external display controller (possibly in a smart display or a graphics accelerator). In this mode, the IPU performs random access - read/write - to the memory and registers of the controller.

The following access types are provided:

- Data transfer to the external device, after on-the-fly processing in the IPU.
- Data transfer (DMA) - read/write - between the host's system memory and the external device, through the IPU's memory port (controlled by the IDMAC); e.g. transfer of a rectangular block of pixels (possibly full screen).
- Host access - read/write - to an external device, through the AHB-slave port

9.2.1.2.4 Interface details

The display interface is very flexible and supports a wide variety of devices from major manufacturers.

The following interface types are provided (in each of the two display ports):

- A parallel video interface (for synchronous access) - up to 24-bit data bus.
 - Supports BT.656 (8-bit) and BT.1120 (16-bit) protocols
 - Supports HDTV standards SMPTE274 (1080i/p) and SMPTE296 (720p)
- A parallel bidirectional bus interface (for asynchronous access) - up to 32-bit data bus.
- A serial interface - 3-wire, 4-wire and 5-wire (two flavors) (for asynchronous access)

The supported formats for pixel data are: RGB and YUV 4:2:2.

For the interface clock, there are the following options (independently for each port)

- Derived from the IPU internal clock (master mode)
- Provided by an external source (slave mode)

The transfer rate supported

- When a single port is active, the pixel clock rate is up to 264 MHz
- The both ports are active
 - Each pixel clock rate may be up to 220 MHz¹
 - The sum of pixel clock rates is up to 240 MHz

9.2.1.2.5 Connecting To Display Devices

IPU allows the connectivity to multiple display devices.

In particular, it supports the following setup:

- Primary LCD display.
- Second LCD display.
- External display; e.g. TV.

Simultaneous functionality of the above devices is possible in each of the following ways:

- Two devices can be accessed (synchronously or asynchronously) independently, each through a different port: each using any of the available interfaces.
- Two devices can time-share asynchronous accesses through the legacy serial and parallel interfaces, using the CS signals.

9.2.2 Processing

The IPU processes rectangular blocks of pixels. The processing is performed in four modules - VDIC, IC, DP and IRT.

1. Specified pixel clocks frequencies are applicable for internal clocks, but may be limited by IO buffers speed capability. Final numbers are subjected to AC characterization.

(see [Figure 9-5](#) and [Table 9-3](#)). Several time-shared data flows are supported, as described in the following table.

Table 9-4. Time-Shared Data Flows Through The IPU

| Name | Number | Type | Flow | Target | Restrictions |
|------------------------|---|------|---|---|---|
| Display Refresh/Update | 5 flows (at most two of them of type DS1) | DS1 | Fmem -> DP -> Display | Synchronous Access (e.g. display refresh; controlled by the DI) | |
| | | DS2 | Fmem -> DP -> Display | Asynchronous Access (e.g. display update) | |
| | | DS3 | Fmem <-> Display | Generic Data Transfer | |
| | 1 flow | DS4 | MCU <-> Display | Direct Access | |
| Video Playback | 1 flow | PL1 | Bmem -> VDIC -> IC -> Bmem -> IRT -> Fmem + DSx | Main option | |
| | | PL2 | Fmem -> IRT -> Bmem -> IC -> DP | Low power (branching to DSx, as a video plane) | Progressive source Large enough window No other video flows |
| | | PL3 | Fmem -> VDIC -> IC -> DP | Low power (branching to DSx, as a video plane) | Interlaced source Large enough window No other video flows |
| Camera Preview | 2 flows (VF2 may be used also as a playback flow) | VF1 | Sensor -> IC -> Bmem -> IRT -> Fmem + DSx | main option | Single progressive input |
| | | VF2 | Sensor -> Fmem -> VDIC -> IC -> Bmem -> IRT -> Fmem + DSx | two inputs and/or interlaced input | When the VDIC is used for de-interlacing, one of the three input fields can go directly from the sensor to the VDIC |
| | | VF3 | Sensor -> IC -> DP | Low power Smart Display Tearing-less (branching to DS2, as a video plane) | Single progressive input Refresh rate = 2x sensor frame rate Large enough window No other video flows |
| | | VF4 | Sensor -> IC -> Fmem + DS1 | Low power RAM-less Display Single Display Buffer (in internal memory) Tearing-less | Single progressive input Refresh rate = 2x sensor frame rate Large enough window No other video flows |
| Video Record | 2 flows | RCx | IC -> Bmem -> IRT -> Fmem | (branching from VFx) | |
| Graphic Overlays | 2 flows | GF1 | Fmem -> IC | (combining with the main flow) | |
| | 2 flows | GF2 | Fmem -> DP | | |

9.2.2.1 Display Processor (DP)

The Display Processor performs all the processing required for data sent to a display.

- Combining 2 video/graphics planes
- Overlaying a simple HW cursor 32 x 32 pixels, uniform color; may be combined logically with the background.
- Color conversion/correction - linear (multiplicative and additive) Programmable; including:
 - YUV <-> RGB, YUV<->YUV conversions where YUV stands for any one of the color formats defined in the MPEG-4 standard
 - Adjustments: brightness, contrast, color saturation...
 - Special effects: gray-scale, color inversion, sephia, blue-tone...
 - Hue-preserving gamut mapping - for minimal color distortion
 - Applied to the output of combining or to one of the inputs
- Gamma correction and contrast stretching - programmable piecewise-linear map

The DP processes a single data flow at any given time, but it supports up to three data flows, by time sharing, one of them may be synchronous.

The data rate is up to 264M pixels/sec

9.2.2.2 Video de-interlacer (VDIC)

VDIC, the video de-interlacer and combiner module, has two operation modes

- De-interlacing: converts an interlaced video stream to progressive order.
- Combining: combines two video/graphics planes and a background color

The input and output to/from the VDIC is as follows:

- Input for de-interlacing: three consecutive fields
 - Source
 - The most recent field may come from the CSI or from system memory
 - The other two fields are read from memory
 - Field size: Supports up to 1080p
 - Pixel format: YUV 4:2:2/4:2:0, 8 bits/value
 - Typical video sources - SDTV: 480i30 (720x480 at 30 fps) or 576i25 (720x576 at 25 fps) and HDTV: 1080i30 (1920x1080 at 30 fps)
- Input for combining: two progressive video/graphics planes
 - Source: system memory

- Plane size: up to 1920x1200 pixels.
- Pixel format: RGB/YUV 4:2:2, 8 bits/value
- Output: progressive frame
 - Destination: to system memory or to the Image Converter.
 - Frame size: up to 1920x1200 pixels.
 - Rate: up to 240M pixels/sec.
 - Format: same as input format.

De-interlacing is performed using a high-quality 3-field filter, which is motion adaptive:

- For slow motion - retains the full resolution (of both top and bottom fields)
- For fast motion - prevents motion artifacts

VDIC supports a single video stream at any given time.

9.2.2.3 Image Converter (IC)

The Image Converter performs various operations on a video stream.

The operations performed are:

- Resizing:
 - Fully flexible resizing ratio Maximal downsizing ratio: 8:1. Subject to this limitation, any N->M resizing can be performed
 - Independent horizontal and vertical resizing ratios.
- Color conversion/correction - linear (multiplicative and additive) Programmable; including:
 - YUV <-> RGB, YUV<->YUV conversions where YUV stands for any one of the color formats defined in the MPEG-4 standard
 - Adjustments: brightness, contrast, color saturation...
 - Special effects: gray-scale, color inversion, sephia, blue-tone
- Combining with a graphics plane (e.g. application-specific overlay)
- Horizontal inversion

The IC supports three time-shared data flows: record, camera preview and playback (the first two share a common input).

The frame resolution supported is up to 4096x4096 for input and up to 1024x1024 for output. Wider frames can be processed by the IC by splitting them to vertical stripes.

Data throughput:

- For a single active task: up to 240M pixels/sec for input and up to 120M pixels/sec for output.
- For several active tasks: up to 200M pixels/sec for input and up to 100M pixels/sec for output.

9.2.2.4 Image Rotator (IRT)

The Image Rotator performs any combination of the following:

- 90-degree rotation
- Horizontal inversion
- Vertical inversion

The data throughput

- When a single task is active: up to 120M pixels/sec.
- When more tasks are active: up to 100M pixels/sec.

9.2.3 Automatic Procedures

The IPU is equipped with powerful control and synchronization capabilities to perform its tasks with minimal involvement of ARM and minimal use of memory.

In particular, it includes:

- An integrated DMA controller with an AXI master port, allowing autonomous access to the system memory.
- An integrated display controller, performing screen refresh of a RAM-less display.
- A page-flip double buffering mechanism, synchronizing read and write access to system memory, to prevent tearing effects.
- A double/triple buffer synchronization mechanism with a video/graphics source.
- Internal synchronization, e.g., between input from sensor and output to display.

As a result, in most cases, the MCU is involved only when it also performs part of the processing (e.g. video coding). In particular, the following procedures are performed by the IPU completely autonomously:

- Screen refresh for RAM-less displays
- Camera preview (displaying a view finder - a video-stream from the image sensor to the display).

NOTE

Direct camera to display flow is possible when the frame rate of the source and the destination is the same (typically the target display will be asynchronous display, where the display is updated at the rate of the source).

Typically, there are extended periods of time in which there is no other activity in the system. The MCU - being idle - can be put to a low-power mode, reducing the power consumption and extending significantly the battery life.

The IPU supports several techniques to reduce further the power consumption of the display system:

- Dynamic backlight control, with low-light compensation by image enhancement

Further features and capabilities of the automatic procedures include:

- Automatic display of a changing image (animation) or moving image (scrolling).
- The timing of the display update can be adjusted to avoid tearing.
- The video stream from an image sensor can be sent directly to the display buffer used for screen refresh, while avoiding tearing.

The clock sources received by the IPU are listed in the following table.

Table 9-5. IPU Clock Sources

| Name | Symbol | Source | Rate | Comments |
|-----------------------------|--------------------|---|---------------|---|
| High-Speed Processing Clock | HSP_CLK | Clock control Module | Up to 264 MHz | |
| Display Interface Clocks | DI_CLK0 DI_CLK1 | Clock control Module or an external PLL | Up to 220 MHz | Optional; needed for synchronization with interface bridges |

9.2.4 Further Changes in IPUv3H vs. IPUv3M

- The sizes of the input/output FIFOs in the DMFC, SMFC and VDIC have been increased, to support an increased data rate
- The memory address space has been reduced to 32 MB. Direct access to an external display device is canceled, but low-level access is retained.
- Synchronization with the VDOA has been added - see [Synchronization between the VDOA and the IPU](#)

9.3 LVDS Display Bridge (LDB)

LVDS Display Bridge (LDB) will be used to connect the IPU (Image Processing Unit) to External LVDS Display Interface.

9.3.1 LDB Overview

Table 9-6. IP Parametric Table

| Name | IPUv3EX |
|---|---|
| Function | Connectivity to displays with LVDS interface |
| External I/O Pins Notes: Those are LVDS IO pads | LVDS Display port: 2 channels. Each channel consists of: <ul style="list-style-type: none"> • 1 clock pair • 4 data pairs Each pair contains - LVDS special differential pad (PadP, PadM). total of 20 IO pads. |
| SoC Buses | None. Only configuration signals. |
| Interrupts | None |
| DMA Requests | None |
| Number of instantiations | 1 |
| Clock sources and range | DI0_CLK, DI1_CLK- Display interface clock: 20-170 MHz DI0_SER_CLK, DI1_SER_CLK - Serializer clock: 140-595 MHz |

The purpose of the LDB is to support flow of synchronous RGB data from the IPU to external display devices through LVDS interface. This support covers all aspects of these activities:

- Connectivity to relevant devices - Displays with LVDS receivers.
- Arranging the data as required by the external display receiver and by LVDS display standards.
- Synchronization and control capabilities.

9.3.2 LDB External Ports

The LDB has the following ports:

- Two input parallel display ports.
- Two Output LVDS channels - Each channel consisting of 4 data pair, and 1 clock pair (pair=LVDS pad contains PadP, PadM).

- Control signals - to configure LDB parameters and operations.
- Clocks from SOC PLLs.

9.3.3 Input Parallel Display Ports

One or Two (DI0, DI1) parallel RGB input ports are supported (configurable). Only synchronous access mode is supported.

Each RGB data interface contains the following:

- RGB Data of 18 or 24 bits
- Pixel clock
- Control signals: HSYNC, VSYNC, DE, and 1 additional optional general purpose control.

Total of up to 28 bits per data interface are transferred per pixel clock cycle.

Rates supported:

- For dual-channel output: Up to 170 MHz pixel clock (e.g. UXGA - 1600x1200 @ 60 Hz + 35% blanking)
- For single-channel output: Up to 85 MHz per interface. (e.g. WXGA - 1366x768 @ 60 Hz + 35% blanking).

9.3.3.1 Output LVDS Ports

There are 2 LVDS channels. These inputs are used to communicate RGB data and controls to external LCD displays with LVDS interface, or through LVDS receivers.

The LVDS ports may be used as follows:

- One single-channel output
- One dual channel output: single input, split to two output channels
- Two identical outputs: single input sent to both output channels
- Two independent outputs: two inputs sent, each, to a different output channel

9.4 Video Data Order Adapter (VDOA)

The goal of the VDOA is to re-order video data from the "tiled" order used by the VPU to the conventional raster-scan order needed by the IPU.

9.4.1 VDOA Interfaces

The VDOA has the following interfaces

- Memory interface: 64-bit AXI master port (no AXI ID output)
- Host interface: IP slave port
- Synchronization with IPU (see below)

9.4.2 VDOA Data Path

9.4.2.1 Input

- Source: a frame buffer in system memory
- Addressing: tile-based
- Order: raster-scan of tiles
- Maximal bursts (up to 64 bytes)

9.4.2.2 Output

- Destination: a frame buffer or band buffer in system memory (band = row of tiles; to be used when the buffering is in internal memory)
- Addressing: raster-scan of rows
- Order: full bursts of 64 bytes (requires data from several tiles)

Input/output - additional aspects

- Pixel format: YUV 4:2:0 partially-interleaved
- Pixel format: YUV 4:2:2 interleaved
- Total rate: at least up to 220 MP/sec (e.g. 1080i @ 60 fps + 480i @ 60 fps, three fields per frame)
- Frame width: even; up to 4096 pixels
- Frame height: even; up to 2048 pixels
- Addresses [bytes]
 - Base address: 32-bit integer, multiple of 8
 - Offset from the Y buffer to the UV buffer: 23-bit integer, multiple of 8
 - Line stride (same for both buffers): 12-bit integer, multiple of 8

9.4.3 Control

Each VDOA task is activated individually by the CPU and consists of

- Reordering a single buffer of pixels;
- or
- Reordering concurrently three buffers or pixels (needed for the 3 input fields used for de-interlacing in the IPU).

When reordering concurrently three buffers

- The buffers differ only in their base addresses.
- The switching between them is performed at the end of a band (= row of tiles), in a fixed order: buffer 0 band 0 -> buffer 1 band 0 -> buffer 2 band 0 -> buffer 0 band 1...

Multi-tasking

- All task parameters are double buffered, to allow SW-controlled frame-by-frame task-switching without re-configuration overhead.

Synchronization with IPU - see [Synchronization between the VDOA and the IPU](#)

End-of-task interrupt

- The VDOA can issue a functional interrupt after completing the task.
- The interrupt is triggered by the acknowledgement received on the AXI bus for the last write access.
- For this to indicate that the data indeed reached its destination, this last write access is non-bufferable.

9.5 Display Content Integrity Checker (DCIC)

The goal of the DCIC is to verify that a safety-critical information sent to a display is not corrupted.

Such a verification is mandatory for warning icons in the instrument cluster of a car, to comply with the ASIL B (Automotive Safety Integrity Level B) specification. It is also required in other safety-sensitive systems.

9.5.1 DCIC Interfaces

The DCIC has the following interfaces

- Data input port - snooping one of the display ports
- Host interface: IP slave port

9.5.2 DCIC Data Path

See [Figure 9-2](#) for DCIC integration in i.MX 6Dual/6Quad SoC.

Input - snooped display bus

- Pixel clock signal; up to 264 MHz
- Data enable signal: marking a cycle with valid data (pixel)
- Data: 24-bit bus, assumed to contain a single full pixel
- Vsync & Hsync signals: indicating frame & row boundaries respectively
- Mask signal (see below)

Actions

- Identify pixels belonging to a ROI (Region Of Interest)
 - Up to 16 ROIs are supported
 - Each is confined to a rectangle, with a configurable location and size
 - A refined shape of the ROI is characterized through the mask input signal, when enabled
 - Overlap between the regions is not allowed (each pixel contributes to at most one region)
- Calculate an integrity signature - CRC32 - independently for each ROI
- Compare the calculated signature to the reference signature - provided by the host CPU
- This check is triggered by the Vsync signal

Results

- Registered values - accessible by the CPU through the host interface
 - Calculated signatures - one for each ROI - from the last frame (the intermediate values from the current frame are stored separately)
 - Match status bits - one for each ROI - from the last frame
- Interrupts - to the host CPU (maskable)
 - Match results ready (functional)

- Mismatch (error)
- Both interrupts are generated immediately after completing the signature match check
- Signal to an external CPU (through a GPIO pin)
 - Continuously oscillating at a rate which is an integer division of the input clock
 - When the status bit of the mismatch interrupt is set - i.e. from mismatch detection until the CPU clears the bit: division x16
 - Otherwise: division x4

9.5.3 Configuration parameters

- For each of the 16 ROIs
 - Enable bit; double-buffered; changes take effect at frame boundaries.
 - Rectangle offset [pixels] = location of the upper-left pixel
 - Horizontal: 0 .. $2^{13}-1$
 - Vertical: 0 .. $2^{12}-1$
 - Rectangle size [pixels]
 - Horizontal: 1 .. 2^{13}
 - Vertical: 1 .. 2^{12}
 - A 32-bit "reference signature" - to be compared with the calculated signature
 - Freeze bit
 - "Sticky" control bit: zero at reset; can be set but cannot be reset
 - Once set (typically at boot), the only parameters from the above list that are allowed to be changed are the reference signatures
- Mask input settings: enable, polarity
- Interrupt settings
 - A mask bit for each of the two interrupts
 - Freeze bit: the masks can be changed only before the freeze bit is set.

9.5.4 System Considerations

- The DCIC always assumes a 24-bit pixel.
- For proper functionality with lower color depth, one must ensure that:
 - When the CPU calculates the reference signature, it applies the same mapping of a pixel to a 24-bit field as that performed by the IPU.
 - The display is connected to the appropriate pins.
 - The simplest mapping would be

- Map the pixel to the data bus in the same way as for 24 bpp
- Set the values at the extra LSBs to zero.
- Parameter updates
 - The reference signature can be freely updated from frame to frame, in coordination with the changing content (since it is used only once per frame, just before the interrupt)
 - Each ROI can be freely and independently enabled/disabled between frames (since the enable bit is double buffered)
 - The size and location of a ROI can be modified while it is disabled.

9.6 Video Processing Unit (VPUv6)

The VPU is a multi-standard video codec (encoder/decoder) capable of handling multiple streams simultaneously by time multiplexing.

It is a very flexible block consisting of hardware accelerators surrounding a programmable core. The VPU presents to the system a register mapped interface that is controlled by the embedded processor. End users should only interface with the VPU using the API that is provided with each BSP Programmers User Guide. This API isolates the user from possible changes in the register level interface.

In the following table we can see a summary of the VPU specs. The VPU has its own DMA driven AXI masters that allow it to retrieve the required data directly from system memory (DDR and iRAM). The load in the host ARM platform is negligible because it only needs to interact with the VPU at the frame level.

Table 9-7. VPU Spec Summary

| Name | VPU |
|--------------------|---|
| Function | Decode video streams including optional video processing such as rotation, deringing and mirroring. |
| Supported encoders | MPEG-4 SP H.263 V2 + Annex J, K (RS=0 and ASO=0), and T H.264 BP, CBP MJPEG Baseline |

Table continues on the next page...

Table 9-7. VPU Spec Summary (continued)

| Name | VPU |
|--|--|
| Supported decoders | MPEG-2 MP, HP VC-1 SP, MP, AP MPEG-4 SP, ASP H.263 V2 + Annex J, K (RS=0 and ASO=0), and T H.264 BP, MP, HP H.264-MVC BP, MP, HP DivX v3,4,5 Real Video 8, 9, 10 MJPEG Baseline On2 VP8 AVS Jizhun |
| External I/O Pins (List, Type, Schmidt Trigger, Speed) | No external I/O pins are needed |
| SoC Buses (List, Type, Bandwidth) | 64 bit AXI master for accessing the system memory and the optional secondary AXI but to iRAM IPBus slave for host control |
| Interrupts | Two interrupts |
| DMA Requests | Integrated DMA controller on the AXI master port |
| Endianness | 64 and 32 bit BE/LE |
| Number of instantiations | 1 |
| Clock sources and range | Core clock: up to 264 MHz AXI bus clock: up to 264 MHz IP bus clock: up to 66 MHz |

NOTE

RealNetworks video codec is disabled by default on i.MX 6 series processors. Please contact your FSL sales representative for more details.

The i.MX 6Dual/6Quad processor has a high-performance video processing unit (VPU), which covers many standard and high definition video decoders and encoders as a multi-standard video codec engine as well as several important video processing such as rotation and mirroring.

9.6.1 Basic Structure

The following [Figure 9-6](#) shows the basic structure of the VPU. The VPU is self contained except for memory accesses. It is connected to the memory subsystem through two AXI master ports. The ARM configures the VPU operation through the IP bus that is converted to APB in a gasket.

A new feature is added for allowing VPU encoding a frame even the IPU writes only a small portion of source video (from camera sensor) into the frame buffer. This feature is called IPU-VPU sub-frame synchronization. Four additional signals are added for implementing this feature with three of them from IPU to VPU, and one of them from VPU to IPU, as shown in [Figure 9-6](#) for the signal category of "IPU VPU sub-frame sync"

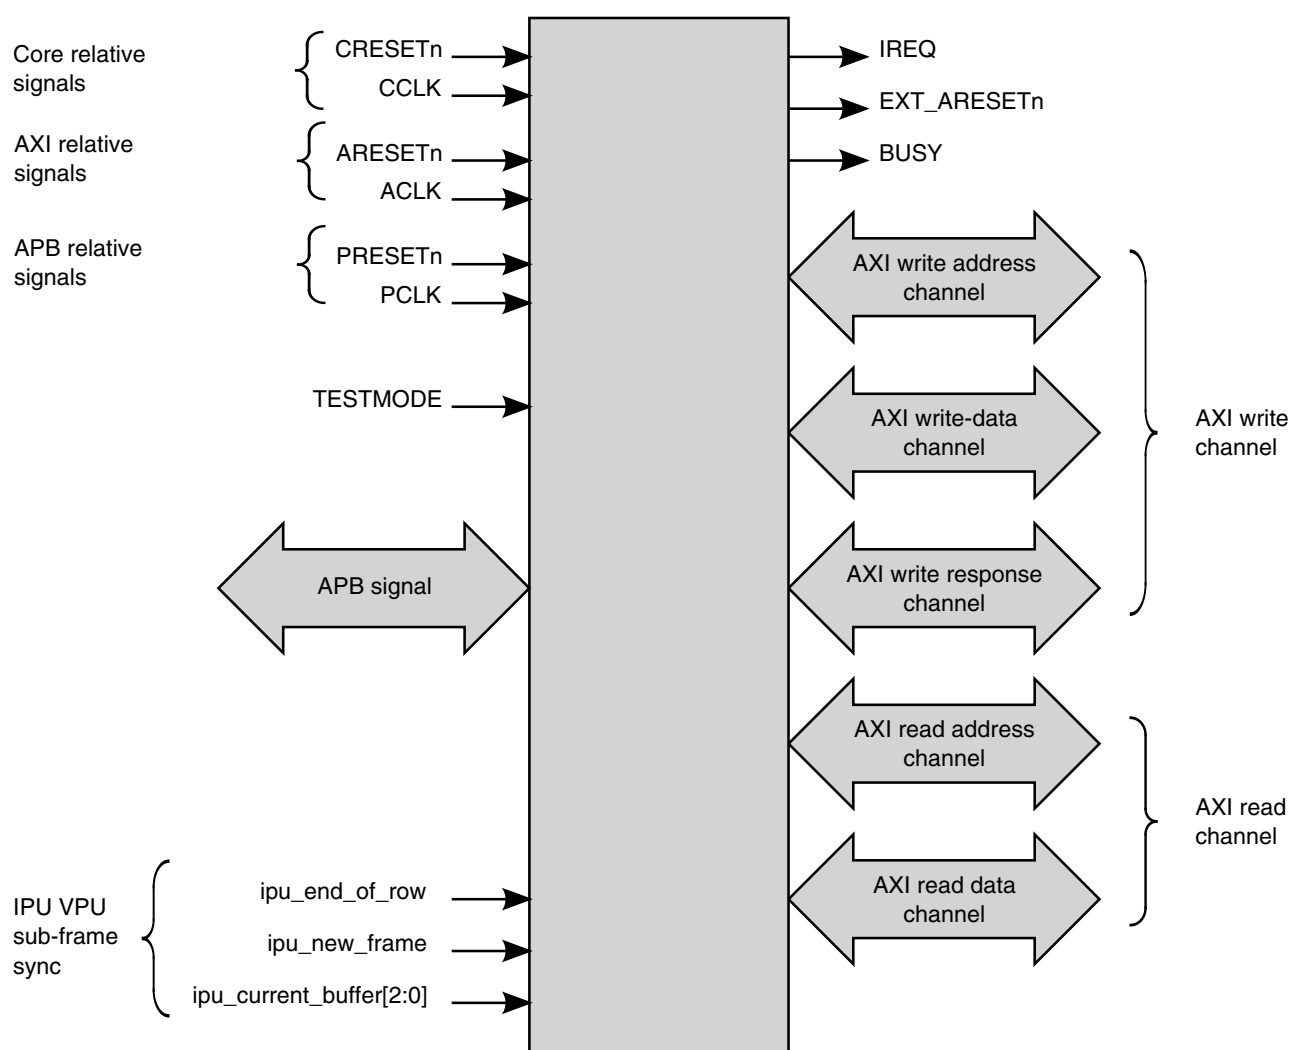

Figure 9-6. The Block Diagram of the VPU

9.6.2 Feature summary

The following table describes the VPU's encoding / decoding capabilities:

Table 9-8. VPU decoding/encoding capabilities

| Dec/Enc | Standard | Profile | Resolution | Bitrate | Comments |
|------------------|------------|----------------|------------------|----------------------------|---|
| HW Decoder | MPEG-2 | Main-High | 1080 i/p, 30fps | 50 Mbps | 1080p+SD at 30fps, 720p60 |
| | MPEG4/XviD | SP/ASP | 1080 i/p, 30fps | 40 Mbps | — |
| | H.263 | P0/P3 | 16CIF, 30 fps | 20 Mbps | — |
| | H.264 | BP/CBP/MP/HP | 1080 i/p, 30 fps | 50 Mbps | 1080p+SD at 30 fps, 720p60 |
| | H.264-MVC | BP/MP/HP | 720p, 30 fps | — | — |
| | VC1 | SP/MP/AP | 1080 i/p, 30 fps | 45 Mbps | 1080p+SD at 30 fps, 720p60 |
| | RV | 8/9/10 | 1080 p, 30 fps | 40 Mbps | — |
| | DivX | 3/4/5/6 | 1080 i/p, 30 fps | 40 Mbps | — |
| | On2 VP6 | — | 720p, 30 fps | 20 Mbps | — |
| | On2 VP8 | — | 720p, 30 fps | 20 Mbps | — |
| | Theora | — | 720p, 30 fps | 20 Mbps | — |
| | Jizhun | 1080 i/p, 30fp | 40 Mbps | — | — |
| AVS | | | | | |
| MJPEG | Baseline | 8192x8192 | 120 Mpixel/sec | Perf shown at 4:4:4 format | — |
| Hardware encoder | MPEG4 | Simple | 720p, 30 fps | 12 Mbps | VPU can generate higher bitrate than the maximum specified by the corresponding standard. |
| | H.263 | P0/P3 | 4CIF, 30 fps | 8 Mbps | |
| | H.264 | BP/CBP | 1080p, 30 fps | 14 Mbps | |
| | MJPEG | Baseline | 8192 x 8192 | 160 Mpixel/sec | Perf shown at 4:2:2 format |

VPU can also perform the following:

- On-the-fly (90 x n) degree simultaneous rotation and mirroring (n = 0,1,2,3).
- Post-processing
 - De-blocking filtering for MPEG-4
 - De-ringing filtering for MPEG-4 and H.264 decoder

9.7 OpenGL ES 3D Graphics Processing Unit (GPU3Dv4)

9.7.1 OpenGL Overview

9.7.2 OpenGL Features

Summary of features in the GPU3D includes:

- OpenGL ES 2.0 compliance, including extensions; OpenGL ES 1.1; OpenVG 1.1
- IEEE 32-bit floating-point pipeline
- Ultra-threaded, unified vertex and fragment shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 12 programmable elements per vertex
- Dependent texture operation with high-performance
- Alpha blending
- Depth and stencil compare
- Support for 8 fragment shader simultaneous textures
- Support for 4 vertex shader simultaneous textures
- Point sampling, bi-linear sampling, tri-linear filtering, and cubic textures
- Resolve and fast clear
- 8k x 8k texture size and 8k x 8k rendering target

9.7.3 OpenGL Block Diagram

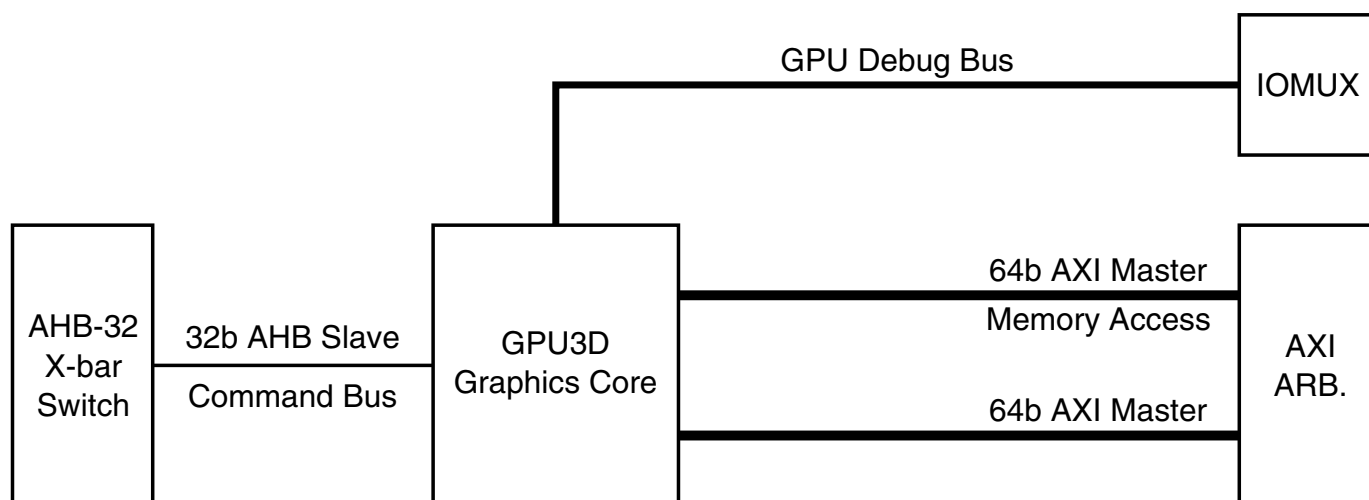

Figure 9-7. GPU System Integration Diagram

9.7.4 OpenGL Performance

- Geometry Rate: 88M Triangles/sec
- Pixel Rate: 1.066G pixels/sec

9.7.5 OpenGL Software

API / Driver Support

- OpenGL ES 1.1, 2.0
- OpenVG 1.1
- EGL 1.4
- OpenGL 2.1
- OpenCL 1.1 EP
- OpenVG 1.1

Operating Systems

- Windows CE
- Linux Embedded and X11
- Android

9.8 2D Graphics Processing Unit (GPU2Dv2)

9.8.1 2D feature summary

GPU2D has the following features:

- Bit BLT & stretch BLT
- Rectangle fill and clear
- Line drawing
- High performance stretch and shrink
- Mono expansion for text rendering
- ROP2, ROP3, and ROP4
- Alpha blending including Java 2 Porter-Duff compositing blending rules
- Support rendering size of 32Kx32K
- 90/180/270 degree rotation
- Transparency by monochrome mask, chroma key, or pattern mask

- Color space conversion between YUV and RGB
- High quality image scaling, using up to 9x9 separable filter
- Bit-Blit Formats
 - A1R5G5B5 (source/destination)
 - A4R4G4B4 (source/destination)
 - X1R5G5B5 (source/destination)
 - X4R4G4B4 (source/destination)
 - R5G6B5 (source/destination)
 - X8R8G8B8 (source/destination)
 - A8R8G8B8 (source/destination)
 - 8-bit color index (source only)
 - A8 (source/destination)
 - 1-bit monochrome (source only)
- Filter Blit Formats
 - A1R5G5B5 (source/destination)
 - A4R4G4B4 (source/destination)
 - A8R8G8B8 (source/destination)
 - R5G6B5 (source/destination)
 - X1R5G5B5 (source/destination)
 - X4R4G4B4 (source/destination)
 - X8R8G8B8 (source/destination)
 - YUV (source only):
 - NV12 (4:2:0, 2 planes)
 - NV16 (4:2:2, 2 planes)
 - UYVY (4:2:2, interleave)
 - YUY2 (4:2:2, interleave)
 - YV12 (4:2:0, 3 planes)
 - 8-bit color index(source only)

9.8.2 2D Block Diagram

Figure 9-8 below presents the integration of the GPU2D core in i.MX 6Dual/6Quad SoC.

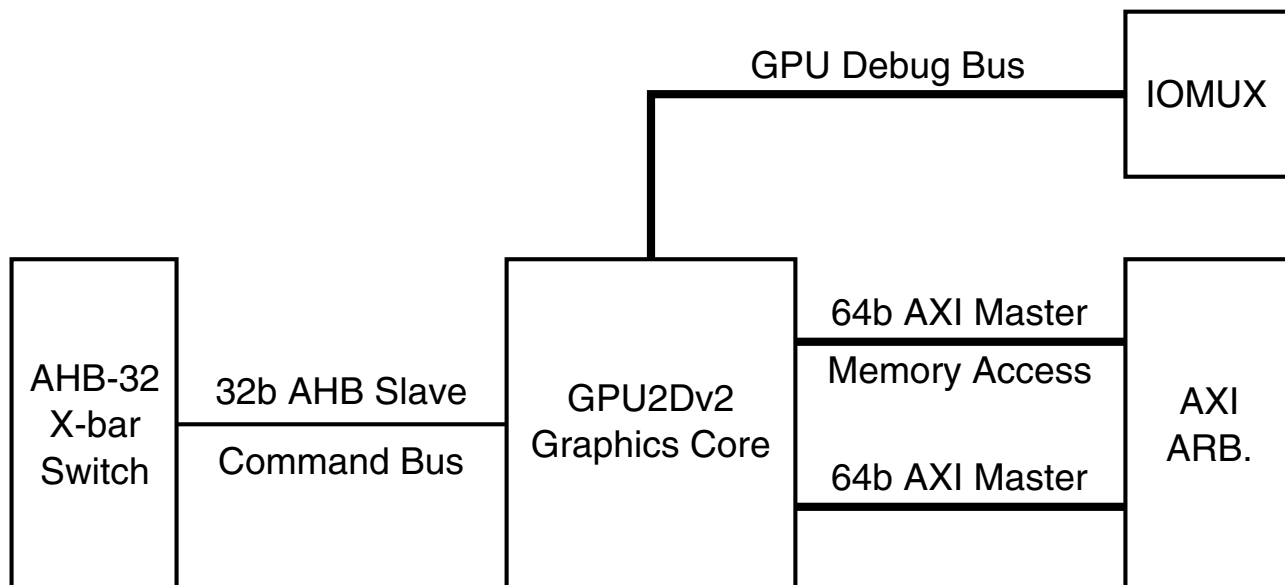

Figure 9-8. GPU2Dv2 (GPU2D) Interface Diagram

9.8.3 2D Performance

- Geometry Rate: 26.6M Triangles/sec
- Pixel Rate: 256M pixels/sec

9.8.4 2D Software

API / Driver Support

- GDI/DirectDraw
- DirectFB
- X11 EXA

Operating Systems

- Windows CE
- Linux Embedded and X11
- Android

9.9 Vector Graphics Processing Unit (GPUVGv2)

9.9.1 Vector Graphics Overview

The vector graphics processing unit (version 2) is based on the GC355 IP core.

9.9.2 Vector Graphics Features

Featureset Overview:

- Real-time hardware curve tessellation of lines, quadratic and cubic Bezier curves
- 16x Line Anti-aliasing
- OpenVG 1.1 support
- Vector Drawing:
 - Coordinate Systems and Transformations
 - Viewport Clipping, Scissoring and Alpha Masking
 - Paths and stroke generation
 - Image interpolation
 - Image Filters
 - Paint (gradient and pattern)
 - Blending

Figure 9-9 below presents the integration of OpenVG core, in i.MX 6Dual/6Quad SoC.

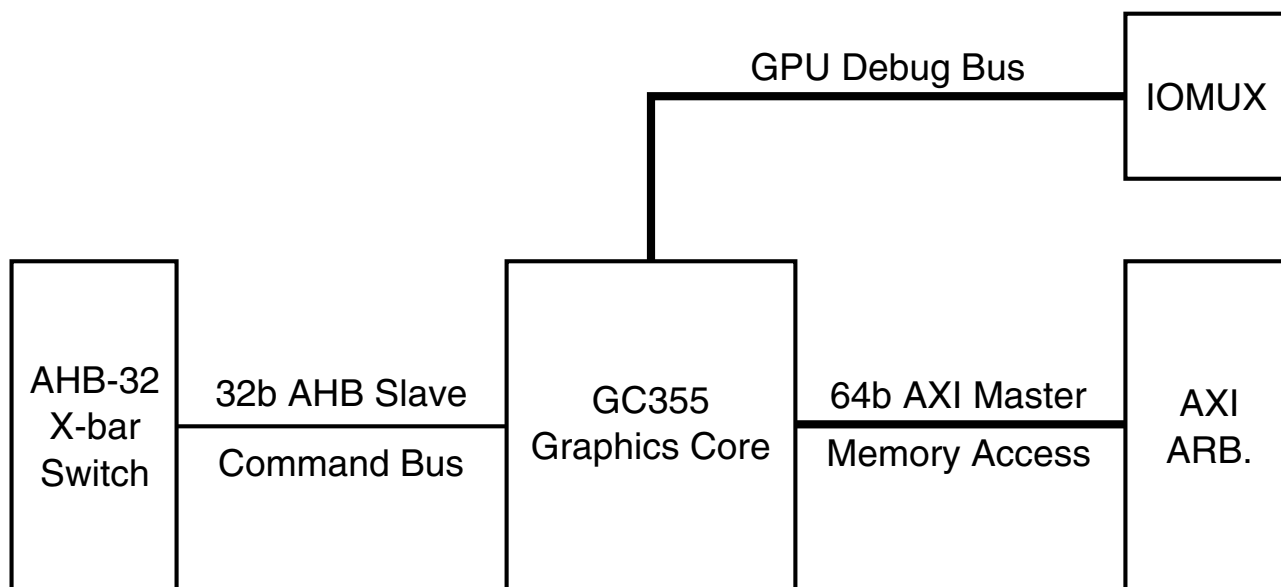

Figure 9-9. GPU2Dv2 (GC355) Interface Diagram

9.9.3 Vector Graphics Performance

- GPU-VG @ 533MHz
- Full OpenVG 1.1 Khronos Conformance
- 533 M pixels / sec raw performance (1 pixel / clock)

9.9.4 Vector Graphics Software

API / Driver Support

- OpenVG 1.1

Operating Systems

- Windows CE
- Linux Embedded and X11

9.10 HDMI TX - HD Multimedia Interface transmitter

9.10.1 HDMI Introduction

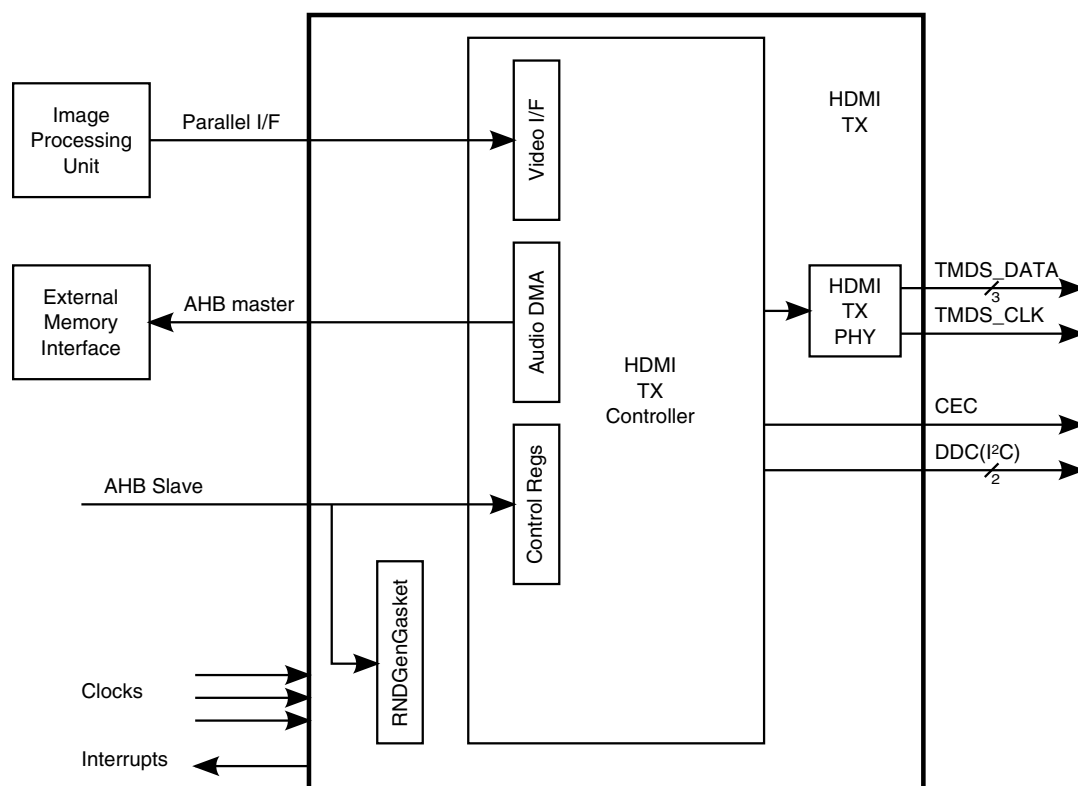

HDMI (High-Definition Multimedia Interface) is a compact audio/video interface for transmitting uncompressed digital video data and uncompressed/compressed digital audio data. HDMI connects digital audio/video sources—such as set-top boxes, Blu-ray Disc players, personal computers (PCs), video game consoles, and AV receivers to compatible digital audio devices, computer monitors, and digital televisions.

HDMI supports, on a single cable, any TV or PC video format, including standard, enhanced, and high-definition video, up to 8 channels of digital audio, and a Consumer Electronics Control (CEC) connection. The CEC allows HDMI devices to control each other when necessary and allows the user to operate multiple devices with one remote control handset.

Because HDMI is electrically compatible with the signals used by Digital Visual Interface (DVI), no signal conversion is necessary, nor is there a loss of video quality when a DVI-to-HDMI adapter is used.

The HDMI Transmitter (HDMI TX) consists of two parts:

- Figure 9-10 depicts the HDMI TX integration scheme into the i.MX 6Dual/6Quad.

The video interface is parallel with 24 bit/pixel data and separate signals for vertical (VSYNC) and horizontal (HSYNC) synchronization. The video data is supplied by the Image Processing Unit (IPU).

9.10.2 Features

Freescale Semiconductor, Inc. 501

Table 9-9. HDMI TX Features

| Specification item | Requirement |
|-----------------------------|---|
| General Features | |
| Standard Compliance | HDMI 1.4a HDMI CTS 1.4a DVI 1.0 HDCP 1.4 |
| Consumer Electronic Control | Supported |
| Monitor Detection | Hot plug/unplug detection and link status monitor supported |
| Video Features | |
| Video Standard Compliance | EIA/CEA-861D |
| Supported Video Resolutions | Up to 1080p@120Hz HDTV display, up to QXGA graphics display, HDMI 1.4a 4K x 2K video formats HDMI 1.4a 3D video modes with up to 340MHz TMDS clock |
| Pixel Clock Frequency | From 25 MHz to 340 MHz |
| Input Data Formats | Parallel YCbCr 4:4:4 and parallel RGB 4:4:4 and parallel YCbCr 4:2:2 |
| Input Color Depth | 24/30/36/48 bits/pixel |
| Input Syncs Format | Separate HSYNC and VSYNC plus data enable control |
| Internal Video Processing | Interpolation YCbCr 4:2:2 to 4:4:4 Color space conversion YCbCr to RGB and vice versa |
| Audio Features | |
| Audio Standard Compliance | IEC60958, IEC61937 |
| Supported Audio Formats | All audio formats as specified by the HDMI Specification Version 1.4a supported. |
| Audio Input Interfaces | Audio DMA |
| Audio Sampling Rate | Up to 192 kHz |

9.11 Display / Sensor MIPI interfaces

9.11.1 Introduction

i.MX 6Dual/6Quad Application Processor features MIPI DSI/CSI-2 interfaces that includes:

- MIPI DSI Host controller with associated MIPI D-PHY Tx (One clock lane, two Data lanes)
- MIPI CSI-2 Host controller with associated MIPI D-PHY Rx (one clock lane, four Data Lanes)

9.11.2 DSI

DSI is a high performance serial interconnect bus for mobile applications connecting display system to the host system.

Table 9-10. DSI Parametric Table

| Name | DSI |
|--|--|
| Function | High speed serial interface controller for MIPI Display interface |
| Supported standard version | MIPI DSI Compliant DSI Version 1.01 DPI Version 2.0 DBI Version 2.0 DCS Version 1.02 PPI for D-PHY MIPI D-PHY Version 1.0 |
| External I/O Pins (List, Type, Schmidt Trigger, Speed) | Analog at chip boundary: DATAP[1:0] DATAN[1:0] CLKP CLKN Supplies AVDD -2.5V general analog supply AVDDREF - 2.5V analog supply for D-PHY reference source (low noise) should be directly connected to package ball VDD - 1.1V digital supply GND |
| SoC Buses (List, Type, Bandwidth) | Synchronous Pixel Interface (DPI) Display Bus Interface (DBI) IPB slave interface x 32 bit PPI to D-PHY |
| Interrupts | 1 |
| DMA Requests | N/A |
| Num of instantiations | 1 |
| Clock sources and range | AHB clock (132MHz) Reference clock for Tx D-PHY - 6 ... 27 MHz |

There is one instance of DSI port in the i.MX 6Dual/6Quad application processor. This interface support from 80 Mbps up to 1 Gbps speed per data lane. The DSI Receiver core can manage one clock lane and up to 4 data lanes through the lane management, however two data lanes are implemented in the transmitter D-PHY, therefore the maximum throughput of display port is 2Gbps.

DSI host core is capable of supporting a variety of resolutions and formats:

- Resolution:
 - QQVGA
 - QCIF, QVGA
 - CIF
 - VGA
 - WVGA
 - SVGA
 - XVGA
- Pixel format:
 - RGB565
 - LRGB565
 - RGB666
 - RGB888

The DSI can support both command and video modes and up to four virtual channels to accommodate multiple displays.

- Command and video mode support (type 1, 2, 3, and 4 display architecture)
- Mode switching: low power and ultra low power
- Burst mode: dual video channel
- Non-burst mode: single video channel
- Bus turnaround
- Fault error recovery scheme

DPI and DBI could coexist in the system but only one of them could be active in a certain time moment

9.11.3 CSI-2

CSI-2 is a high performance serial interconnect bus for mobile applications connecting camera sensors to the host system.

Table 9-11. CSI Parametric Table

| Name | CSI-2 |
|--|--|
| Function | High speed serial interface controller for MIPI sensor interface |
| Supported standard version | MIPI CSI-2 Version 1.0 MIPI PPI interface for D-PHY MIPI D-PHY Version 1.0 |
| External I/O Pins (List, Type, Schmidt Trigger, Speed) | Analog at chip boundary: DATAP[3:0] DATAN[3:0] CLKP CLKN Supplies AVDD -2.5V general analog supply AVDDREF - 2.5V analog supply for D-PHY reference source (low noise) should be directly connected to package ball VDD - 1.1V digital supply GND |
| SoC Buses (List, Type, Bandwidth) | Synchronous Pixel Interface - 32 bit, data formatting compliant to CSI-2 specification IPS slave interface x 32 bit |
| Interrupts | 2 |
| DMA Requests | N/A |
| Num of instantiations | 1 |
| Clock sources and range | AHB clock (132 MHz) |

There is one instance of CSI-2 port in the i.MX 6Dual/6Quad application processor. This interface support from 80 Mbps up to 1 Gbps speed per data lane. The CSI-2 Receiver core can manage one clock lane and up to four data lanes through the lane management and de-packetization, providing a maximum throughput of 4 Gbps transfer rate.

9.11.4 D - PHY

D-PHY serves as physical layer for both MIPI DSI and CSI-2 interfaces.

D-PHY Transceiver unit is responsible for transmission and reception of data in High speed (HS) or Low Power (LP) mode. High speed mode is used for high-speed data transmission while the low power mode used for the control purpose. Point-to-point lane interconnect can be used for either data or clock signal transmission. High speed receiver is a differential line receiver while low- Power receiver is an un-terminated, single-ended receiver circuit.

Table 9-12. D-PHY Parametric Table

| Name | D-PHY TX, D-PHY RX |
|--|---|
| Function | MIPI D-PHY dual mode transceiver |
| Supported standard version | D-PHY specification v1.0 |
| External I/O Pins (List, Type, Schmidt Trigger, Speed) | One differential pair per lane. See CSI-2 and DSI parametric tables |
| SoC Buses (List, Type, Bandwidth) | PPI i/f |
| Interrupts | |
| DMA Requests | N/A |
| Num of instantiations | 8 - 3 in DSI interface and 5 in CSI-2 interface |
| Clock sources and range | Reference clock - 6...27MHz |

A single lane module is shown in the figure below.

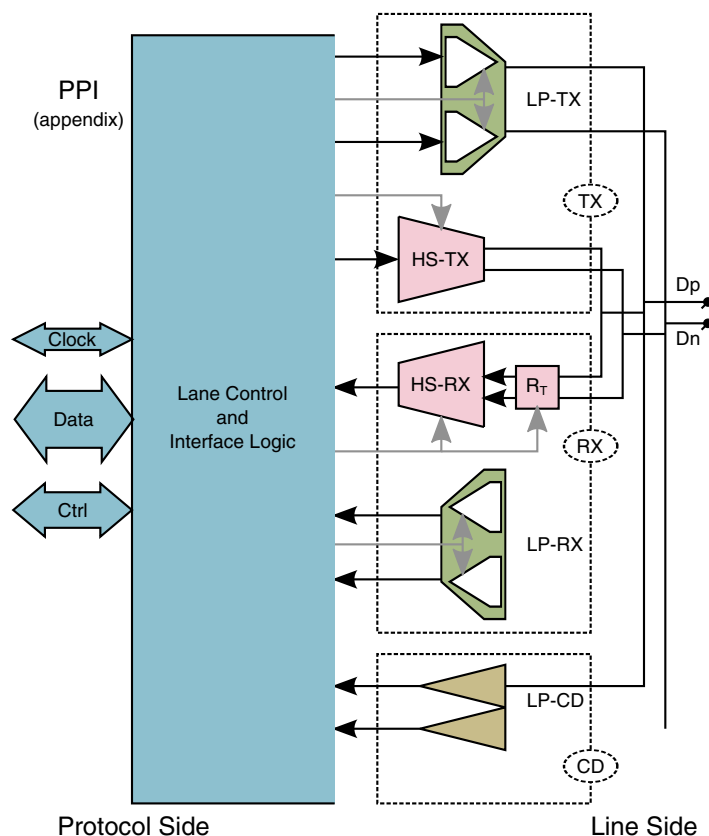

Figure 9-11. Single lane D-PHY- Block Diagram.

There is one instance of D-PHY TX (hard macro; two data lanes, one clock lane, PLL) and one instance of D-PHY RX (hard macro: four data lanes, one clock lane, no PLL) in i.MX 6Dual/6Quad.

9.12 Audio subsystem

The audio subsystem consists of the following modules: SSI-1, SSI-2, SSI-3, AUDMUX, ESAI, SPDIF, ASRC, and MLB. In addition, the IOMUX must be appropriately configured to get signals in and out of the chip.

[Audio subsystem module overview](#) provides an overview of each of the audio subsystem component modules, followed by a module-specific section.

9.12.1 Audio subsystem module overview

The following figure shows a high level block diagram of the audio subsystem.

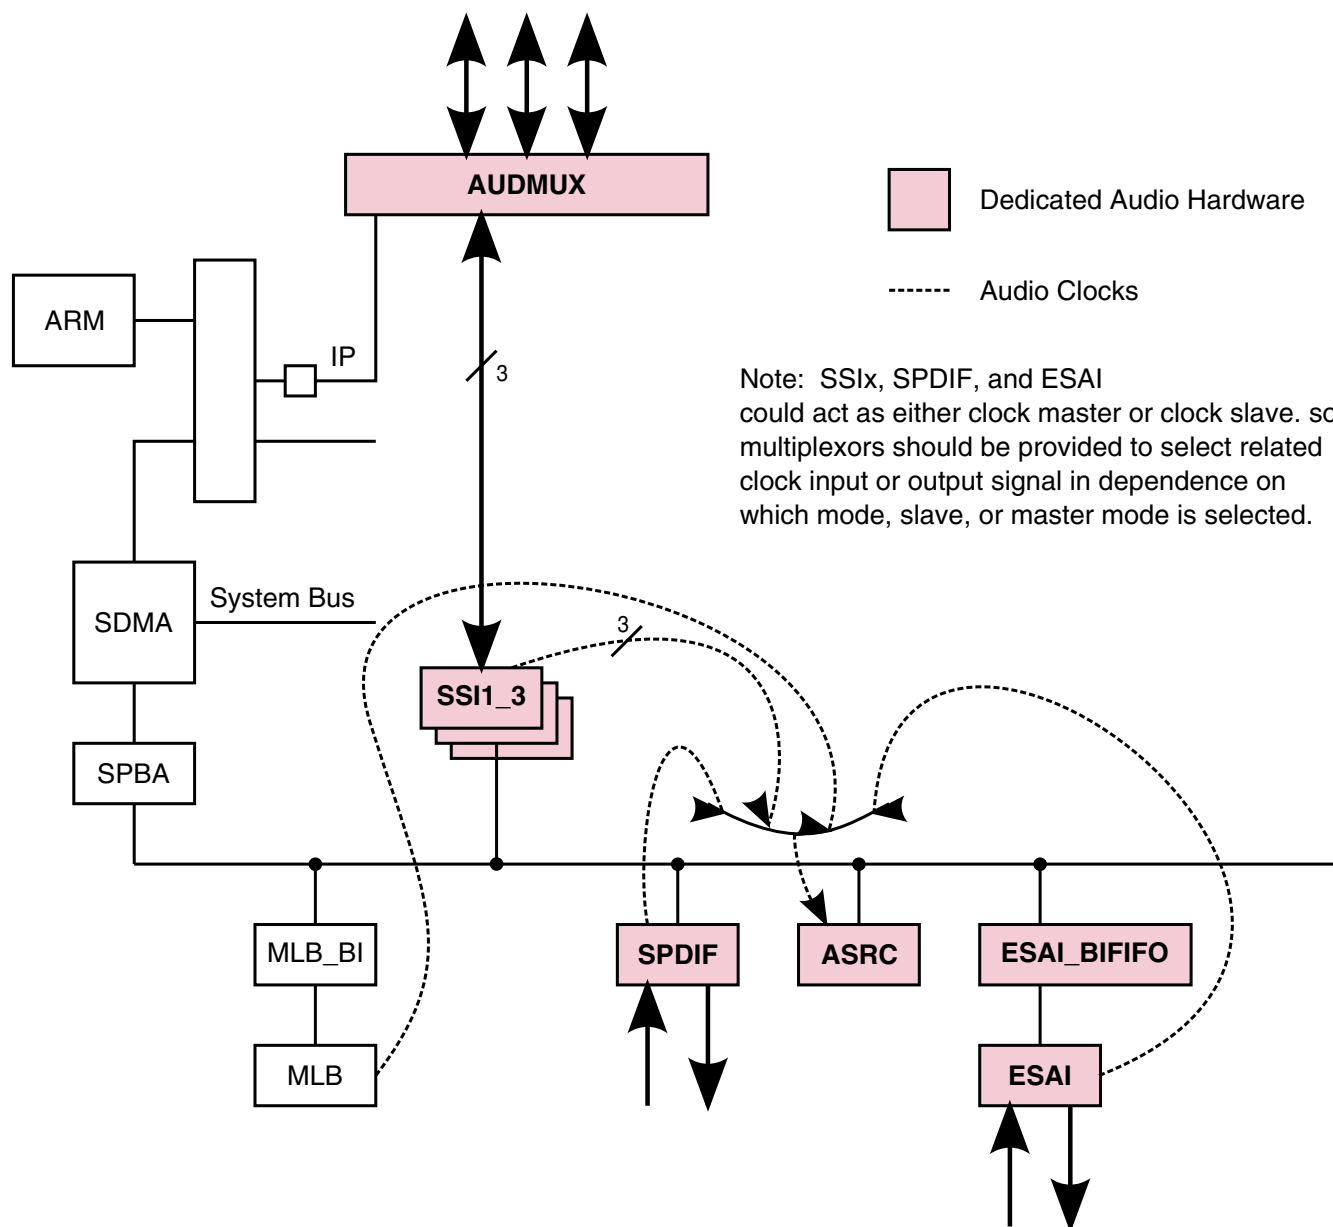

Figure 9-12. Audio subsystem block diagram

SSI1–3 are synchronous serial interfaces used to transfer audio data. SSI1–3 are on the shared peripheral bus. Instead of connecting to the IOMUX directly, their serial lines connect to the digital audio mux (AUDMUX).

AUDMUX provides flexible, programmable routing of the serial interfaces (SSI1, SSI2, or SSI3) to and from off-chip devices. AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself. The ARM controls AUDMUX, but AUDMUX can route data even when the ARM is in a low-power mode.

ESAI (enhanced serial audio interface) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors. ESAI consists of independent transmitter and receiver sections, and each section has its own clock generator. ESAI is connected to the IOMUX and to the ESAI_BIFIFO module.

ESAI_BIFIFO (ESAI bus interface and FIFO) is the interface between the ESAI module and the shared peripheral bus. It contains the FIFOs used to buffer data to and from ESAI. It also provides the data word alignment and padding necessary to match the 24-bit data bus of the ESAI to the 32-bit data bus of the shared peripheral bus.

The SPDIF (Sony/Philips digital interface) audio module is a stereo transceiver that allows the processor to receive and transmit digital audio over it. The SPDIF receiver section includes a frequency measurement block that allows the precise measurement of an incoming sampling frequency. A recovered clock is provided by the SPDIF receiver section and may be used to drive both internal and external components in the system. SPDIF is connected to the shared peripheral bus.

ASRC (asynchronous sample rate converter) converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. ASRC supports concurrent sample rate conversion of up to 10 channels of over 120dB THD+N. The sample rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. ASRC supports up to 3 sampling rate pairs. ASRC is connected to the shared peripheral bus.

9.12.2 Synchronous Serial Interface (SSI)

The Synchronous Serial Interface (SSI) is a full-duplex serial port that allows communication with external devices using a variety of serial protocols. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock/frame sync options.

The SSI has two pairs of 15x32 FIFOs and hardware support for an external DMA controller in order to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream which reduces CPU overhead in use cases where two timeslots are being used simultaneously.

The three SSIs may support three audio streams (possibly at different sample rates) simultaneously. SSI1, SSI2 and SSI3 are located on the Shared Peripheral Bus. Since the SDMA can directly access SSI1...SSI3 (being on the Shared Peripheral Bus), they can be used for high-bandwidth data transfers in order to optimize bus bandwidth consumption.

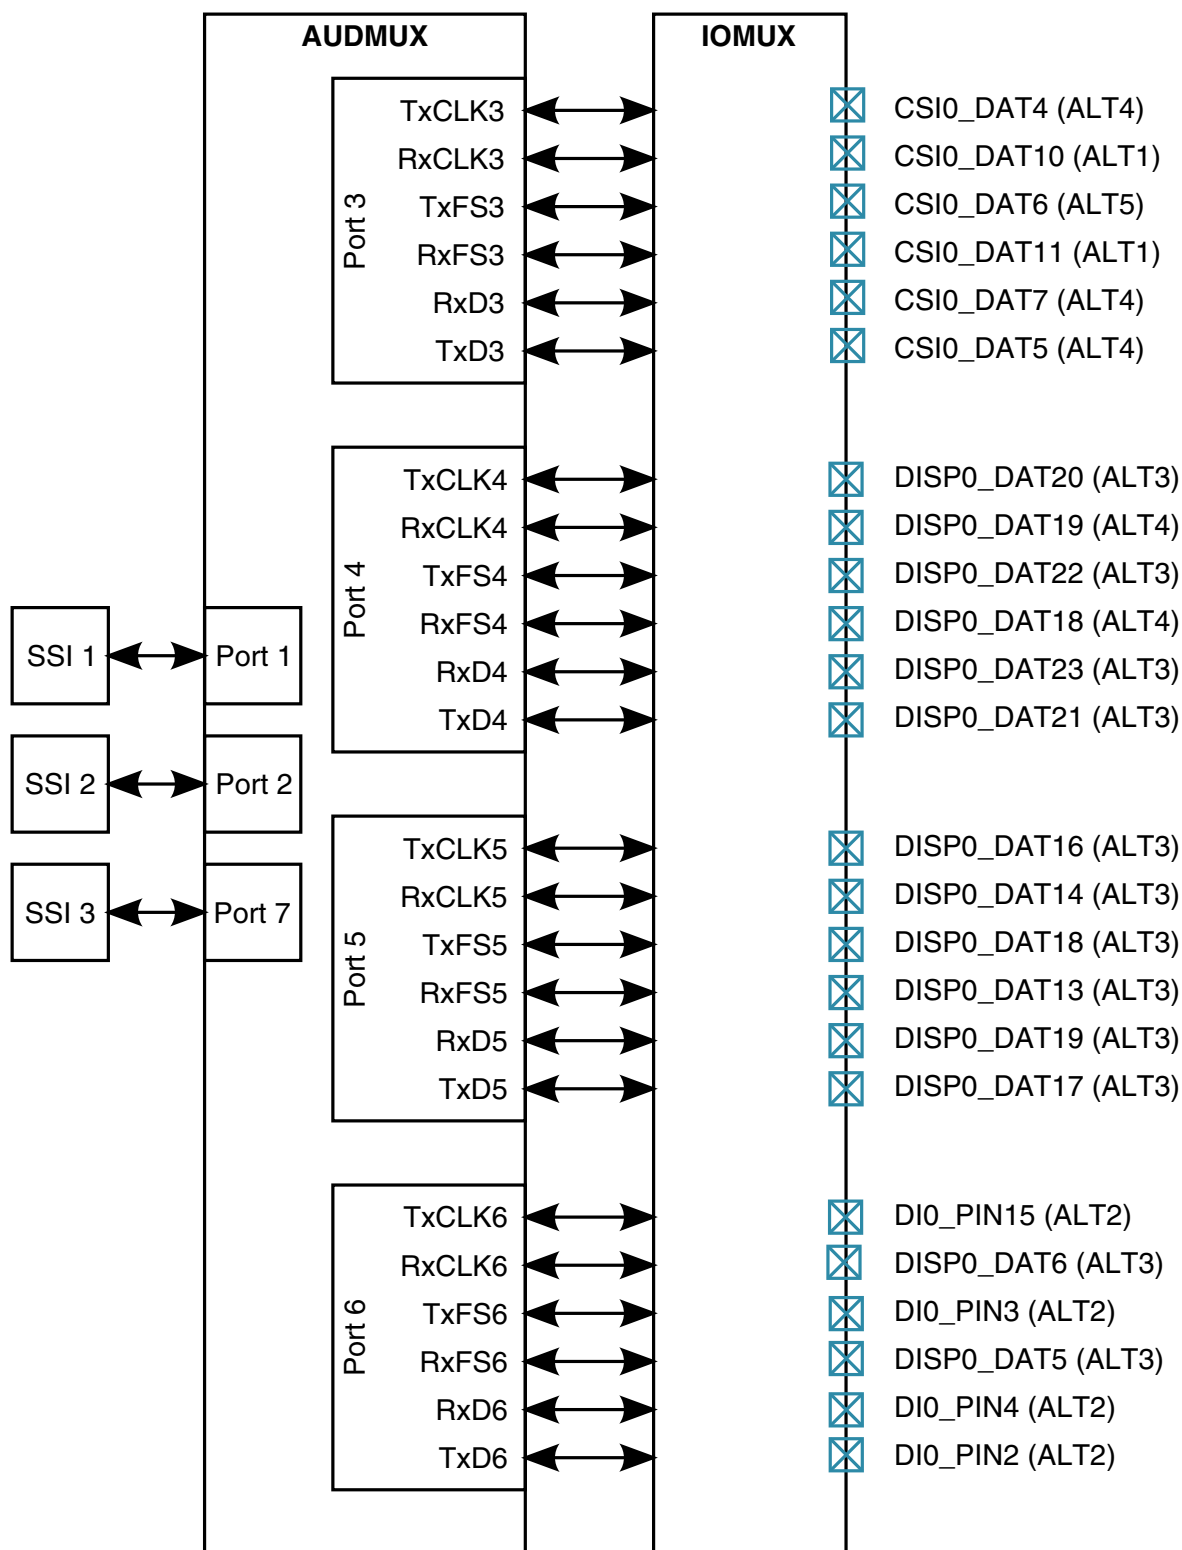

9.12.3 Digital Audio MUX (AUDMUX)

The Digital Audio Mux (AUDMUX) provides a programmable interconnect fabric for voice, audio, and synchronous data routing between host serial interfaces, such as SSI, and peripheral serial interfaces—that is, audio and voice codecs.

The AUDMUX includes two types of interfaces. Internal ports connect to the processor serial interfaces, and External ports connect to off-chip audio devices. A desired connectivity is achieved by configuring the appropriate host and peripheral ports.

The AUDMUX provides flexible, programmable routing of the on-chip serial interfaces to and from off-chip audio devices. The AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself.

The following figure illustrates how the AUDMUX is connected in the system.

❏ - Daisy Chain, i.e. more than one PAD is available (only one option shown above).

Figure 9-13. AUDMUX System Block Diagram
i.MX 6Dual/6Quad Applications Processor Reference Manual, Rev. 1, 04/2013

9.12.4 Enhanced Serial Audio Interface (ESAI)

The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors.

The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. All serial transfers are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available.

The ESAI has 12 pins for data and clocking connection to external devices. The ESAI is internally connected to the ESAI_BIFIFO, and does not connect directly to the shared peripheral bus. The ESAI interface is designed for a 24-bit data bus, while the shared peripheral data bus is 32-bit wide. Also, the ESAI data paths are only double buffered, not allowing efficient DMA service in the applications processor environment. The ESAI_BIFIFO allows increasing the data buffering and data width matching to the shared peripheral bus.

9.12.5 Sony/Philips Digital Interface (SPDIF)

The Sony/Philips Digital Interface (SPDIF) module is a stereo that allows the processor transmit digital audio over it using the IEC60958 standard, consumer format. i.MX 6Dual/6Quad provides one SPDIF transmitter with one output and one SPDIF receiver with one input.

The SPDIF allows the handling of both SPDIF channel status (CS) and User (U) data.

For the SPDIF transmitter, the audio data is provided by the processor via the SPDIFTxLeft and SPDIFTxRight registers, and the data is stored in two 16-word-deep FIFOs, one for the right channel, the other for the left channel. The FIFOs support programmable watermark levels so that FIFO Empty service request can be triggered when the combined number of empty data words locations in both FIFOs is 8, 16, 24 or 32 words. It is recommended to program the watermark level to trigger a FIFO Empty service request when 16 word locations are empty. For optimal performance when servicing the FIFO Empty service request, the FIFOs should be written alternately,

starting with the left channel FIFO. The Channel Status bits are also provided via the corresponding registers. The SPDIF transmitter generates an SPDIF output bitstream in the biphas mark format (IEC 60958), which consists of audio data, channel status and user bits.

The data handled by the SPDIF module is 24-bit wide. The 24-bit SPDIF data is aligned in the 24 least significant bits of the 32-bit shared peripheral bus data word. The 8 most significant bits of the 32-bit word are ignored by the SPDIF Transmitter when data is being stored in the Transmit FIFOs from the peripheral bus. The 8 most significant bits of the 32-bit word are zeroed by the SPDIF Receiver module when the data is being read from the Receiver FIFOs to the peripheral bus.

Note that 16-bit data is left-aligned in the 24-bit word format of the SPDIF. When 16-bit data is to be transmitted, the 32-bit word to be written to the SPDIF Transmit FIFOs should be created as follows: the 16-bit data should be located in the middle two bytes of the 32-bit data word and the 8 bits of the LSB must be set to zero, while the 8 bits of the MSB will be ignored.

The SPDIF Transmit clock is generated by the SPDIF internal clock generator module and the clock sources are from outside of the SPDIF block. The ESAI, SSI's and MLB clock sources should provide a clock that is at least $64 \times F_s$, where F_s is the sampling frequency. The external clock source should provide at least $128 \times F_s$. Clocks of higher frequency may be provided as long as the multiplication factor is a power of 2 (for example, $128x$, $256x$ or $512x$). Also, clock frequency precision of 100ppm or better should be provided.

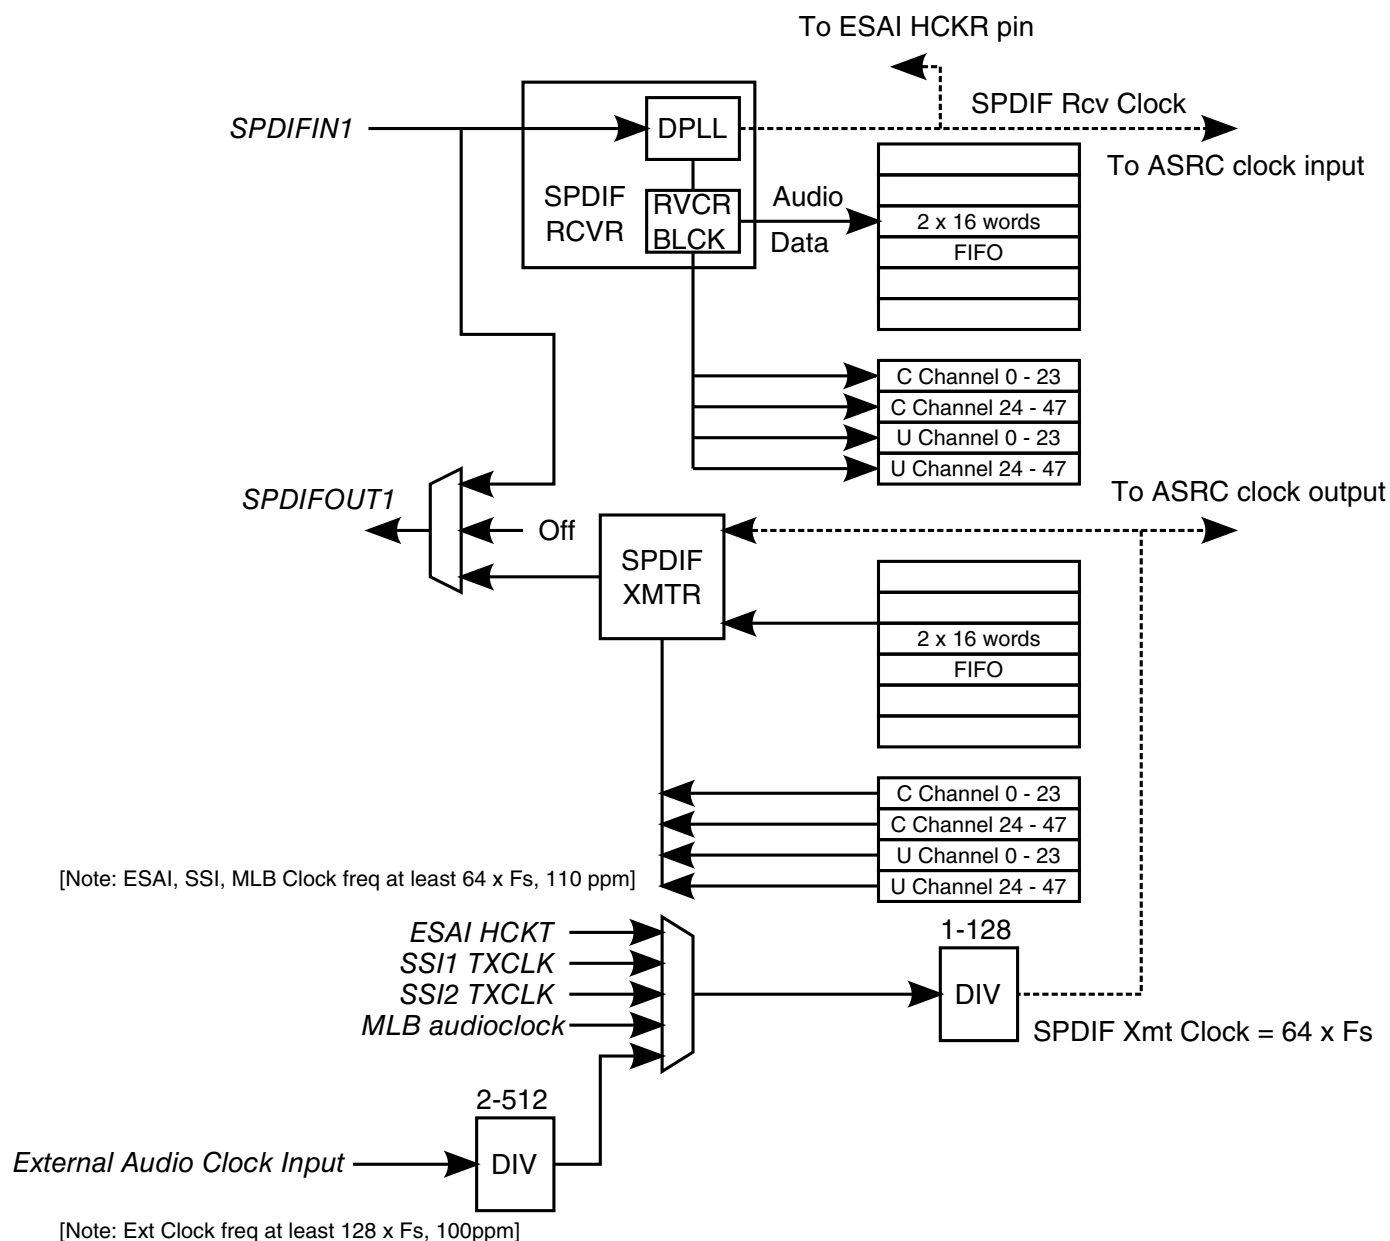

Figure 9-14. SPDIF Transceiver Clock Diagram

9.12.6 Asynchronous Sample Rate Converter (ASRC)

The incoming audio data may be received from various sources at different sampling rates. The outgoing audio data may have different sampling rates, and it can also be associated to output clocks that are asynchronous to the input clocks.

ASRC converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The sampling rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. ASRC supports up to 3 sampling rate pairs.

In the real-time audio use case, both input/output sampling rate clocks are activated. Both sampling rate clocks are directly connected to ASRC, and the ratio estimation of the input clocks to output clocks is used to perform the sample rate conversion in ASRC hardware.

The SSI1, SSI2, SSI3, S/PDIF, ESAI, and MLB audio modules can act as either a clock master or a clock slave. Multiplexors are provided on a chip level to select which of the module's clock signal, input or output, will be connected to ASRC input in dependence of the module's operational mode as it is shown in [Figure 9-15](#) and [Table 9-13](#). [Figure 9-15](#) presents the multiplexor cell used for all ASRC input clocks. [Table 9-13](#) shows the detailed clocks, multiplexor control and data bits for each ASRC input clock. For the audio blocks clocks that are directly connected to ASRC (without the multiplexor scheme) see [Table 9-14](#).

In the non-real time streaming audio use case, the input sampling rate clock does not need to be provided. Instead the ideal-ratio value conversion is set in the ASRC interface registers. In this case only the output sampling rate clock must be provided, and the fixed ratio of the input to the output in the register is used to perform the sample rate conversion.

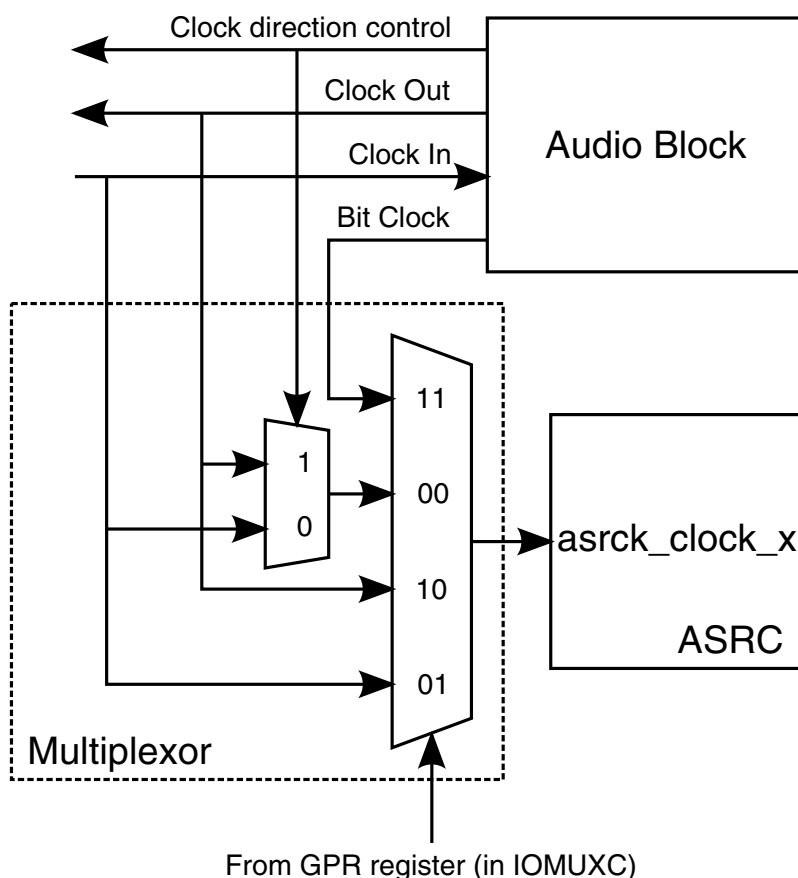

Figure 9-15. Muxing scheme template for ASRC input clocks

Table 9-13. ASRC Muxed Input Clocks

| ASRC Clock Input | Audio block source | MUX2:1 Control | MUX2:1 Input 0 | MUX2:1 Input 1 | MUX4:1 Control | MUX4:1 Input 00 | MUX4:1 Input 01 | MUX4:1 Input 10 | MUX4:1 Input 11 |

Chapter 10

Clock and Power Management

10.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The i.MX 6Dual/6Quad device targets many applications where low power consumption, long battery life, always-on and instant-on capabilities, and no need for active cooling are paramount. For this reason, the i.MX 6Dual/6Quad design constantly focuses on reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the i.MX 6Dual/6Quad architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility:

This introduction contains information about:

- Structural components of the power and clock management systems of the i.MX 6Dual/6Quad device
- Power, clock and thermal management techniques supported by the i.MX 6Dual/6Quad device

All the numerical values are typical or examples, for accurate values one should use the datasheet.

10.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, the Clock and Power rails are considered managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of clock, power and thermal management system of i.MX 6Dual/6Quad device is presented on a figure below.

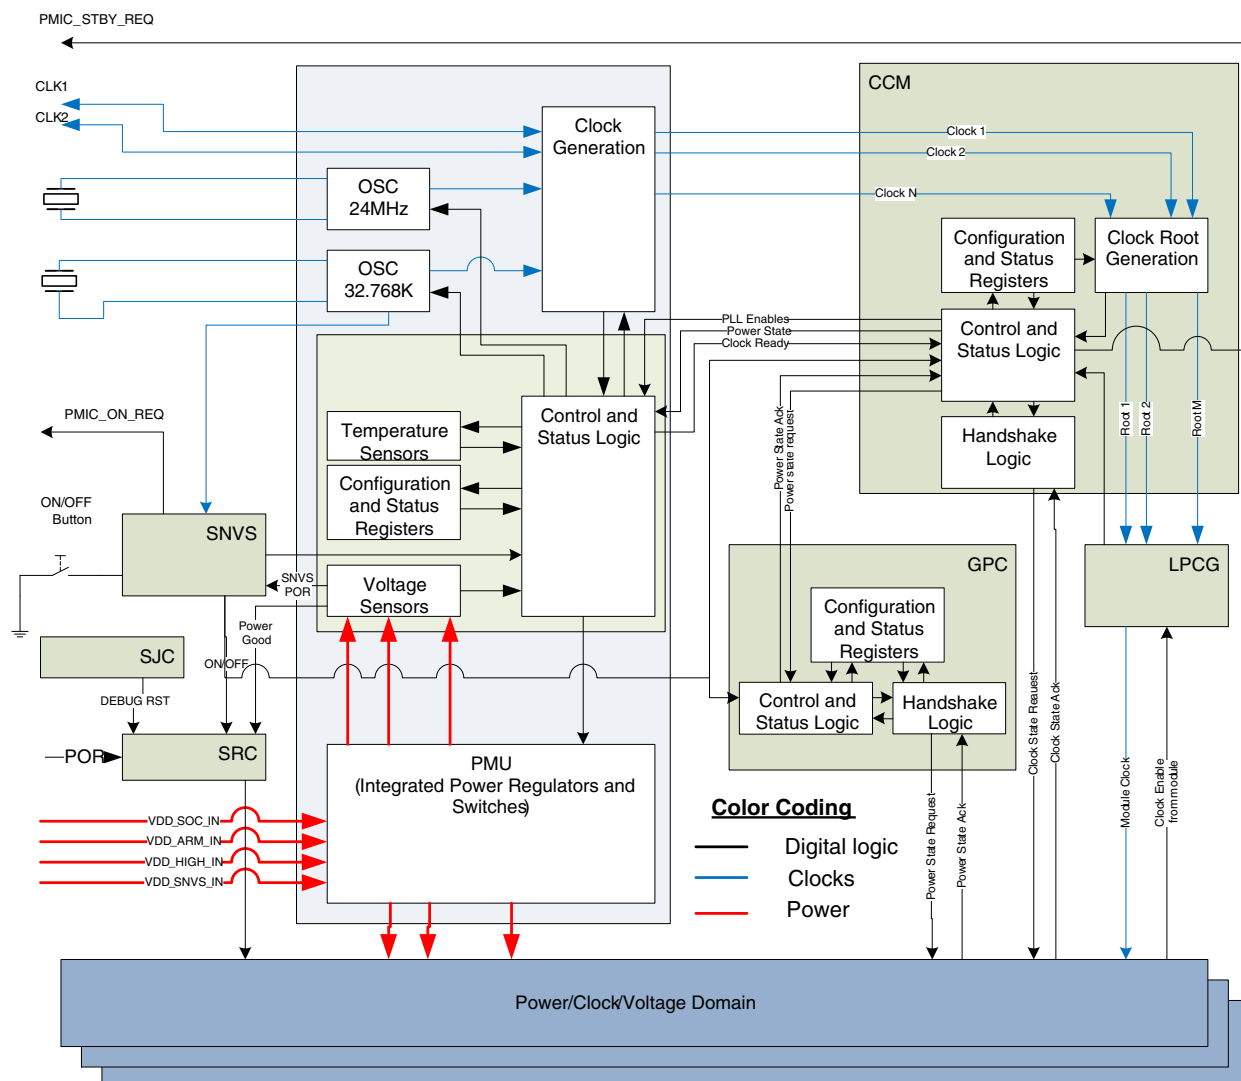

Figure 10-1. i.MX 6Dual/6Quad Power and clock management framework

10.2.1 Centralized components of clock generation and management

Centralized components of clock generation and management sub-system are implemented in the following blocks:

- **CCM (Clock Control Module):** The CCM module provides control for primary (source level) and secondary (root level) clock generation, division, distribution, synchronization, and coarse-level gating.

- See [Clock Controller Module \(CCM\)](#) for information on the CCM architecture, functional description and programming model.
- LPCG (Low Power Clock Gating): This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See [Clock Controller Module \(CCM\)](#) for information on the LPCG architecture and functional description.

10.2.2 Centralized components of power generation, distribution and management

Centralized components of power generation, distribution and management sub-system are implemented in the following blocks:

- PMU (Integrated Power Management Unit). See [Power Management Unit \(PMU\)](#) for information on the PMU architecture, functional description and programming model.
- GPC (General Power Controller). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

10.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented [System Reset Controller \(SRC\)](#). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

10.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with the centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management defines the minimal managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The software component managing shared resources should take

into account the joint constraints of all the modules belonging to that resource domain.

10.3 Clock Management

10.3.1 Centralized components of clock management system

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in figure below.

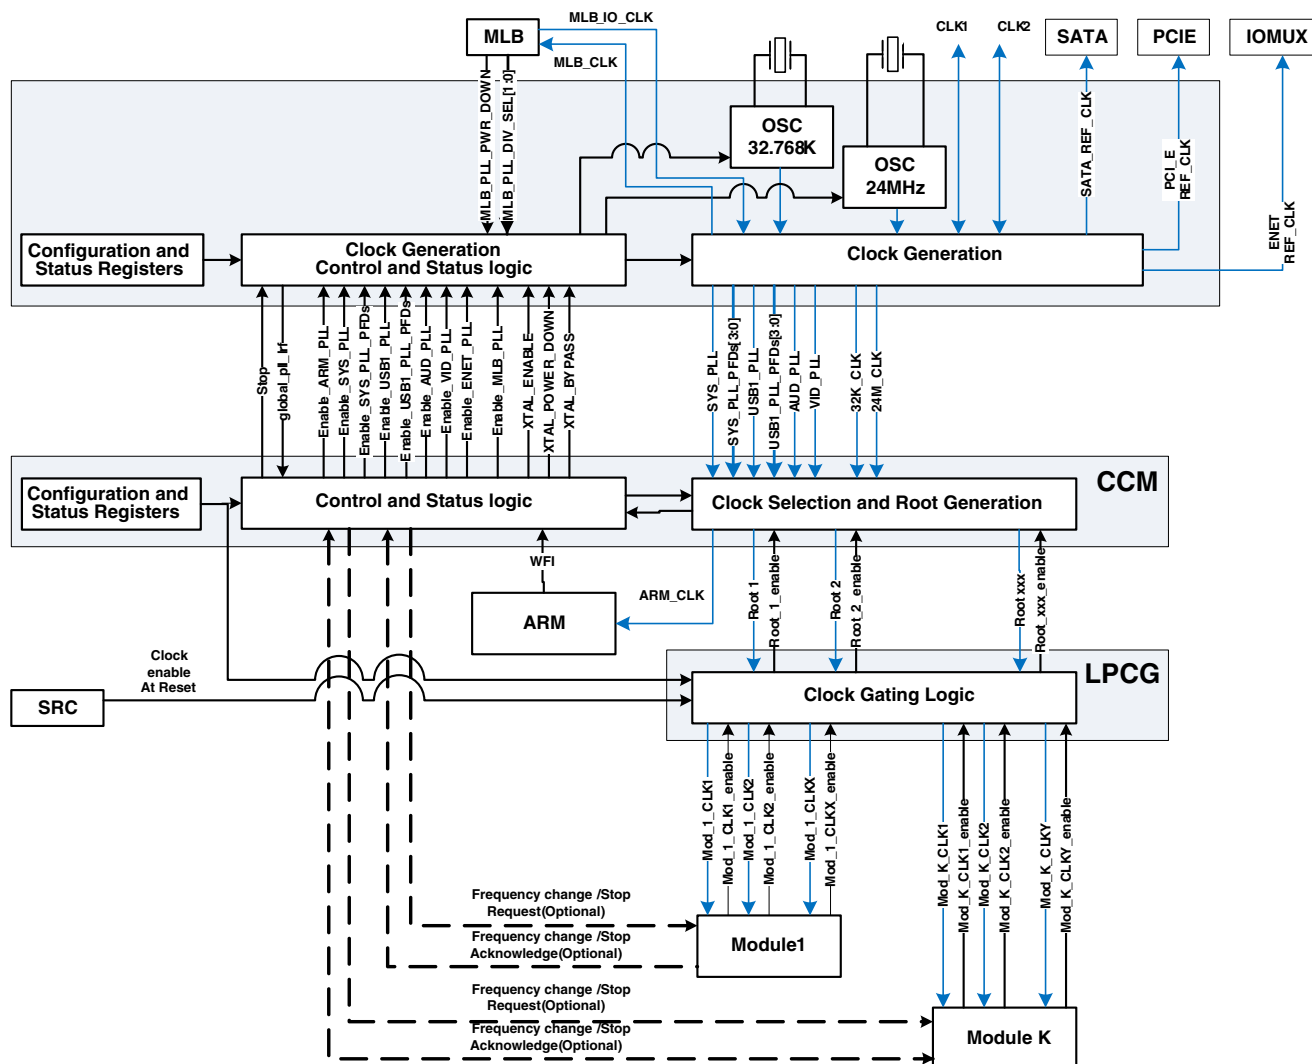

Figure 10-2. Clock Management System

A high level block diagram of the clock generation is shown in the figure below.

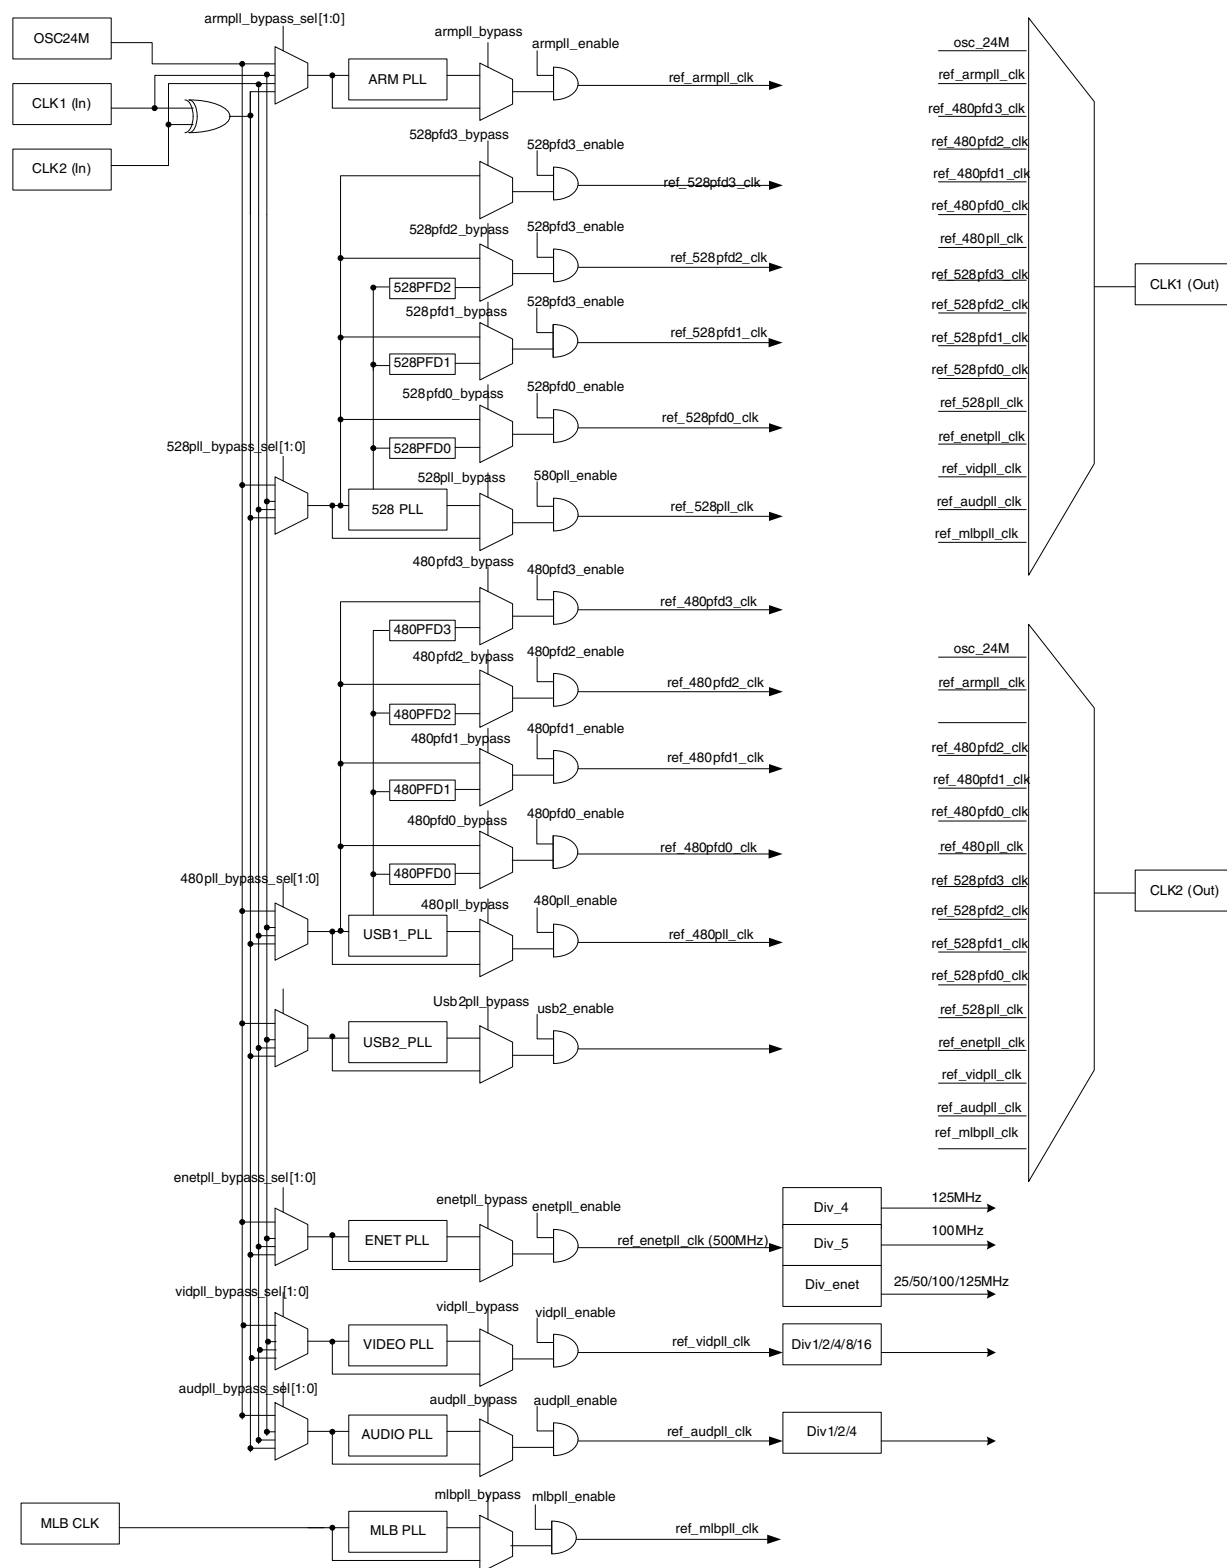

Figure 10-3. Primary Clock Generation

10.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

10.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. Any of them may serve as an external clock input as well. See [Crystal Oscillator \(XTALOSC\)](#) for details of the XTALOSC block.

10.3.2.2 LVDS I/O ports

There are two LVDS I/O ports used for clock generation. These two low jitter differential I/O ports are provided to input and output clocks. They can take input clocks from outside of the SoC and provide them to the PLLs or to the other modules, or they can take the outputs of the PLLs and provide them outside of the SoC as a functional or reference clock.

10.3.2.3 PLLs

Eight PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces $18/N \times F_{vco}$ at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-

fly" without going through the output clock disabling/enabling process.

The eight PLLs are listed below:

- PLL1 (also referred to as ARM_PLL) - This is the PLL clocking the ARM core complex. It is a programmable integer frequency multiplier capable of output frequency of up to 1.3GHz.
- PLL2 (also referred to as System_PLL or 528_PLL) - PLL2 generally runs at a fixed multiplier of 22, producing 528MHz output frequency with 24MHz reference from XTALOSC. It has the capability to spread spectrum the generated signal. Besides the main output, this PLL drives four PFDs (528_PFD0...528_PFD3). The main PLL output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure and/or can be spread-spectrum modulated. Typically, this PLL is a clock source for internal system buses, internal processing logic, DDR interface, NAND/NOR interface modules, etc.
- PLL3 (also referred to as USB1_PLL or 480_PLL1) - PLL3 is used in conjunction with the first instance of USB PHY (USB0 PHY, also known as OTG PHY). This PLL also drives four PFDs (480_PFD0...480_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480MHz with a 24MHz oscillator. The main PLL output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART, CAN and other serial interfaces, audio interfaces, etc.
- 480_PLL2 (also referred to as USB2_PLL) - This PLL provides clock exclusively to USB2 PHY (also known as HOST PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480MHz with a 24MHz oscillator.
- PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650MHz to 1300MHz, and the frequency resolution is better than 1Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
- PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650MHz to 1300MHz, and the frequency resolution is better than 1Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or 16 from the PLL VCO frequency.

- PLL6 (also referred to as PLL_ENET) - This PLL implements a fixed $20+(5/6)$ multiplier. With a 24MHz input, it has a VCO frequency of 500MHz. This PLL is used to generate:
 - 125MHz for the PCIe serial interface and reduced gigabit ethernet interface.
 - 100MHz for the SATA serial interface
 - 50 or 25 MHz for the external ethernet interface.
- MLB_PLL - This PLL takes the Media Link Bus (MLB) interface clock, multiplies it up by 1, 2, or 4, and delay compensates so that the MLB data stream can be captured.

10.3.2.3.1 General PLL Control and Status Functions

PLLs configuration and control functions are accessible via individual per PLL and PFDs and global configuration and status registers.

Reference input clock for any of the PLLs except the MLB PLL could be selected individually by the BYPASS_CLK_SRC field of the PLL control register. See [CCM Analog Memory Map/Register Definition](#) for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the BYPASS bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (ENABLE=0), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the ENABLE bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx_CLKGATE bit in CCM_ANALOG_PFD_480n or CCM_ANALOG_PFD_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at www.freescale.com for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

[CCM Memory Map/Register Definition](#) and [CCM Analog Memory Map/Register Definition](#) contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

10.3.2.4 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the [Power modes](#), namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- ARM core clock - "on the fly" without clock interruption, by either shifting between PLL sources [PLL clock change](#) or by changing the divider ratio.
- Graceful changing of the DDR memory controller clock. See [MMDC handshake and Self refresh and Frequency change entry/exit](#) for more details.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

NOTE

Note: on-the-fly frequency changing for synchronous interfaces like serial audio interfaces (SSI, ESAI), Audio Sample Rate Converter (ASRC), video and display interfaces (MIPI, IPU), or general purpose serial interfaces (UART, CAN) in general causes synchronization loss and should not be done.

10.3.2.5 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from four sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.
- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

10.3.3 Peripheral components of clock management system

The figure found here shows the clock interface of a functional module in the i.MX 6Dual/6Quad system.

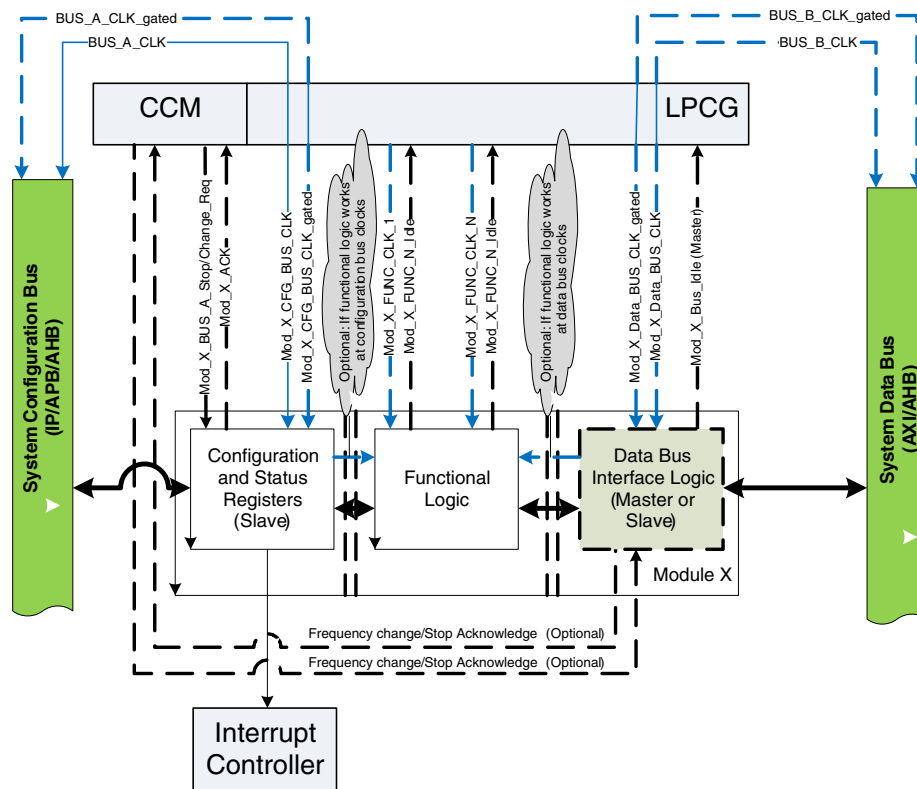

Figure 10-4. Clock interface of the functional module in i.MX 6Dual/6Quad system

10.3.3.1 Interface and functional clock

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).

- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity (in the case of IPU, that could be the clock for a display interface or a camera sensor interface).
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

10.3.3.2 Block level clock management

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

10.3.3.2.1 Master clock protocol

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of modules supporting master clock protocol are VPU, GPU3D, GPU2D, VDOA and USDHC. Please see details in chapters describing these modules and in [CCM Module Enable Override Register \(CCM_CMEOR\)](#)

10.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are product="mx6dq mx6sdl">CAN, EPIT and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Override Register (CCM_CMEOR). See [CCM Memory Map/Register Definition](#) for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

10.3.3.3 Clock Domain(s)

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

Examples of clock domains are: Main AXI bus clock domain, VPU clock domain, GPU3D clock domain, etc.

10.3.3.4 Domain level clock management

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

10.3.3.5 Domain dependencies

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

10.4 Power management

10.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks.

A high level block diagram of the power management system in the SoC environment is shown in the figure below.

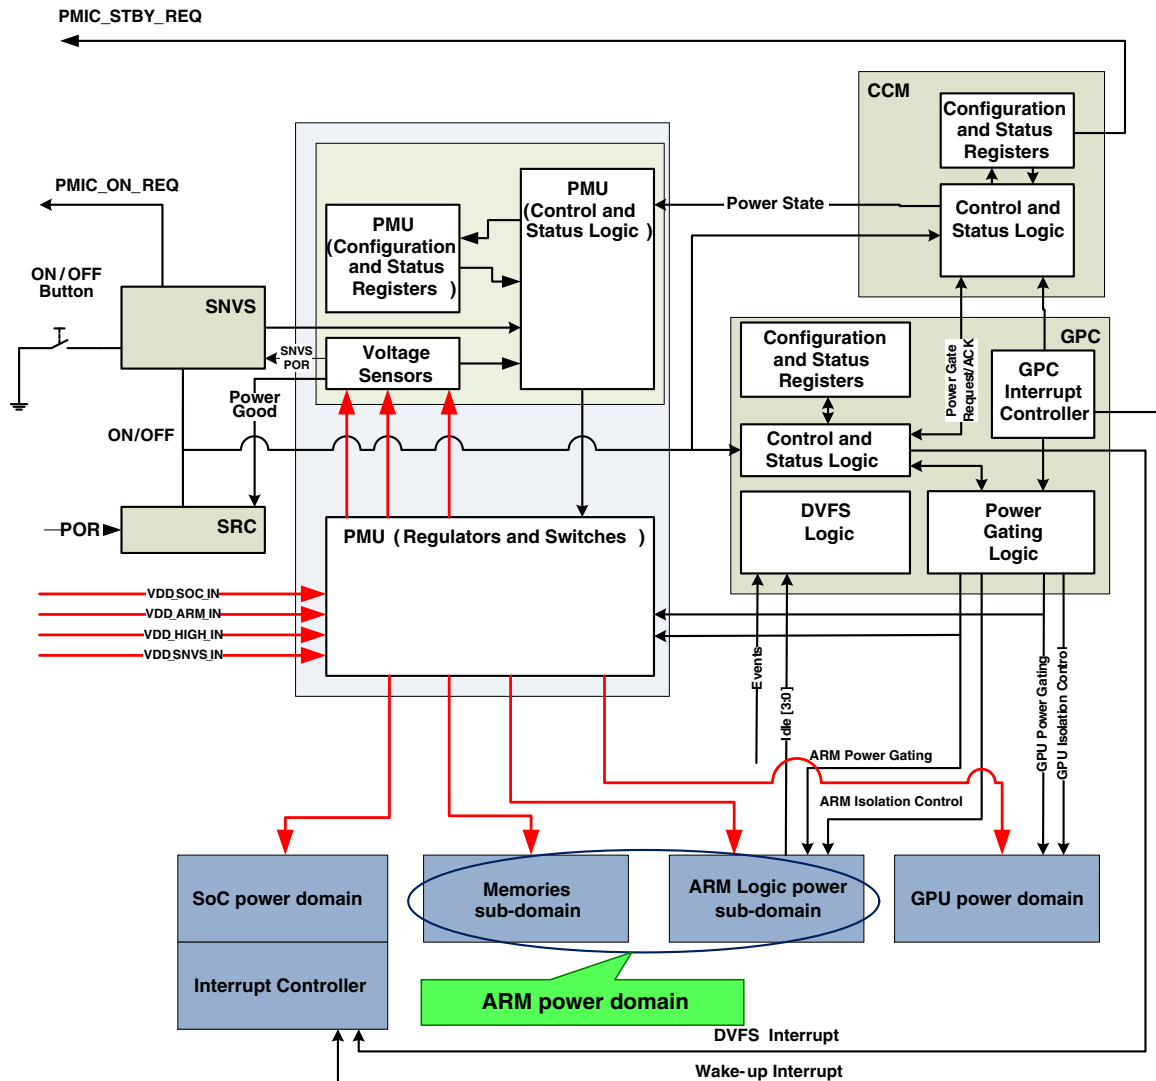

Figure 10-5. i.MX 6Dual/6Quad Power Management System

10.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

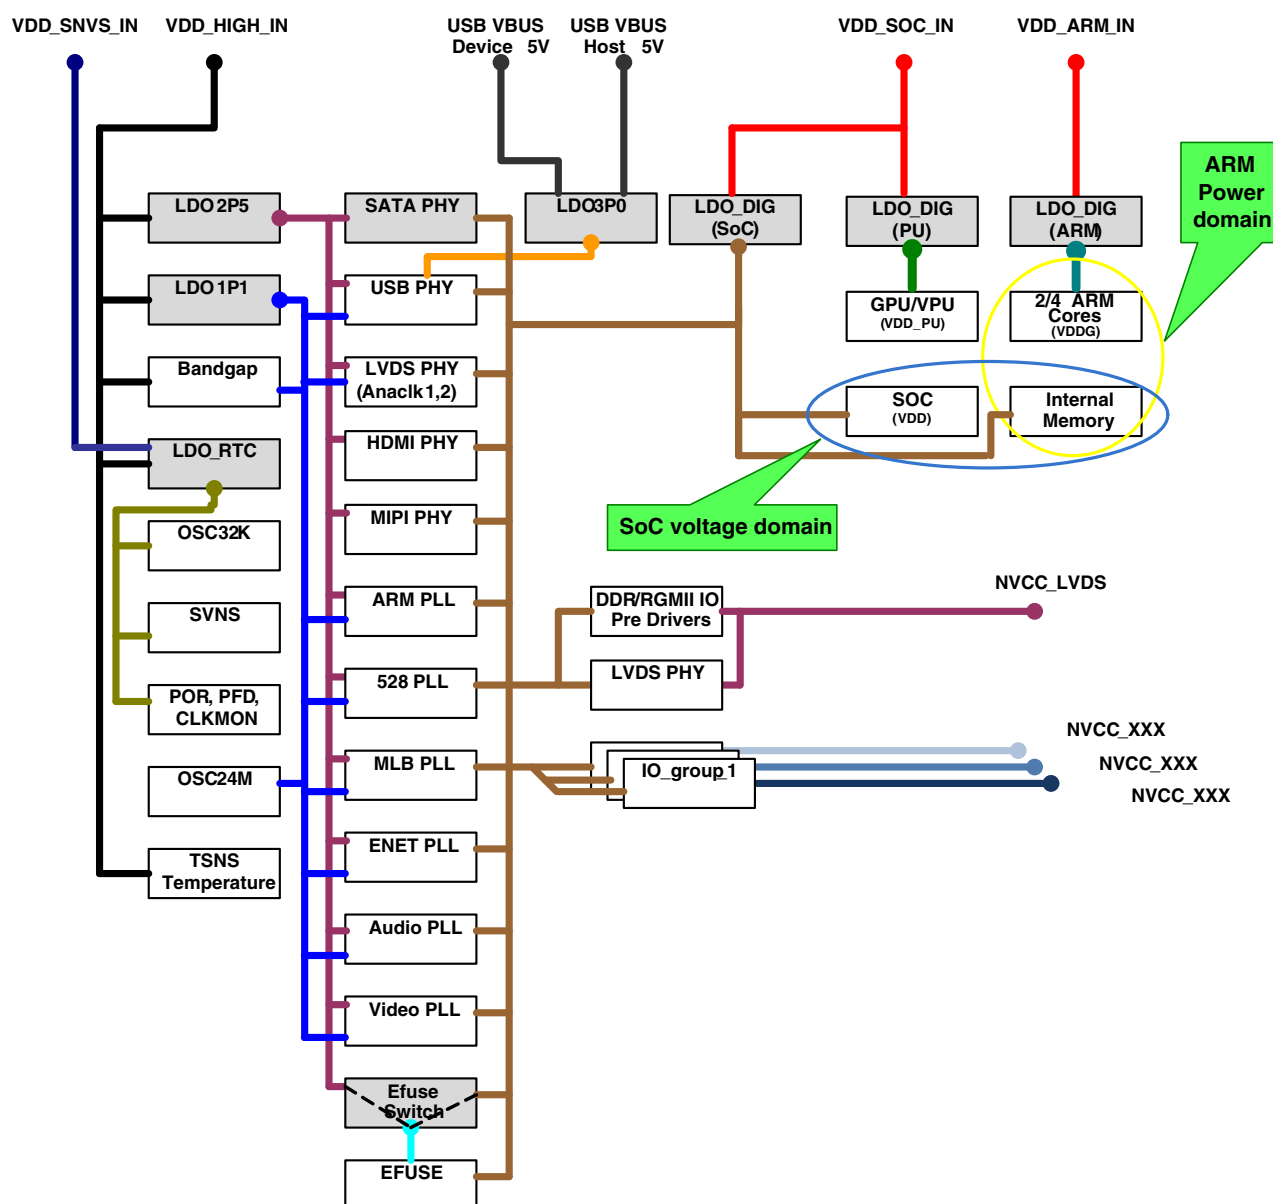

Figure 10-6. i.MX 6Dual/6Quad Power Tree

The integrated PMU includes the following components:

- Three Digital LDO regulators
- Two Analog LDO regulators
- USB LDO
- SNVS regulator
- Reverse well biasing

See [Power Management Unit \(PMU\)](#) for further details on integrated PMU functional description and programmability.

10.4.1.1.1 Digital LDO Regulators

The integrated PMU includes three digital LDO regulators: LDO_ARM, LDO_PU, and LDO_SOC. These regulators provide power to the ARM_Core power domain, the combined VPU, IPU and GPU power domain, and the rest of the SoC logic (except always-ON SNVS domain).

NOTE

The name "digital" only refers to the type of load. It is not related to the LDO design or feature set.

The digital LDO regulators can operate in the following modes:

- **Internal Bypass** - The regulation pass device (FET) is switched fully on, passing the external input voltage to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and the FET. Be aware that some time is required to switch from the internal digital bypass mode to the analog regulation mode. Typically it takes less than 100us. Please refer to [PMU](#) for further details on bypass and power gate configuration.
- **External Bypass** - The input and output of the regulator are shorted externally to the SoC. If operating in this configuration, enable the internal bypass early in the startup sequence before attempting high frequency/high power operation. Be aware that internal power gating is not available in this mode.
- **Power Gate** - The regulation FET is switched fully off, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage will fall to a level where the residual leakage of the power FET balances with the leakage of the load. Power gating is applicable to ARM and PU power domains.
- **Analog regulation mode** - The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

These digital regulators also feature brownout detection, which is helpful to sense when supplies are starting to collapse. Note that the core will be interrupted on a brownout. Please see details in [Miscellaneous Control Register \(PMU_MISC2n\)](#).

For further details of LDO programming and configuration please refer to [Digital Regulator Core Register \(PMU_REG_CORE\)](#).

The power management system is built under assumption that in typical applications the single (and simple) shared power supply will be used for ARM core domain and SoC domain. The combined load gains some efficiency, especially in low power modes and saves BoM significantly.

The DVFS in a typical cost/complexity optimized application is considered by mean of internal LDO. In "full speed" modes LDO bypass is considered in both domains. The dynamic voltage scaling to low load workpoints for ARM domain is implemented by programming associated LDO.

In highly power-optimized systems, it is possible to use multiple external DCDC buck converters and bypass internal LDO for high power domains. The obvious trade-off is in the increased complexity of the external power supply components and the associated increase in the BoM and board design complexity.

10.4.1.1.2 Analog LDO regulators

There are two analog LDO regulators used for general system purposes:

- LDO_1P1 - The LDO_1P1 linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24MHz oscillator.
- LDO_2P5 - The LDO_2P5 linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage. The regular 2.5V LDO is combined with an alternate self-biased low-precision weak regulator which can be enabled for applications that need to keep the 2.5V output voltage alive during low power modes, where the main regulator and its associated global bandgap reference module are disabled to save power. The output of this weak-regulator is not programmable and is a function of its input power supply as well as its load current. Typically with a 3V input power supply, the weak-regulator output is 2.525V and its output impedance is approximately 400ohm. Special procedure is recommended to move load back and forth between the main and low power regulators. This regulator supplies most of the analog circuitry of the integrated PHYs, special I/Os (LVDS I/O, DDR I/O), and other analog and mix signal components integrated into the SoC.

10.4.1.1.3 USB LDO

The USB_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are

present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

10.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS_IN supply and generates the SNVS_CAP supply, which in turn powers the real time clock and low power section of the SNVS blocks. If VDDHIGH_IN is present, then the SNVS_IN supply is internally shorted to the VDDHIGH_IN supply to allow coin cell recharging if necessary.

10.4.1.1.5 Reverse well biasing

The reverse well biasing module on the SoC consists of a self-clocked/self-regulating charge-pump circuit, used to generate a negative bias voltage for the floating PWELL, and a low-power regulator. The low-power regulator is used to generate a positive bias voltage for the NWELL of the digital logic cells on the SOC power domain. Static leakage reduction can be achieved during SoC low-power modes through the use of these reverse well bias voltages. Please refer to the CCM_CLPCR register in [CCM Memory Map/Register Definition](#) and PMU_MISC0 in [PMU Memory Map/Register Definition](#) for details about well bias control and [Static](#) " for functional description of the reverse well biasing.

10.4.1.2 GPC - General Power Controller

The GPC block provides hardware assistance to Dynamic Voltage Frequency Scaling (DVFS) and power gating, and includes the sub-blocks listed here.

- DVFS load tracking block - This block allows hardware tracking on the core load and generates an interrupt when a frequency change is requested. It does not generate any request for voltage and/or frequency changes made by a hardware signal. The frequency/voltage changing process requires interaction with the CCM block, as well as either the integrated PMU modules or the external programmable regulator. This process should be completed by either the CPU interrupt routine or a DMA transaction.
- Power Gating Controller (PGC) - This sub-block of GPC has the following functions:
- Provides the user with the ability to switch off power to a target subsystem.
- Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.

- Provides programmable registers that adjust the timing of the power control signals.
- Controls the CPU power domain and the combined GPU/VPU power domain.
- Wake-up interrupt controller - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals.

Additional features are as follows:

- Supports up to 128 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal

See [General Power Controller \(GPC\)](#) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

10.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR, WARM, and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See [System Reset Controller \(SRC\)](#) for further details on SRC functional description and programmability.

10.4.1.4 Power domain(s)

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

Figure below shows the power domain interface in the i.MX 6Dual/6Quad system

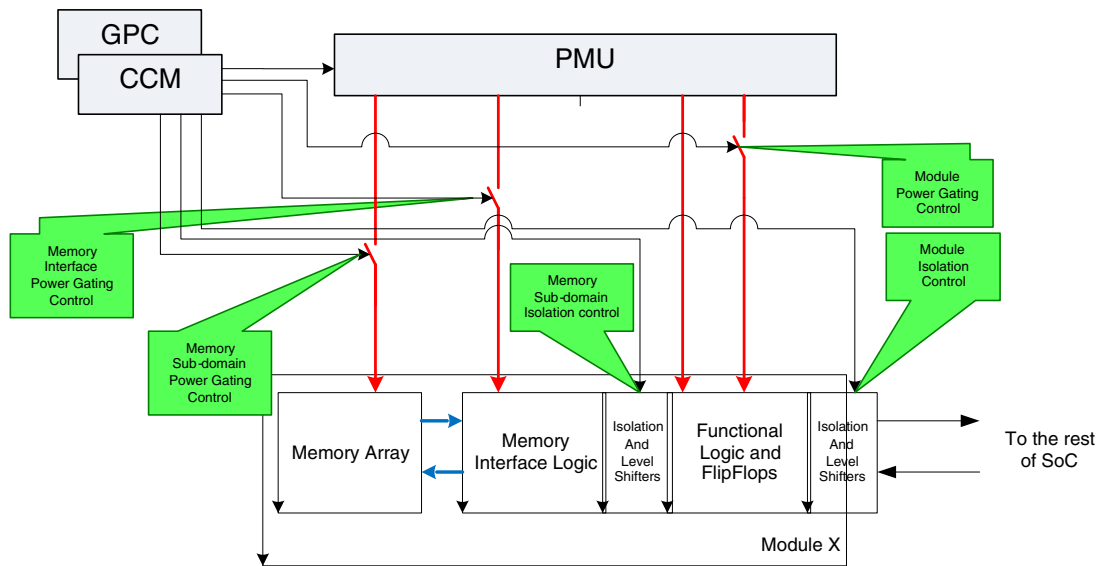

Figure 10-7. Power domain interface in i.MX 6Dual/6Quad system

10.4.1.4.1 Power distribution

The i.MX 6Dual/6Quad power distribution tree is comprised of multiple power domains. The main power domains are:

- ARM - The ARM domain contains the ARM Core platform (except for memory arrays and interface logic). This domain can be supplied either from an integrated power supply or from an external controllable regulator, preferably high efficiency DCDC converter.
- ARM Memory array - Memory arrays are connected to a separate and dedicated power domain (separated from the Main logic and ARM domain). In normal operation mode (functional, non-DVFS mode), the memory arrays domain voltage level should be kept equal to (same as) the rest of the core logic domains (Main, ARM). Please refer to the Datasheet for further information about voltage level difference between domains allowed in different power modes.

- Combined GPU and VPU domain - The combined GPU/VPU domain contains all GPU3D and GPU2D engines and VPU engine.
- SNVS/RTC low power domain - The SRTC domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply.
- Analog domain - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.
- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC including most of the peripherals. It is supplied by an internal regulator.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- Cortex-A9 Core Platform - DVFS and power gating.
- ARM memories - Power gating only.
- GPU3D and VPU - Power gating only.

See table below for details of the i.MX 6Dual/6Quad system power domains layout and dependencies.

10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating

The following is the list of relevant memories and logic domains with the description of their state-retention support:

- Cortex-A9 Core Platform is sub-divided into three sub-domains listed below:
- Cortex -A9 Core Platform logic: The software state retention for all logic is implemented in this domain. That means that the content of relevant registers should be stored in some memory retaining its state (L2 cache for example) while the logic domain is power-gated. Details on how to implement the software retention can be found in the Cortex-A9 Core Platform TRM.
- Cortex-A9 Core L1 memories - No retention. The L1 memories have a dedicated supply on the package (VDD_CACHE_CAP) which should be connected to the Cortex-A9 Core Platform supply. The L1 cache should be flushed prior to power gating in order to allow powering up of the CPU at the same state as before power gating.
- Cortex-A9 Core L2 memories - hardware state-retention since its supplies are driven by the SoC supplies.

- GPU3D, GPU2D and VPU: These three modules can be power gated (together) independently of Cortex-A9 power gating, because it resides on a separate power domain. State retention is supported neither for GPU3D, GPU2D and VPU logic nor for their internal memories.
- ANALOG PHY IPs - PCIe, SATA and HDMI - hardware state-retention since its supplies are driven by non-gated supplies.
- SoC - hardware state-retention in Standby mode. Reverse Well Biasing is applicable for this domain.
- SNVS_LP - hardware state-retention even when SoC supplies are removed.

10.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

10.4.1.4.3.1 Cortex-A9 Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in [PGC Memory Map/Register Definition](#) as follows to power-down the core on the next "WFI" instruction:
 - Configure the GPC/PGC PGC_CPU_PDNSCR Register ISO and ISO2SW bits. These bits determine the delay between the power-down request to enabling the platform isolation and the platform isolation to the actual power-off switch to the supplies accordingly.
 - Configure the GPC/PGC PGC_CPU_PUPSCR Register SW and SW2ISO bits. These bits determine the delay between the power-up request to the actual power-up of the supplies and the last to the platform isolation disabling.
 - Configure the GPC PGC PGC_CPU_CTRL PCR bit to allow the power down of the platform
 - Cortex-A9 Core Platform should execute a "WFI" instruction.

Figure 10-8. Cortex-A9 Core Platform isolation and power on switch flow

10.4.1.4.3.2 GPU3D, GPU2D and VPU

1. Configure the CCM CGR bits ([CCM Memory Map/Register Definition](#)) to disable the GPU3D, GPU2D and VPU clocks.
2. Configure the GPC/PGC GPU registers ([GPC Memory Map/Register Definition](#)) as follows to power-down isolate the GPU3D, GPU2D and VPU logic from the rest of the SoC logic:

Configure the GPC/PGC PGC_GPU_PDNSCR Register ISO bits. These bits determine the delay between the power-down request to enabling the PU isolation.

Configure the GPC/PGC PGC_GPU_PUPSCR Register SW2ISO bits. These bits determine the power-up request to the PU isolation disabling.

Configure the GPC PGC PGC_GPU_CTRL PCR bit to allow the power down of the platform.

1. Software should wait PDNSCR x IPG_CLK cycles before next step which is powering down the PU
2. Configure the PMU PMU_REG_CORE ([PMU Memory Map/Register Definition](#)) to gate off the VPU/GPU regulator. The exit sequence should be in the reversed order i.e. restore power first and enable the clocks last.

When powering up the PU domain a delay may need to be added between enabling the PU LDO and disabling the PU isolation.

Figure 10-9. GPUs and VPU isolation and power on switch flow

10.4.1.4.3.3 SoC

For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM_CCR[COSC_EN] ([CCM Memory Map/Register Definition](#)). This can be done only in case there is no dependency on 24MHz XTAL for wake-up.

- Enable reverse well biasing by configuring the CCM_CLPCR[WB_PER_AT_LPM] bit ([CCM Memory Map/Register Definition](#)).
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS_LP is powered through an "always on" supply, configuring the SNVS_LP DP_EN to "1" allows changing the PMIC_ON_REQ pad (SoC on/off supply indication to the PMIC) through the RESET_IN_B pad.

10.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- Cortex-A9 Core Platform - Isolation needs to be enabled before power-down. This is taken care of automatically once CCM and PGC are configured and the Cortex-A9 Core Platform executes the "WFI" instruction.
- GPU3D, GPU2D and VPU - Isolation needs to be enabled before power-down. This should be taken care through software configuration of the PGC.
- SNVS_LP - Different from the 2 cases above the SNVS_LP isolation isolates the signals coming from the SoC to the SNVS_LP. This is required for saving the contents of the SNVS_LP. (such as the real-time clock) The isolation is activated in 2 ways:
 - Automatically through the power-fail detector in the PMU
 - Through software configuration

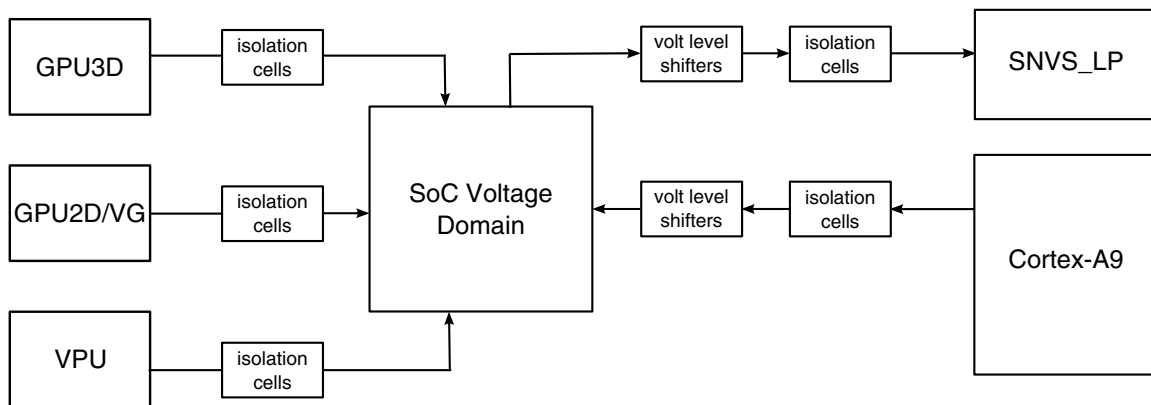

Figure 10-10. Isolation cells and Voltage level shifters placing

10.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- ARM - Cortex-A9 Core Platform including L1 cache - Scalable voltage in both dynamic and static scenarios
- SoC and PU - Scalable voltage only in static scenarios
- ANALOG components including SATA, PCIe, HDMI, MIPI, LVDS and PLLs - Fixed voltage
- I/O - Fixed voltage
- SNVS_LP - Fixed voltage

10.4.1.6 Voltage domain management

10.4.1.6.1 Dynamic

10.4.1.6.1.1 DVFS

Dynamic Voltage and Frequency Scaling (DVFS) is a well-known technique to reduce power consumption in mobile devices. In order to improve power saving efficiency, DVFS is applied on the ARM core voltage domain.

In this scenario the Dynamic Voltage and Frequency Scaling (DVFS) block is used. More details can be found in [DVFS-CORE \(DVFS\)](#). The DVFS block can monitor separately the IDLE indication of each of the Cortex-A9 Cores. The DVFS performs the following:

- Simple, non-overlapping averaging providing a level-based average index of the tracked CPU load
- Sums the CPU load and the load detected from additional load indicators weighted according to software configurations
- Calculates an exponential moving average of the tracked load
- Provides up, down and "panic" threshold comparators and counters for generating interrupts to the Cortex-A9 Core Platform
- Frequency pattern generator is able to manage the frequency update requests periodically

The DVFS interrupts are then forwarded to the Cortex-A9 Core Platform. The Cortex-A9 Core Platform reacts according to the DVFS interrupt types. The following are 2 examples for handling different DVFS interrupt types:

- Upper threshold is reached, meaning that the Core is heavily loaded and the core frequency needs to be increased according to the following flow:
 - Configure PMU to raise the core voltage
 - Wait until the voltage is stable
 - Configure CCM to raise the frequency.

- Lower threshold is reached, meaning that the Core is "IDLE" most of the time and the core frequency can be decreased according to the following flow:
- Configure CCM to reduce the frequency.
- Configure PMU to lower the core voltage.

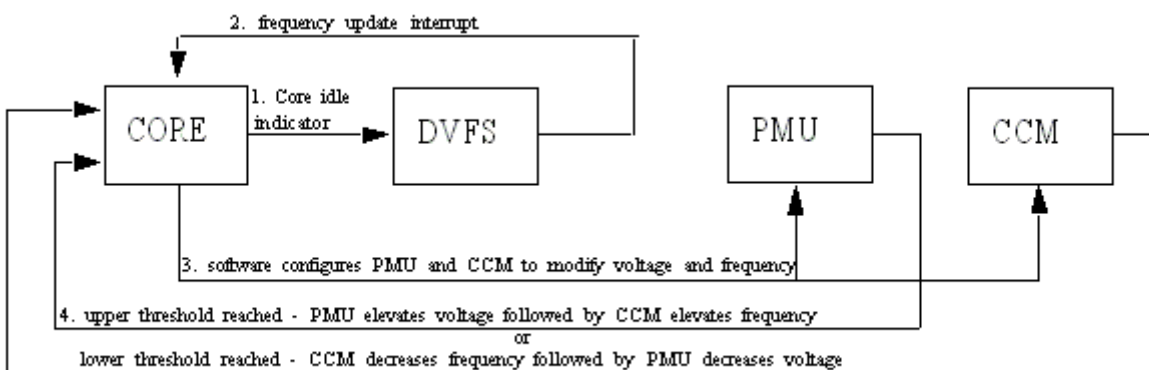

Figure 10-11. High Level DVFS working flow

NOTE

PMU can not be used to change the voltage in case the LDO is bypassed.

10.4.1.6.1.2 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the ARM, SoC and PU voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

10.4.1.6.2 Static

10.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains
- Reverse well-biasing in STOP, WAIT, or Deep Sleep Mode (DSM) modes

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM_CCR), CCM Low Power Control Register (CCM_CLPCR) and PMU Miscellaneous Register 0 (PMU_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage and reverse well bias to the SoC:

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM_CCR[RBC_EN] bits to bypass and disable PMU regulators in the next ARM "WFI" execution.
- Configure CCM_CCR[REG_BYP_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.
- Cortex-A9 Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode
- After that, the reverse well bias will be applied automatically (if enabled) with appropriate delay. Please refer to CCM_CLPCR and CCM_CCR Registers in CCM for further information on reverse bias enabling and counters configuration.

10.4.1.6.2.2 ANALOG PHYs IPs -

The PCIe, SATA and HDMI analog PHYs can also be configured to consume less power when they are in a non-active state. Details on how to put the IPs in low power mode can be found in each of the IP documentation. Further reduction can be achieved by settings the ENABLE_WEAK_LINREG in the PMU PMU_REG_2P5 register.

10.4.1.6.3 Voltage domain dependencies

When applying voltage changes for power saving the following voltage domain limitations should be taken into account:

- In dynamic scenarios the SoC and PU voltage supplies should not differ
- In dynamic scenario's the ARM supply should not be higher than the SoC supply by more than 50mV.
- In dynamic scenarios VDDCACHE_CAP should not be above VDDARM_CAP by more than 200mV and VDDARM_CAP should not be above VDDCACH_CAP by more than 50mV

The above limitations are also mentioned in datasheet.

10.4.1.6.4 IO voltage

10.4.1.7 i.MX 6Dual/6Quad system domains layout

The following table describes the different aimed power modes for i.MX 6Dual/6Quad:

NOTE

Wakeup time is the hardware perspective, and doesn't reflect the time it takes software to resume drivers and perform system operations.

Table 10-1. Aimed power modes

| Mode | Description (Status of main power domains) | Wake-up capability | Wakeup time | Applicable use case |
|---------------|---|---|-----------------------------|--|
| RUN | Power supplies are on, all clocks are on. | N/A | N/A | All |
| WAIT | Power supplies are on. ARM executes WFI command, Option to gate off clocks for specific modules based on programmable bits. | Based on interrupt from any module | Immediate (ARM exit WFI) | IDLE process of operating system. |
| STOP | Power supplies are on. ARM executes WFI command. VPU and GPU are in power gating PLLs are off, hence all system clocks are off. | Based on interrupt from modules that can track operation with low frequency clock- like Keypad press, GPIO, Timer, CAN activity, etc. | ~50us | Suspend state of operating system - system is on but is waiting for operation. |
| Standby | <ul style="list-style-type: none"> - PLLs disabled - Low voltage could be applied to ARM and SoC power inputs - Chip regulator bypass if reduce supply voltage, - Well Bias could be activated - CPU regulator disabled for power gating - PU regulator is disabled in software - xtal enabled | Same as above | ~220 us | Low power standby mode with limited reaction on external events |
| Deep Sleep | Same as above but with OSC24M disabled | Interrupts from modules those could generate asynchronous interrupts (Keypad, GPIO, SNVS) | ~1400us | |

Table continues on the next page...

Table 10-1. Aimed power modes (continued)

| Mode | Description (Status of main power domains) | Wake-up capability | Wakeup time | Applicable use case |
|------|---|---|---|---------------------|
| SRTC | Only SNVS domain and OSC32K keep alive | <p>SRTC security alert / SRTC timer expire.</p> <p>Based on each one of those, SRTC module will generate request to PMIC to perform POR sequence and walk-up the system. The system will go through boot process.</p> <p>PMIC can also receive press on "ON" button to walk-up the system. This should be connected directly to PMIC.</p> | <p>~1700us to WARM boot</p> <p>COLD boot, depends on boot procedure and boot device</p> | |

There is a single hardware signal coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is implemented is controlled by the PMU_MISC0[STOP_MODE_CONFIG] bit (See [PMU Memory Map/Register Definition](#)). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop_mode signal. Blocks not described in the section below are unaffected by stop_mode.

If the stop_mode_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop_mode_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

Table 10-2. STOP mode configuration

| Block | STOP_MODE_CONFIG=0 | STOP_MODE_CONFIG=1 |
|---------------------------------|---|--|
| reg1p1 | off | on |
| reg2p5 | off | on |
| reg3p0 | off/on depending on vbus. Uses crude local reference if vbus is present | off/on depending on vbus . Uses analog central bandgap if VBUS is present. |
| reg_core | bypassed if not power gated. | bypassed if not power gated |
| reg_pu | bypassed if not power gated. | bypassed if not power gated. |
| reg_soc | bypassed | bypassed |
| bandgap | off | functional |
| temp_sensor | off | off |
| well_bias | hardware controlled | hardware controlled |
| All PLs | off | off |
| OSC24M | off | Controlled by CCM configuration |
| LVDS clock in/out CLK1 and CLK2 | off | off |

10.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses
- Memory retention and state retention capability (Software State Retention for ARM A9) for preserving memory contents and device state in low-power modes
- Dynamic Voltage and Frequency Scaling (DVFS) support for the ARM A9 processor cluster
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

10.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

Table 10-3. Power saving design/architecture and power saving techniques

| Techniques | Active SoC Power | Standby SoC Power | System Power |
|---|------------------|-------------------|--------------|
| Temperature Monitoring, and active frequency throttling | √ | | |
| Cortex-A9 Core Platform DVFS | √ | | |
| Cortex-A9 Core Platform SRPG (Software) | | √ | |

Table continues on the next page...

Table 10-3. Power saving design/architecture and power saving techniques (continued)

| Techniques | Active SoC Power | Standby SoC Power | System Power |
|---|------------------|-------------------|--------------|
| Cortex-A9 Core Platform Power Gating | | √ | |
| VPU and GPU3D Power Gating | √ ¹ | √ | |
| Clock gating (automatic dynamic and forced) | √ | | |
| Integrated PMU (IR drop, efficiency, accuracy) | √ | | √ |
| C4 package (IR drop, thermal) | √ | | |
| Display Backlight optimization (IPU, SW) | | | √ |
| Architecture: L2 cache, Video / Audio / Graphics acceleration | √ | | |
| Architecture: SATA, PCIe, HDMI, USB, LVDS integration | | | √ |
| Low Power DDR: LPDDR2, LV-DDR3 | | | √ |

1. Applicable to use cases, where GPU3D and VPU operation is not required.

10.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the ARM domain and the GPU domain, as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See [Temperature Monitor \(TEMPMON\)](#) for further details on temperature monitor functions and programmability options.

10.4.2.3 Peripheral Power management

10.4.2.3.1 Main memory power management

Main system memory, DDR3, and LPDDR2 are some of the most power-hungry system components, but the SoC provides several options to manage DDR power.

Automated power saving modes are supported by the MMDC hardware. This feature allows the DDR memory to automatically enter self-refresh mode when there are no DDR accesses for a configurable time. The default setting is 1024 clock cycles which can be optimized based on the customer use case and application.

See [Power Saving and Clock Frequency Change modes](#) for further details on MMDC power saving features and programmability options.

Software may support DDR frequency scaling. Automated frequency changing procedure is supported by MMDC and CCM modules.

NOTE

DDR frequency changes cost extra time and power. Slowing requestors while keeping DDR at full speed may increase total system power. Software may also implement Cooperative Dynamic Frequency Scaling in order to keep the system balanced, (that is, keep the system in balance when DDR throughput is equal or slightly higher than total amount of requests generated by all requestors).

Reducing the DDR frequency while in DLL-ON mode may be not efficient because:

- Reduction in DDR frequency will cause bus duty cycle to increase and thus reduces chance of automatic MMDC power saving (place memory into SR).
- Total amount of read/write operation does not change (power is per-operation).
- The termination is active longer, though, lowering frequency from 528Mhz to 400MHz or below may enable lowering drive strengths and termination.

When possible at lower performance use cases, software may switch DDR3 to DLL-off mode. This allows it to greatly reduce DDR3 frequency and thus disable or reduce termination and drive strength, which significantly reduces the power consumption of the DDR3 interface.

A good strategy for many types of workloads is to combine most activity in bursts (natively possible, for example, for typical multimedia applications, communication, etc.) and run this segment at maximal speed, then switch to DLL-OFF mode to support background activity (communication, display refresh, housekeeping).

The DRAM Interface power dissipation depends on many variables, however, proper termination and drive strength is key for power and thermal performance. Memory and controllers provide a host of programmable options for the drive strength of the output buffers and for the on-die termination impedance.

The ideal settings for drive strength and ODT also depend on the clock frequency to ensure that inter-symbol interference (ISI) effects are not introduced.

DDR PHY power is proportional to the amount and type of bus activity. For more data on ODT savings, please refer to the Application Note, AN4509 i.MX 6Dual/6Quad Power Consumption.

In cases where the DDR is placed into self-refresh, software can configure DDR I/O to be floated or lowered to the minimum drive allowed by JEDEC.

Modifying the DDR drive strength must be done by code that is executing from a memory region other than DDR (for example, IRAM). No access to DDR (including page table walks, cache misses, alternate bus master accesses, etc.) is allowed while the DDR I/O pads are being re-configured.

10.4.2.3.2 Video-Graphics system power management

10.4.2.3.3 IO power reduction

SW should configure IO to low power modes:

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs
- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)
- Set DDR type IO to CMOS mode if possible, specifically RGMII segment
- Disable all unused LVDS pads (ANALOG, MLB PHY, LDB)

10.4.3 Examples of External Power Supply Interfacing in the i.MX 6Dual/6Quad based systems

This section presents the examples of external power supply interfacing to the chip.

The scenario based on integrated PMU system is presented below. This scenario minimizes BoM and board design complexity.

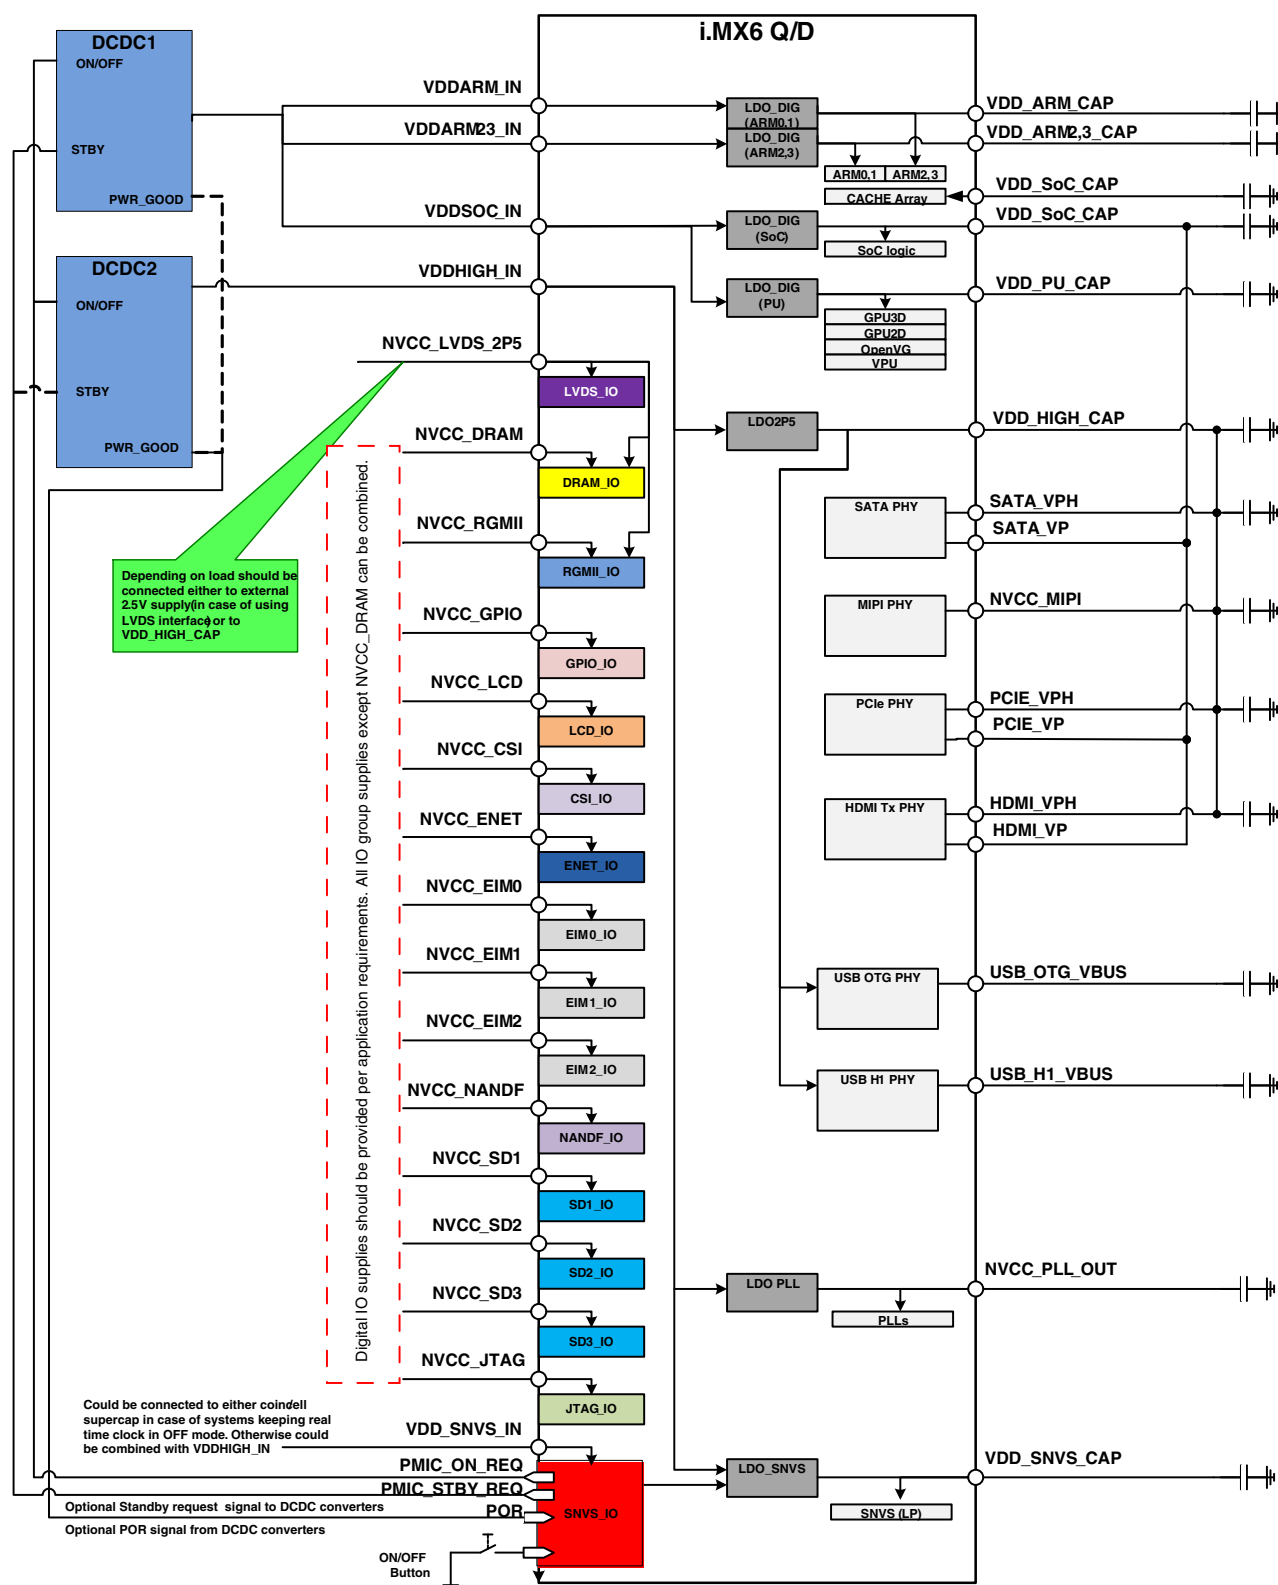

Figure 10-12. Supplying i.MX 6Dual/6Quad power using integrated PMU

The scenario based on external programmable regulators is presented below: This scenario could be used in highly power optimized systems.

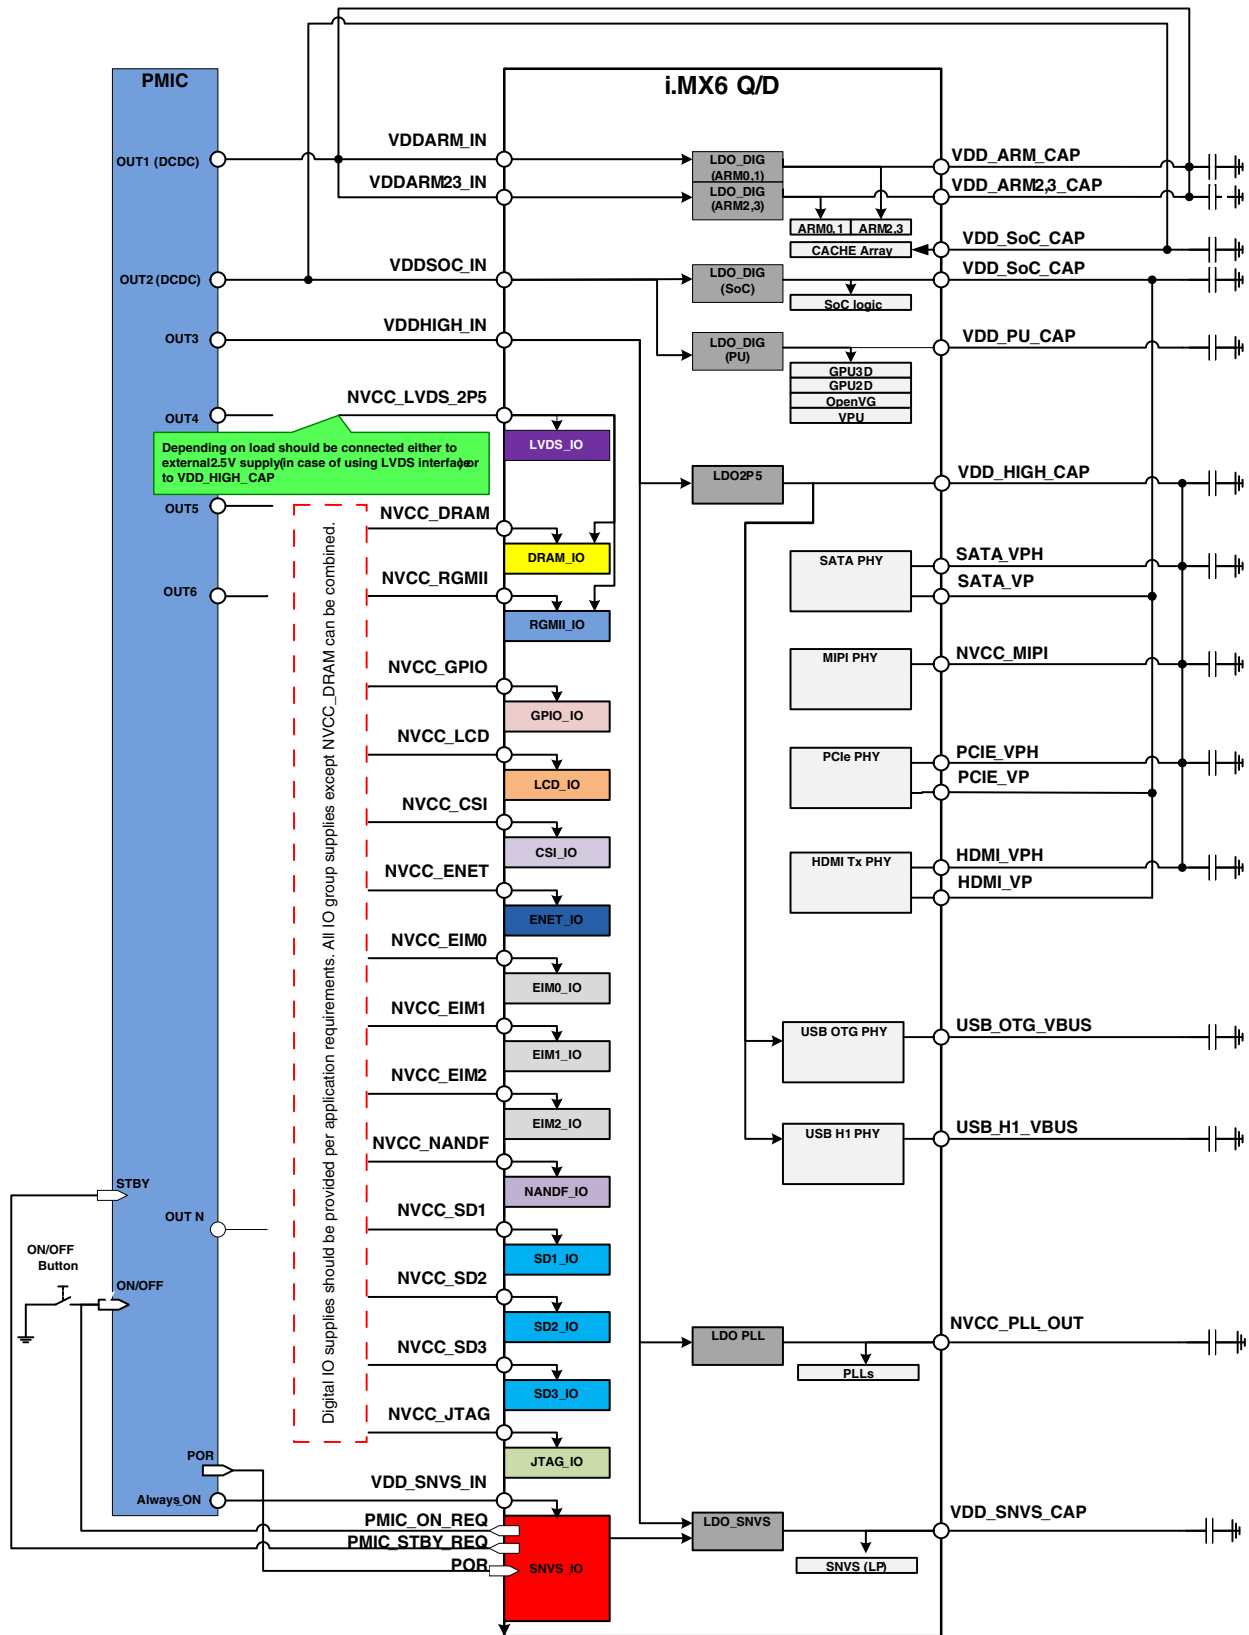

Figure 10-13. Supplying i.MX 6Dual/6Quad Power Using External Programmable PMIC

10.5 ONOFF (Button)

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The button is used to power On and Off the SoC using an always-on (e.g., coincell battery-backed) power domain.

- When the chip main power supply is Off, a button press greater in duration than 750 ms asserts an output signal to request power from a power IC to power up the SoC.
- When the chip main power supply is On, a button press between 750 ms and 5 seconds will send an interrupt to the core to request that software bring down the SoC safely. Software may respond to the interrupt by saving the processor state and then setting a control bit that requests to the power IC the removal of the main power supply.
- Button presses greater than 5 seconds, when the SoC is powered, results in a direct hardware power down request signal to the power IC without providing a software interrupt first. This long button press initiates a hardware-enforced mode which is applicable when software is unable to power Off the device.

The button is connected to input RESET_IN_B and the power IC is connected the chip output PMIC_ON_REQ. The chip must have TEST_MODE deasserted. An always-On supply (e.g. coincell) is needed in the system for this feature.

Chapter 11

System Security

11.1 Overview

Security is a common requirement for platforms built using the i.MX 6Dual/6Quad, although the specific needs vary greatly depending on the platform and market. The type and cost of assets to be protected on a portable consumer device are very different from those to be protected on automotive or industrial platforms, and the same applies to the kind of attacks and level of resources threatening those assets. The platform designer must select an appropriate set of counter measures to meet the relevant platform security needs.

The following figure shows a simplified diagram of the security subsystem.

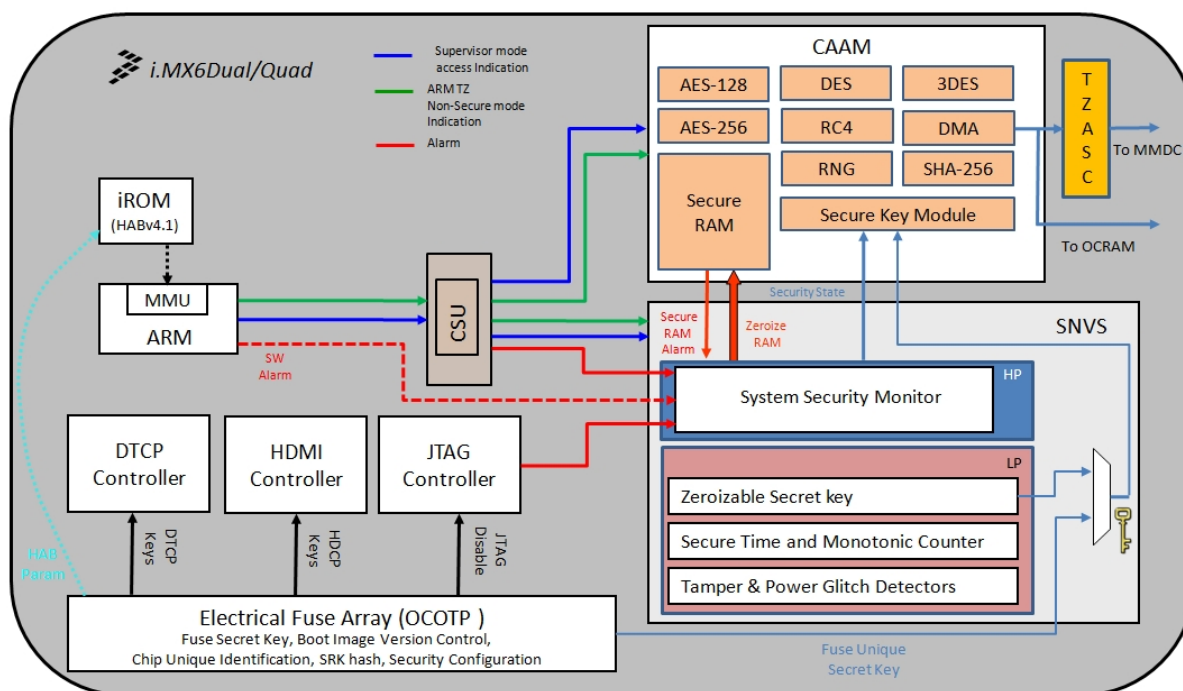

Figure 11-1. Security subsystem (simplified)

For the platform designer to meet the requirements for each market, the i.MX 6Dual/6Quad incorporates a range of security features which can be used individually or in concert to underpin the platform security architecture. Most of the i.MX 6Dual/6Quad security features provide protection against particular kinds of attack and can be configured at various levels according to the required degree of protection. These features are designed to work together and can be integrated with appropriate software to create defensive layers. In addition to protection features, the i.MX 6Dual/6Quad includes a general purpose accelerator to enhance the performance of selected industry standard cryptographic algorithms.

The following is an introduction to the i.MX 6Dual/6Quad security components.

- TrustZone (TZ) Architecture in the ARM Cortex A9 Platform, TrustZone aware Interrupt Controller (GIC) and TrustZone Watchdog Timer (WDOG-2)
- TrustZone Address Space Controller (TZC-380) - providing security address region control functions on DDR memory space.
- On-chip RAM (OCRAM) secure region protection using OCRAM controller.
- High Assurance Boot (HAB) feature in the System Boot
- 16 Kbyte of on-chip Secure RAM
- Encryption algorithms, stream cipher algorithms, hashing algorithms, hardware random number generator and run time integrity checking are all included in the new Cryptographic Acceleration and Assurance Module (CAAM)
- Secure Non Volatile Storage (SNVS)
- On chip OTP (OCOTP) with on-chip electrical fuses
- Central Security Unit (CSU)
- Secure JTAG Controller (SJC)
- Locked mode in the Smart Direct Memory Access (SDMA) controller
- For DTCP (Digital Transmission Content Protection) adopters, DTCP functionality to support DTCP-MOST and DTCP-IP.

Detailed descriptions of the components are provided in the *Multimedia Applications Processor Security Reference Manual for i.MX 6Dual/6Quad and i.MX 6Solo/6DualLite*.

11.2 Central Security Unit (CSU)

11.2.1 CSU Overview

Security is increasingly important for connected devices such as smart phones, tablets, and integrated media players. Instances of hackers and pirates breaking into portable devices stealing private information and copyright content are now commonplace. As such, an embedded trust architecture is an important feature for many new products. To address security risks and to provide an extensible platform to meet stringent security requirements, this processor incorporates a number of advanced security hardware blocks and architectural features. The Central Security Unit (CSU) is one of those hardware blocks.

The CSU manages the system security policy for peripheral access on the SoC. The CSU allows trusted code to set individual security access privileges on each of the peripherals, using one of eight security access privilege levels. Also, according to programmed policy, the CSU may assign bus master security privileges during bus transactions.

11.2.2 CSU Features

The Central Security Unit (CSU) sets access control policies between bus masters and bus slaves, allowing peripherals to be separated into distinct security domains. This protects against unauthorized access to data e.g. when software programs a DMA bus master to access addresses that the software itself is prohibited from accessing directly. Configuring DMA bus master privileges in the CSU consistent with software privileges defends against such attempted accesses.

CSU has the following security related features:

- Peripheral access policy - Appropriate bus master privileges and identity are required to access each peripheral.
- Masters privilege policy - CSU overrides bus master privilege signals, i.e. user/supervisor secure/non-secure, according to access control policy.

11.2.3 CSU Functional Description

The CSU enables secure software to set bus privilege security policy within the platform.

Security policies may be set, and optionally locked in the CSU registers, including the command sequence file (CSF) processed by the High Assurance Boot (HAB) or a HABauthenticated image which executes after the boot ROM.

11.2.3.1 CSU Peripheral Access Policy

According to its programmed policy, the CSU determines the bus master privileges and the masters that are allowed to access each of the slave peripherals.

There are four security modes of operation (i.e. bus privileges) in the system distinguished by security (TrustZone/non-TrustZone) and privilege (Supervisor/User) setting of the module. Below is the list of these security modes from the highest security level to the lowest:

- TrustZone (Secure) Privilege (Supervisor) Mode - Highest Security Level
- TrustZone (Secure) non-Privilege (User) Mode - Medium Security Level
- non-TrustZone (Regular) Privilege (Supervisor) Mode - Medium Security Level
- non-TrustZone (Regular) non-Privilege (User) Mode - Lowest Security Level

This functionality is implemented as follows:

The Configure Slave Level (CSL) Register value for a specified peripheral resource defines the output signal -- `csu_sec_level` for that peripheral. The value of this signal determines by what master privileges a peripheral is accessible. The relationship between the value of the `csu_sec_level` signal and security operation mode is shown in the table below. The CSL registers reside in the CSU module. Details, describing CSL register fields and how they are programmed to control access privileges for specific peripherals, can be found in the Security Reference Manual (see System Security Overview section).

Table 11-1. Permission Access Table

| CSU_SEC_LEVEL[2:0] | Non-Secure User Mode | Non-Secure Spvr Mode | Secure (TZ) User Mode | Secure (TZ) Spvr Mode | CSL register value |
|--------------------|----------------------|----------------------|-----------------------|-----------------------|--------------------|
| (0) 000 | RD+WR | RD+WR | RD+WR | RD+WR | 8'b1111_1111 |
| (1) 001 | None | RD+WR | RD+WR | RD+WR | 8'b1011_1011 |
| (2) 010 | RD | RD | RD+WR | RD+WR | 8'b0011_1111 |
| (3) 011 | None | RD | RD+WR | RD+WR | 8'b0011_1011 |
| (4) 100 | None | None | RD+WR | RD+WR | 8'b0011_0011 |
| (5) 101 | None | None | None | RD+WR | 8'b0010_0010 |
| (6) 110 | None | None | RD | RD | 8'b0000_0011 |
| (7) 111 | None | None | None | None | Any other value |

11.3 Cryptographic Acceleration and Assurance Module (CAAM)

11.3.1 CAAM Overview

CAAM is a cryptographic acceleration device that accelerates block encryption algorithms, stream cipher algorithms, hashing algorithms, and random number generation. It has an integral DMA engine that allows CAAM to fetch its command programs, read input data and write the resulting output.

CAAM works with the SNVS to provide platform assurance features, including support for High Assurance Boot, detection of and response to potential tamper events, and short-term and long-term protection of secret data such as public keypairs, Digital Rights Management keys and proprietary software.

CAAM provides the following features:

- Cryptographic acceleration of hashing, encryption and decryption
- Offloading of cryptographic functions via programmable command descriptor language
- Two independent queues for commands and results
- Register Bus Interface used for configuration, control and status
- DMA, including scatter/gather support for data
- Automatic short-term encryption/decryption of cryptographic keys
- Long-term protection of secret data via device-specific encryption keys
- Secure Memory for access-controlled protection of critical data, and automatic zeroization in the case of tampering
- Random Number Generation using a true random number generator and a NISTcompliant pseudo random number generator

11.4 Secure Non-Volatile Storage (SNVS)

11.4.1 SNVS Overview

SNVS is a hardware device that includes a security state machine and security violation detection circuits that, together with High Assurance Boot software, determine whether the chip is currently in a secure state.

When the security state machine indicates a secure state, the SNVS allows CAAM to use special cryptographic keys to decrypt long-term secrets such as public keypairs, Digital Rights Management keys and proprietary software. When the SNVS detects a potential

security violation, such as a tamper alert, the SNVS signals CAAM to erase sensitive data such as cryptographic keys, and sends an interrupt to alert the Operating System of the event. The SNVS also includes a non-security-related real-time counter.

The SNVS includes the following features:

- Security State Machine driven by High Assurance Boot software and tamper detection circuits
- Master Key Control that protects the integrity and secrecy of the Master Key stored in fuses
- Tamper detection circuits that detect JTAG scan events, power glitches, Master Key ECC check failure, and software-reported and hardware-reported security violations
- Zeroizable Master Key that can be automatically erased in the event of a security breach
- Tamper-protected Secure Realtime Counter that continues running when the chip is powered off
- Non-volatile Monotonic Counter used to protect against “roll-back” attacks
- Non-volatile General Purpose Register can be used to store a 32-bit value across power cycles
- Non-Secure Real Time Counter with programmable alarm and periodic interrupt

11.4.2 Tamper Detection

Tamper Detection is a special mechanism provided through a chip pin to help protect the target system “box” against unauthorized opening or tampering.

When not in use, the Tamper Detection signal is pulled-down internally. In case of use, it should be connected to a Tamper Detection contact in a target system (Normally closed, pulled-up to the VDD_SNVS_IN).

An always-ON power supply (coin cell) should be present in the system. If the tamper detection feature is enabled by software then opening of the tamper contact:

- Switches system power ON with a Tamper Detection alarm interrupt asserted (for software reaction)
- May activate security related hardware (e.g. erasure of the Zeroizable Master Key and secure memory contents)

11.5 High Assurance Boot (HAB)

>HAB, which is the high assurance boot feature in the system boot ROM, protects the platform from executing unauthorized software (malware) during the boot sequence.

When unauthorized software is permitted to gain control of the boot sequence, it can be exploited for a variety of goals, such as exposing stored secrets; circumventing access controls to sensitive data, services, or networks; or repurposing the platform.

Unauthorized software can enter the platform during upgrades or reprovisioning, or when booting from USB connections or removable devices.

HAB protects against unauthorized software by:

- Using digital signatures to recognize authentic software. This allows the user to boot the device to a known initial state, running software signed by the device manufacturer.

11.6 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the ARM processor and the system bus. This allows program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution. System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary scan) testing.

SJC provides the following security levels:

- JTAG Disabled-JTAG use is permanently blocked.
- No-Debug-All security sensitive JTAG features are permanently blocked.
- Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- JTAG Enabled-JTAG use is unrestricted.

Security levels are selected via e-fuse configuration.

Chapter 12

ARM Cortex A9 MPCore Platform (ARM)

12.1 Overview

The Cortex-A9 Core Platform consists of an ARM[®]Cortex[®]-A9 MPCore processor, which includes a Neon co-processor, a private timer and watch-dog, and 32 KB + 32 KB L1 data and instruction caches per core.

The Cortex-A9 Core Platform consists of a unified 1 MB L2 cache, SCU (Snoop Control Unit), and Generic Interrupt Controller (GIC). In addition, the Cortex-A9 Core Platform includes various components composing the ARM CoreSight debug/Trace system, including PTM and a 3 / 5¹ x CTI, 2xCTM, and 16KB ETB.

The Cortex-A9 processor utilizes two AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

The core supports debug through real-time trace via PTM, and static debug via JTAG.

The core platform supports static debug through the debug logic to SOC. This includes the capability of real time trace via ARM's CoreSight PTM, ETB and TPIU modules. The CTI and CTM modules allow cross-triggering of internal and external trigger sources.

12.2 External Signals

The following table describes the external signals of ARM:

Table 12-1. ARM External Signals

| Signal | Description | Pad | Mode | Direction |
|------------|--------------------|--------|------|-----------|
| ARM_EVENTI | Input event signal | GPIO_5 | ALT7 | I |

Table continues on the next page...

1. Depending on specific part: i.MX 6Dual, i.MX 6Quad.

Table 12-1. ARM External Signals (continued)

| Signal | Description | Pad | Mode | Direction |
|---------------|---------------------|--------------|------|-----------|
| ARM_EVENTO | Output event signal | CSI0_PIXCLK | ALT7 | O |
| ARM_TRACE00 | Trace signal | CSI0_VSYNC | ALT7 | O |
| ARM_TRACE01 | Trace signal | CSI0_DAT4 | ALT7 | O |
| ARM_TRACE02 | Trace signal | CSI0_DAT5 | ALT7 | O |
| ARM_TRACE03 | Trace signal | CSI0_DAT6 | ALT7 | O |
| ARM_TRACE04 | Trace signal | CSI0_DAT7 | ALT7 | O |
| ARM_TRACE05 | Trace signal | CSI0_DAT8 | ALT7 | O |
| ARM_TRACE06 | Trace signal | CSI0_DAT9 | ALT7 | O |
| ARM_TRACE07 | Trace signal | CSI0_DAT10 | ALT7 | O |
| ARM_TRACE08 | Trace signal | CSI0_DAT11 | ALT7 | O |
| ARM_TRACE09 | Trace signal | CSI0_DAT12 | ALT7 | O |
| ARM_TRACE10 | Trace signal | CSI0_DAT13 | ALT7 | O |
| ARM_TRACE11 | Trace signal | CSI0_DAT14 | ALT7 | O |
| ARM_TRACE12 | Trace signal | CSI0_DAT15 | ALT7 | O |
| ARM_TRACE13 | Trace signal | CSI0_DAT16 | ALT7 | O |
| ARM_TRACE14 | Trace signal | CSI0_DAT17 | ALT7 | O |
| ARM_TRACE15 | Trace signal | CSI0_DAT18 | ALT7 | O |
| ARM_TRACE_CLK | Clock signal | CSI0_DATA_EN | ALT7 | O |
| ARM_TRACE_CTL | Control signal | CSI0_MCLK | ALT7 | O |

12.3 Platform configuration

The i.MX 6Dual/6Quad [Bus](#), [Cortex A9 Core](#), and [L2 Cache](#) configuration options are contained in the following subsections.

Table 12-2. Cortex-A9 revision

| | |
|-------|-----------------------------|
| Core | MP004-BU-50000-r2p10-0rel0 |
| Neon | AT397-BU-50001- r2p0-00rel0 |
| PL310 | PL310-BU-00000-r3p1-50rel0 |

12.3.1 Platform and SCU configuration

Table 12-3. Cortex-A9 configuration

| Option | Selected Value | Comments |
|-----------------------|------------------|--|
| MP_MODE | Yes | Multi-Processor mode |
| POWER_DOMAIN_WRAPPER | No | Wrappers to support power off of individual cores. |
| PTM_INTERFACE_PRESENT | Yes | Use PTM as part of Trace/Debug logic. |
| PARITY | Yes | Using RAM arrays which support parity. |
| CORE_NUM | 2/4 ¹ | Number of cores |
| INT_NUM | 128 | Number of interrupts (SPIs) in GIC |
| ACP_PRESENT | No | Accelerator Coherency Port (ACP) |
| MASTER_NUM | 2 | Number of 64-bit AXI output master ports. |

1. Depending on type of part - i.MX 6Dual, i.MX 6Quad.

12.3.2 Core configuration

Table 12-4. Cortex-A9 Core configuration

| Option | Selected Value | Comments |
|------------------------|----------------|---|
| DCACHESIZE | 32 | L1 Data cache size |
| ICACHESIZE | 32 | L1 Instruction cache size |
| TLBSIZE | 128 | |
| JAZELLE_PRESENT | Yes | Providing ARM's Jazelle technology hardware extensions. |
| FPU_PRESENT | No | The FPU functions are provided by NEON, thus additional FPU cannot be used. |
| NEON_PRESENT | Yes | Use MPE, NEON Co-Processor and FPU |
| PRELOAD_ENGINE_PRESENT | No | May only be beneficial in Video processing. |

12.3.3 PL310 L2 Cache configuration

Table 12-5. PL310 L2 Cache configuration

| Option | Selected Value | Comments |
|----------------------|----------------|---|
| Cache way size | 64 KB | (For total of 1 MB L2 size) |
| Number of cache ways | 16 | Performance enhancement versus 8 ways |
| RAM latencies | 4 ¹ | |
| Data RAM banking | Yes | Significantly improves cache throughput |

Table continues on the next page...

Table 12-5. PL310 L2 Cache configuration (continued)

| Option | Selected Value | Comments |
|-----------------------|----------------|--|
| Slave port 1 present | Yes | |
| Master port 1 present | Yes | |
| Parity logic | Yes | For military / surveillance applications, and side ease the process of identify memory related issues. |
| Lockdown by master | Yes | Increase L2 optimization |
| Lockdown by line | Yes | Increase L2 optimization |
| AXI ID width | 5 | |
| Address filtering | No | Help in timing closure, not required for symmetric AXI bus connectivity scheme. |
| Speculative read | Yes | Performance boost, when used with CortexA9. |
| Size of L2 cache | 1 MB | Size is implied by Cache-Size times cache-ways (i.e. 1 MB) |

1. Preliminary estimate, final value TBD.

12.3.4 Endian Modes

The Cortex-A9 Core Platform supports little endian mode only. Big Endian is not supported even though both modes are supported by the Cortex-A9 processor.

12.3.5 Memory Parity error support

The i.MX 6Dual/6Quad ARM Cortex A9 MPCore™ platform supports Parity Fail signals for several of the RAM arrays.

Parity fail indication is provided by "PARITYFAILn[7:0]" and "PARITYFAILSCU[N:0]" buses for system notification. On parity error event, these signals will be ORed together to provide a single event (interrupt) to the core, in case of any parity fail event.

12.4 Performance and Power

This section will discuss the operational conditions and performance goals for the Cortex-A9 Core Platform.

12.4.1 Low-Power design

The Cortex-A9 Core Platform low-power design is based on these characteristics:

- Symmetric processing and ARM design by using the same clock frequency on cores
- Low leakage of LP process
- C4 package

As a result, the proposed power modes and power management scheme is as follows:

- The same voltage level must be used for the logic part of the whole platform.
- Separate voltage for memories array is required to allow DVFS.
- On-chip power switches are not utilized by gating the power of the platform directly from the regulator.

12.4.1.1 SRPG (State Retention Power Gating)

ARM core SRPG is implemented by software save & restore of essential configuration registers prior to the complete power-down of the entire ARM platform.

Save & restore utilizes "Dormant mode" for the primary core (L1 cache flushed, L2 preserved), and power down mode of all other cores, as follows:

Power Down flow⁴

- Power down request
- Save cores' essential registers and platform registers to L2/DDR memory by Dormant mode routines.
- Perform L1 cache clean operation on all cores
- Enter WFI state
- Power Gating of all cores' and platform logic

Power Up flow⁴

- Power up request to GPC external controller (interrupt)
- Supply power
- Reset
- Restore registers of platform and cores from memory by Dormant mode routines.

12.4.1.2 Dynamic Voltage and Frequency Scaling (DVFS)

The Cortex-A9 Core Platform has been designed, in conjunction with external control logic and software, to support dynamic scaling of voltage and frequency.

2. Dormant mode implementation information, provided by ARM, is preliminary.

12.4.2 Clocks, frequency goals

12.4.2.1 ARM Clock

For ARM clock please see the product data sheet.

12.4.2.2 Bus Clocks

The AXI master ports are designed to run at half the frequency of the Cortex A9 core clock.

The on-platform debug components clock is asynchronous to the ARM core clock.

12.4.2.3 Debug Clocks

The ARM platform contains several debug components.

Their clock frequencies are as follows:

- Trace buffer (ETB) clock - 133 MHz
- Trace port (TPIU) clock - 133 MHz
- AHB clock - 133 MHz

12.5 Core Platform Sub-Blocks details

12.5.1 ARM Cortex A9 MPCore™ Processor

The information presented in this section focuses on design aspects of the ARM Cortex A9 MPCore™ in the AP subsystem.

The ARM Cortex A9 is a high-performance, low-power, synthesisable processor with an L1 cache subsystem that provides full virtual memory capabilities. The Cortex A9 processor implements the ARMv7-A architecture and runs 32-bit ARM instructions, 16-bit and 32-bit Thumb2 instructions, and 8-bit Java™ byte-codes in Jazelle state.

The ARM Cortex A9 MPCore™ processor in the chip consists of:

- Four (4) Cortex A9 processors in a cluster and a Snoop Control Unit (SCU) that can be used to ensure coherency within the cluster.

- A set of private memory-mapped peripherals, including a global timer and a watchdog and private timer for each Cortex-A9 processor present in the cluster.
- An integrated Interrupt Controller is an implementation of the Generic Interrupt Controller architecture. The integrated Interrupt Controller registers sit beside the timers and watchdog control registers in the private memory region of the Cortex-A9 MPCore.

Individual Cortex-A9 processors in the Cortex-A9 MPCore cluster are symmetrically implemented with hardware configurations as specified in [Platform configuration](#).

12.5.2 Media Processing Engine (MPE - NEON)

The Media Processing Engine (MPE) implements ARM NEON technology, a media and signal processing architecture that adds instructions targeted at audio, video, 3-D graphics, image, and speech processing.

Advanced SIMD instructions are available in both ARM and Thumb states. The MPE also implements a VFPv3-D32 Floating-Point Unit.

The ARM Cortex A9 MPCore™ Platform includes MPE per core.

12.5.3 Generic Interrupt Controller (GIC)

The Cortex-A9 MPCore contains an integrated interrupt controller that shares the same programmer's model as the PL390 (GIC), although there are implementation-specific differences.

12.5.3.1 Interrupt Controller Features

- 128 interrupt sources
- The Cortex-A9 multiprocessor contains the following types of interrupts:
 - Up to 16 Software Generated Interrupts (SGIs)
 - Private Peripheral Interrupt (PPI) - an interrupt generated by a peripheral that is specific to a single Cortex-A9 processor (there are 5 PPIs for each Cortex-A9 processor interface)

- Shared Peripheral Interrupt (SPI) - an interrupt generated by a peripheral which the Interrupt Controller can route to any or all Cortex-A9 processor interfaces. The Interrupt Controller supports a maximum of 224 SPIs (the i.MX 6Dual/6Quad controller is configured for 128 interrupts).
- Lockable Shared Peripheral Interrupts (LSPI) - there are 31 LSPIs, interrupts 32-62. The user can configure and then lock these interrupts against further change using CFGSDISABLE. The LSPIs are present only if the SPIs are present.

For more information, see ARM MPCORE Technical Reference Manual.

12.5.3.2 About the Interrupt Controller

The Interrupt Controller is a single functional unit that is located in a Cortex-A9 multiprocessor design.

The Interrupt Controller is memory-mapped. The Cortex-A9 processors access it by using a private interface through the SCU.

12.5.3.3 Interrupt Controller Clock frequency

The interrupt controller's clock period is 2x multiple of the main clock period.

The watchdogs and timers use the same clock as the interrupt controller.

12.5.3.4 TrustZone support

The Interrupt Controller permits all implemented interrupts to be individually defined as Secure or Non-secure.

The user can program Secure interrupts to use either the IRQ or FIQ interrupt mechanism of a Cortex-A9 processor through the FIQen bit in the ICPICR Register.

Non-secure interrupts are always signalled using the IRQ mechanism of a Cortex-A9 processor.

12.5.4 Instruction and data caches (L1)

The Cortex-A9 processor is configured with a 32 Kbyte Instruction Cache and a 32 Kbyte Data Cache.

12.5.4.1 L1 features

- Four-way set associative cache
- Virtually indexed and physically addressed
- Capable of providing two words per cycle for all requesting sources
- Eight 32-bit words per cache line
- 128 indexes per tag RAM

12.5.5 L2 Cache and controller (PL310)

The ARM Cortex A9 MPCore™ platform includes 1MB unified (data / instruction) L2 cache unit, based on the PL310 cache controller IP by ARM.

The Cortex-A9 processor utilizes 2x AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

See [Table 12-5](#) for more information.

12.6 Debug and Trace Sub-blocks (CoreSight components)

This section gives a brief overview of the modules that are implemented within the Cortex-A9 Core Platform.

The Cortex-A9 Core Platform debug blocks are part of the overall CoreSight debug system which include the 16KB ETB, 2 x CTM's, 3 / 5³ x CTI's, ATB replicator, DAP, TPIU and APB address decode.

The CoreSight™ compatible Program Flow Trace Macrocell (PTM) provides control for ARM software tracing and debug. The Cross Trigger Interface (CTI) is included in the Cortex-A9 platform to provide a common programming model for use by the debug tools, control the trigger sources, and interface to the Cross Trigger Matrix (CTM). The debug is controlled via an ARM Debug Access Port (DAP).

For details of the full CoreSight debug subsystem, see the [System Debug](#) chapter.

3. Depending on specific part: i.MX 6Dual, i.MX 6Quad.

12.6.1 Debug Access Port (DAP)

The Debug Access Port (DAP) is an implementation of an ARM Debug Interface version 5.1 (ADIV5.1) comprised of a number of components supplied in a single configuration.

All the supplied components fit into the various architectural components for Debug Ports (DPs), which are used to access the DAP from an external debugger and Access Ports (APs), to access on-chip system resources.

The debug port and access ports together are referred to as the DAP. The DAP provides real-time access for the debugger without halting the processor to:

- AMBA system memory and peripheral registers
- All debug configuration registers

The DAP also provides debugger access to JTAG scan chains of system components, (to non-CoreSight compliant processors, for example).

12.6.2 Program Trace Macrocell (PTM)

The PTM unit is a nonintrusive trace macrocell that filters and compresses instruction trace for use in system debugging and system profiling.

The PTM unit has an external interface outside of the processor called the *Advanced Trace Bus* (ATB) interface. The PTM is an evolution of the ETM, designed for the Cortex A9 cores, handling program trace only.

The Cortex A9 PTM provides real time instruction trace for the Cortex A9. It's designed to be used with the CoreSight Design Kit.

Real time tracing is controlled by specifying a set of filtering and triggering resources which include address and data comparators, counters and sequencers.

Two main schemes can be used for connecting PTMs:

1. Single PTM - shared by all cores and resources.
2. Nx PTMs, where N is numbers of cores in the system.

12.6.2.1 Program Flow Trace (PFT)

The CoreSight Program Flow Trace Macrocell (PTM) is based on the Program Flow Trace (PFT) architecture. The PTM generates information that trace tools use to reconstruct the execution of all or part of a program.

The PFT architecture assumes the trace tools can access a copy of the code being traced. For this reason, the PTM generates trace only at certain points in program execution, called waypoints. This reduces the amount of trace data generated by the PTM compared to the ETM protocol. Waypoints are changes in the program flow or events, such as an exception. The trace tools use waypoints to follow the flow of program execution.

For full reconstruction of the program flow, the PTM traces:

- Indirect branches, with target address and condition code
- Direct branches with only the condition code
- Instruction barrier instructions
- Exceptions, with indication of where the exception occurred
- Changes in processor instruction set state
- Changes in processor security state
- Context-ID changes
- Entry to and return from Debug state when Halting Debug-mode is enabled

You can also configure the PTM to trace:

- Cycle count between traced waypoints
- Global system timestamps
- Target addresses for taken direct branches

PTM components include the following main components:

- Processor Interface to monitor the behavior of the processor.
- Trace Generation to create a real-time trace stream.
- Filtering and Triggering Resources used to affect when trace is generated and to control the capturing of trace by the trace tools.
- Main FIFO (72 bytes) flattens out any bursts in the trace stream, and signals an overflow in the trace when it becomes full, halting trace generation until the FIFO empties.
- ATB interface for PTM output.
- APB interface to access the PTM registers.

12.6.3 Cross Trigger Interface (CTI)

This block controls the Trigger Interface (TI). The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events.

When the CTI receives a channel event, it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the TI. Each CTI has 3/5 trigger inputs.

See [System Debug](#) for more information on the CTI.

12.6.4 Embedded Trace Buffer (ETB)

The ETB provides on-chip storage of trace data using 32-bit, 16KB RAM.

The ETB accepts trace data from the Cortex-A9 PTM via an ATB port (passing through a replicator in between). Providing an on-chip buffer alleviates the pin count, bandwidth, and pad design requirements associated with sending trace data to a debugger directly through package pins in near real-time.

Features:

- 16 KB compiled memory for the trace buffer and can be used as general purpose memory
- AMBA Peripheral Bus programming interface for configuration and memory access

12.6.4.1 AMBA Trace Bus (ATB) Replicator

The ATB Replicator enables two trace sinks (ETB and an off platform port generally connected to a Trace Port Interface Unit-TPIU) to be wired together and receive ATB trace data from the same trace source (PTM).

There are no programmable registers. It takes incoming trace data from a single source (PTM) and replicates it as multiple masters.

Chapter 13

AHB to IP Bridge (AIPSTZ)

13.1 Overview

This section provides an overview of the AHB to IP Bridge (AIPSTZ). The peripheral bridge acts as an interface between the system bus and lower bandwidth IP Slave (IPS) bus peripherals.

13.1.1 Features

The following list summarizes the key features of the bridge:

- The bridge supports the IPS slave bus signals. This interface is only meant for slave peripherals.
- The bridge supports 8-, 16-, and 32-bit IPS peripherals. (Accesses larger than the size of a peripheral are not supported, except to 32-bit memory.)
- The bridge supports a pair of IPS accesses for 64-bit and certain misaligned AHB transfers to 32-bit memory in 64-bit platforms.
- The bridge directly supports up to 32 16-Kbyte external IPS peripherals, and 2 global external IPS peripheral spaces. The bridge occupies 1 MBytes of total address space.
- The bridge provides configurable per-block and per-master access protections. More details on the protection features and configuration can be found in the Security Reference Manual
- Peripheral read transactions require a minimum of 2 hclk clocks, and unbuffered write transactions require a minimum of 3 hclk clocks.
- The bridge uses one single asynchronous reset and one global clock.

13.2 Clocks

The following table describes the clock sources for AIPSTZ. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 13-1. AIPSTZ Clocks

| Clock name | Clock Root | Description |
|------------|--------------|--------------|
| hclk | ahb_clk_root | Module clock |

13.3 General Operation

The AHB to IP bridge is the interface between the AHB and on-chip IPS peripherals, which are sub-blocks containing readable/writable control and status registers.

The AHB master reads and writes these registers through the AIPSTZ. The bridge generates block enables, the block address, transfer attributes, byte enables and write data as inputs to the IPS peripherals. The bridge captures read data from the IPS interface and drives it on the AHB.

It occupies a 1-Mbyte portion of the address space. The register maps of the IPS peripherals are located on 16-Kbyte boundaries. Each IPS peripheral is allocated one 16K-byte block of the memory map, and is activated by one of the block enables from the bridge. Up to thirty-two 16-Kbyte external IPS peripherals may be implemented, occupying contiguous blocks of 16 Kbytes. Two global external IPS block enables are available for the remaining address space to allow for customization and expansion of addressed peripheral devices. In addition, a single "non-global" block enable is also asserted whenever any of the thirty-two non-global block enables is asserted.

The bridge is responsible for indicating to IPS peripherals if an access is in supervisor or user mode. It may block user mode accesses to certain IPS peripherals or it may allow the individual IPS peripherals to determine if user mode accesses are allowed. In addition, peripherals may be designated as write-protected.

The bridge supports the notion of "trusted" masters for security purposes. Masters may be individually designated as trusted for reads, trusted for writes, or trusted for both reads and writes, as well as being forced to look as though all accesses from a master are in user-mode privilege level. Refer to [AIPSTZ Memory Map/Register Definition](#) for more information.

All peripheral devices are expected to only require aligned accesses equal to or smaller in size than the peripheral size. An exception to this rule is supported for 32-bit peripherals to allow memory to be placed on the IPS.

13.4 Functional Description

The AIPS bridge serves as a protocol translator between the AHB system bus and the IP bus.

Support is provided for generating a pair of 32-bit IP bus accesses when targeted by a 64-bit system bus access, or a misaligned access which crosses a 32-bit boundary. No other bus-sizing access support is provided.

13.5 Access Protections

The AIPSTZ bridge provides programmable access protections for both masters and peripherals. It allows the privilege level of a master to be overridden, forcing it to user-mode privilege, and allows masters to be designated as trusted or untrusted.

Peripherals may require supervisor privilege level for access, may restrict access to a trusted master only, and may be write-protected. IP bus peripherals are subject to access control policies set in both CSU registers and AIPSTZ registers. An access is blocked if it is denied by either policy.

13.6 Access Support

Aligned 64-bit accesses, aligned and misaligned word and half word accesses, as well as byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the IPS.

Peripheral registers must not be misaligned, although no explicit checking is performed by the AIPS bridge. The bridge will perform two IPS transfers for 64-bit accesses, word accesses with byte offsets of 1, 2, or 3, and for half word accesses with a byte offset of 3. All other accesses will be performed with a single IPS transfer.

Only aligned half word and byte accesses are supported for 16-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

Only byte accesses are supported for 8-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

13.7 Initialization Information

The AIPS bridge should be programmed before use.

The following registers should be initialized: The Master Privilege Registers (AIPSTZ_MPRs), the Peripheral Access Control registers (AIPSTZ_PACRs), and the Off-platform Peripheral Access Control registers (AIPSTZ_OPACRs) described in [AIPSTZ Memory Map/Register Definition](#).

13.7.1 Security Block

The AIPSTZ contains a security block that is connected to each off-platform peripheral. This block filters accesses based on write/read, non-secure, and supervisor signals.

Each peripheral can be individually configured to allow or deny each of the following transactions as described in the table below:

Table 13-2. Peripheral Access Configuration options

| Config Bit | Write | Non-Secure | Supervisor | Meaning |
|------------|-------|------------|------------|-----------------------------|
| 0 | 0 | 0 | 0 | Secure User Read |
| 1 | 0 | 0 | 1 | Secure Supervisor Read |
| 2 | 0 | 1 | 0 | Non-Secure User Read |
| 3 | 0 | 1 | 1 | Non-Secure Supervisor Read |
| 4 | 1 | 0 | 0 | Secure User Write |
| 5 | 1 | 0 | 1 | Secure Supervisor Write |
| 6 | 1 | 1 | 0 | Non-Secure User Write |
| 7 | 1 | 1 | 1 | Non-Secure Supervisor Write |

Each peripheral has a security configuration (sec_config_X) input for determining whether to allow or deny a given access type. These are 8-bit vectors, with each bit corresponding to one of the transactions above as listed in the Config Bit column of [Table 13-2](#). If the bit is asserted (1'b1), the transaction is allowed. If the bit is negated (1'b0), the transaction is not allowed.

For example, if peripheral 0 is configured as follows:

sec_config_0 [7:0] = 8'b0011_0011

This peripheral can only be accessed by secure transactions. Bits 0, 1, 4, and 5 are asserted and these bits refer to the four types of secure transactions. If an insecure transaction is attempted to this peripheral, it will result in an error.

Eight bits per peripheral across an entire system can result in a large number of configuration bits that must be assigned and controlled, most likely in a series of registers in another block. To reduce the number of register bits required predefined sets of security profiles can be defined and encapsulated in an external security translation block. The table below describes one set of security profiles that has been proposed for use with the AIPSTZ.

Table 13-3. Security Levels

| CSU_SEC_LEVEL | Non-Secure User | Non-Secure Supervisor | Secure User | Secure Supervisor |
|---------------|-----------------|-----------------------|-------------|-------------------|
| 0 | RD+WR | RD+WR | RD+WR | RD+WR |
| 1 | NOT ALLOWED | RD+WR | RD+WR | RD+WR |
| 2 | Read Only | Read Only | RD+WR | RD+WR |
| 3 | NOT ALLOWED | Read Only | RD+WR | RD+WR |
| 4 | NOT ALLOWED | NOT ALLOWED | RD+WR | RD+WR |
| 5 | NOT ALLOWED | NOT ALLOWED | NOT ALLOWED | RD+WR |
| 6 | NOT ALLOWED | NOT ALLOWED | Read Only | Read Only |
| 7 | NOT ALLOWED | NOT ALLOWED | NOT ALLOWED | NOT ALLOWED |

Information regarding CSU is provided in the Security Reference Manual. Contact your Freescale representative for information about obtaining this document.

A 3-bit input, 8-bit output translation block can be used such that only three register bits are required to set the security profile and the translation block will drive the correct 8-bit configuration vector. Each peripheral connected to the AIPSTZ would require this translation block. The top level AIPSTZ has this three bit input line `csu_sec_level[2:0]' corresponding to each peripheral X.

13.8 AIPSTZ Memory Map/Register Definition

The memory map for the AIPS SW-visible registers is shown in the table below.

The MPROT and OPACR fields are 4 bits in width. Some bits may be reserved depending on device.

AIPSTZ memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|---|-----------------|--------|-------------|----------------------------|
| 200_0000 | Master Priviledge Registers (AIPSTZ1_MPR) | 32 | R/W | 0496_ED40h | 13.8.1/584 |
| 200_0040 | Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR) | 32 | R/W | 4444_4444h | 13.8.2/586 |
| 200_0044 | Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR1) | 32 | R/W | 4444_4444h | 13.8.3/590 |
| 200_0048 | Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR2) | 32 | R/W | 4444_4444h | 13.8.4/593 |
| 200_004C | Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR3) | 32 | R/W | 4444_4444h | 13.8.5/596 |
| 200_0050 | Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR4) | 32 | R/W | 4444_4444h | 13.8.6/599 |
| 210_0000 | Master Priviledge Registers (AIPSTZ2_MPR) | 32 | R/W | 0496_ED40h | 13.8.1/584 |
| 210_0040 | Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR) | 32 | R/W | 4444_4444h | 13.8.2/586 |
| 210_0044 | Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR1) | 32 | R/W | 4444_4444h | 13.8.3/590 |
| 210_0048 | Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR2) | 32 | R/W | 4444_4444h | 13.8.4/593 |
| 210_004C | Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR3) | 32 | R/W | 4444_4444h | 13.8.5/596 |
| 210_0050 | Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR4) | 32 | R/W | 4444_4444h | 13.8.6/599 |

13.8.2 Master Priviledge Registers (AIPSTZx_MPR)

Each AIPSTZ_MPR specifies 16 4-bit fields defining the access privilege level associated with a bus master in the platform, as well as specifying whether write accesses from this master are bufferable shown in [Table 13-6](#)

The registers provide one field per bus master, where field 15 corresponds to master 15, field 14 to master 14,... field 0 to master 0 (typically the processor core). The master index allocation is shown in [Table 13-7](#).

Table 13-16. MPROT Field

| Bit | Field | Description |
|-----|-------|--|
| 3 | MBW | Master Buffer Writes - This bit determines whether the AIPSTZ is enabled to buffer writes from this master. |
| 2 | MTR | Master Trusted for Reads - This bit determines whether the master is trusted for read accesses. |
| 1 | MTW | Master Trusted for Writes - This bit determines whether the master is trusted for write accesses. |

Table continues on the next page...

Table 13-16. MPROT Field (continued)

| Bit | Field | Description |
|-----|-------|--|
| 0 | MPL | Master Privilege Level - This bit determines how the privilege level of the master is determined. |

NOTE

The reset value is set to 0000_0000_7700_0000, which makes master 0 and master 1 (ARM CORE) the trusted masters. Trusted software can change the settings after reset.

Table 13-17. Master Index Allocation

| Master Index | Master Name | Comments |
|--------------|---|-----------------------------------|
| Master 0 | All masters excluding ARM core, SDMA and CAAM | Share the same number allocation. |
| Master 1 | ARM CORE | |
| Master 2 | CAAM | |
| Master 3 | SDMA | |
| Master 4-15 | Reserved | |

Address: Base address + 0h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

13.8.3 Off-Platform Peripheral Access Control Registers (AIPSTZx_OPACR)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ_OPACR has the following format shown in [Table 13-9](#)

Table 13-19. OPAC Field

| Bit | Field | Description |
|-----|-------|---|
| 3 | BW | Buffer Writes - This bit determines whether write accesses to this peripheral are allowed to be buffered. ¹ |
| 2 | SP | Supervisor Protect - This bit determines whether the peripheral requires supervisor privilege level for access. |
| 1 | WP | Write Protect - This bit determines whether the peripheral allows write accesses. |
| 0 | TP | Trusted Protect - This bit determines whether the peripheral allows accesses from an untrusted master. |

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.
1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.
1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

13.8.4 Off-Platform Peripheral Access Control Registers (AIPSTZx_OPACR1)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ_OPACR has the following format shown in [Table 13-9](#)

Address: Base address + 44h offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

13.8.5 Off-Platform Peripheral Access Control Registers (AIPSTZx_OPACR2)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ_OPACR has the following format shown in [Table 13-9](#)

Address: Base address + 48h offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

13.8.6 Off-Platform Peripheral Access Control Registers (AIPSTZx_OPACR3)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ_OPACR has the following format shown in [Table 13-9](#)

Address: Base address + 4Ch offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Chapter 14

AHB-to-APBH Bridge with DMA (APBH-Bridge-DMA)

14.1 Overview

The AHB-to-APBH bridge provides the i.MX 6Dual/6Quad with an inexpensive peripheral attachment bus running on the AHB's HCLK.

(The H in APBH denotes that the APBH is synchronous to HCLK.)

As shown in the figure below, the AHB-to-APBH bridge includes the AHB-to-APB PIO bridge for a memory-mapped I/O to the APB devices, as well as a central DMA facility for devices on this bus and a vectored interrupt controller for the ARM core. Each one of the APB peripherals, including the vectored interrupt controller, is documented in their respective chapters.

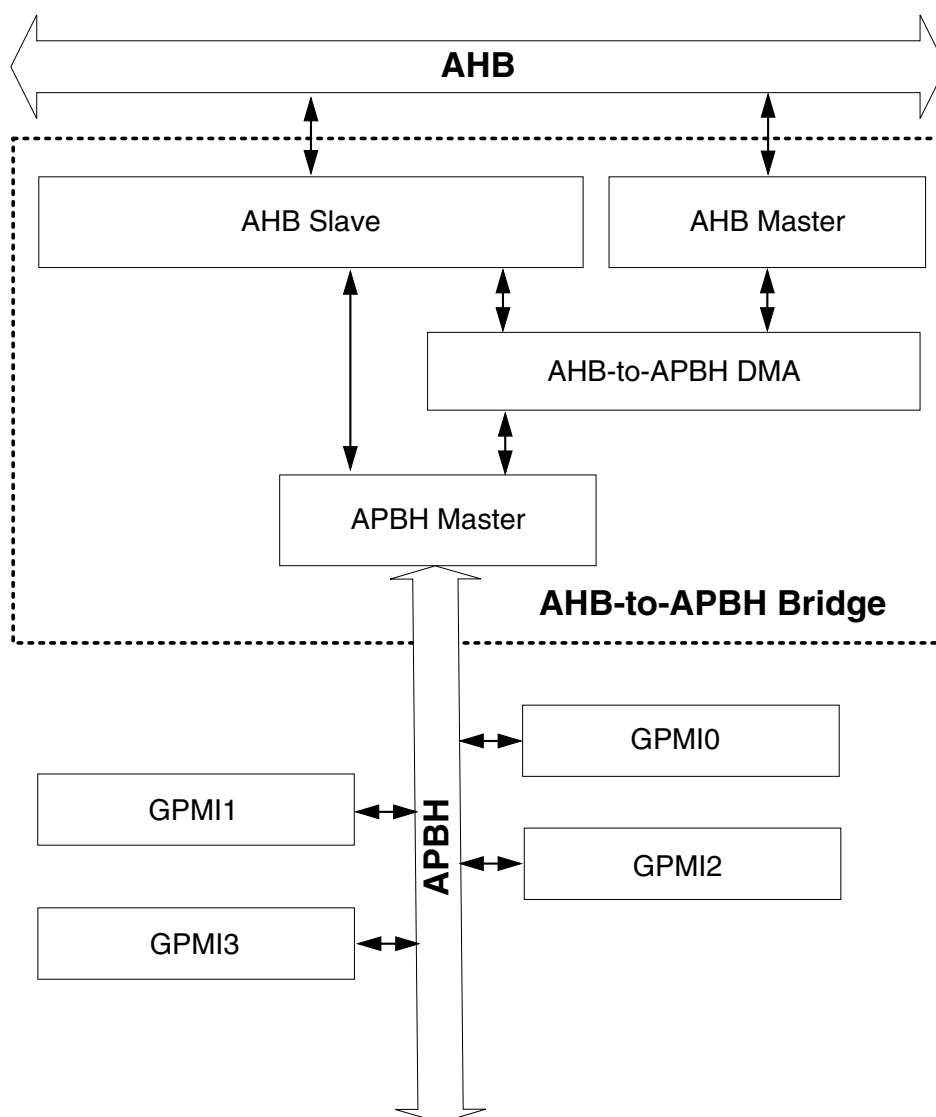

Figure 14-1. AHB-to-APBH Bridge DMA Block Diagram

There is no separate DMA bus for these devices. Contention between the DMA's use of the APBH bus and the AHB-to-APB bridge functions' use of the APBH is mediated by an internal arbitration logic. For contention between these two units, the DMA is favored and the AHB slave will report "not ready" through its HREADY output until the bridge transfer can complete. The arbiter tracks repeated lockouts and inverts the priority, guaranteeing the ARM platform every fourth transfer on the APB.

14.2 Clocks

The table found here describes the clock sources for APBH.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 14-1. APBH Clocks

| Clock name | Clock Root | Description |
|------------|-----------------|--------------|
| hclk | usdhc3_clk_root | Module clock |

14.3 APBH DMA

The DMA supports four channels of DMA services, as shown in the following table. The shared DMA resource allows each independent channel to follow a simple chained command list.

Command chains are built up using the general structure, as shown in [Figure 14-2](#).

Table 14-2. APBH DMA channel assignments

| APBH DMA Channel # | Usage |
|--------------------|-------|
| 0 | GPMI0 |
| 1 | GPMI1 |
| 2 | GPMI2 |
| 3 | GPMI3 |

A single command structure or channel command word specifies a number of operations to be performed by the DMA in support of a given device. Thus, the ARM platform can set up large units of work, chaining together many DMA channel command words, pass them off to the DMA, and have no further concern for the device until the DMA completion interrupt occurs. The goal is to have enough intelligence in the DMA and the devices to keep the interrupt frequency from any device below 1 KHz (arrival intervals longer than 1 ms).

A single command structure can issue 32-bit PIO write operations to key registers in the associated device using the same APB bus and controls that it uses to write DMA data bytes to the device. For example, this allows a chain of operations to be issued to the GPMI controller to send NAND command bytes, address bytes, and data transfers where the command and the address structure is completely under software control, but the administration of that transfer is handled autonomously by the DMA. Each DMA structure can have 0–15 PIO words appended to it. The CMDPIOWORDS field, if non-zero, instructs the DMA engine to copy these words to the APB, beginning at the first register address offset for the peripheral and incrementing the register offset each cycle.

The DMA master generates only normal read/write transfers to the APBH. It does *not* generate set, clear, or toggle (SCT) transfers.

After any requested PIO words have been transferred to the peripheral, the DMA examines the two-bit command field in the channel command structure. [Table 14-3](#) shows the four commands implemented by the DMA.

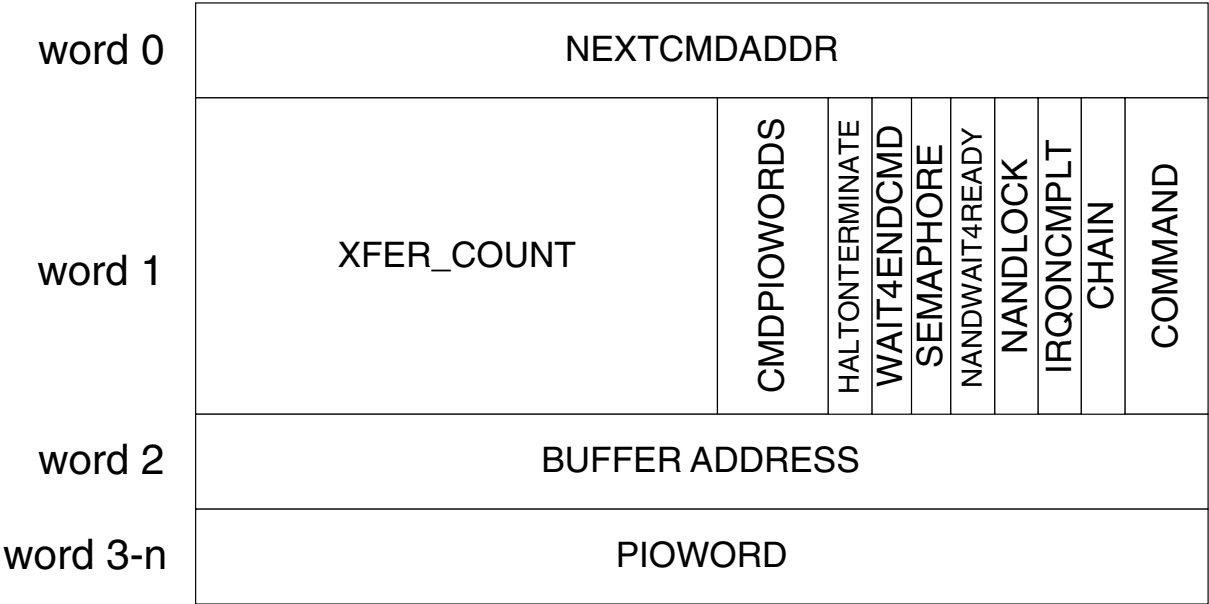

Figure 14-2. AHB-to-APBH Bridge DMA channel command structure

Table 14-3. APBH DMA commands

| DMA Command | Usage |
|-------------|--|
| 00 | NO_DMA_XFER. Perform any requested PIO word transfers, but terminate the command before any DMA transfer. |
| 01 | DMA_WRITE. Perform any requested PIO word transfers, then perform a DMA transfer from the peripheral for the specified number of bytes. |
| 10 | DMA_READ. Perform any requested PIO word transfers and then perform a DMA transfer to the peripheral for the specified number of bytes. |
| 11 | DMA_SENSE. Perform any requested PIO word transfers, then perform a conditional branch to the next chained device. Follow the NEXTCMD_ADDR pointer if the peripheral sense is false. Follow the BUFFER_ADDRESS as a chain pointer if the peripheral sense line is true. This command becomes a no-operation for any channel other than a GPMI channel. |

DMA_WRITE operations copy data bytes to the system memory (on-chip RAM or SDRAM) from the associated peripheral.

DMA_READ operations copy data bytes to the APB peripheral from the system memory. The DMA engine contains a shared byte aligner that aligns bytes from system memory to or from the peripherals. Peripherals always assume little-endian-aligned data arrives or

departs on their 32-bit APB. The DMA_READ transfer uses the BUFFER_ADDRESS word in the command structure to point to the DMA data buffer to be read by the DMA_READ command.

The NO_DMA_XFER command is used to write PIO words to a device without performing any DMA data byte transfers. This command is useful in such applications as activating the NAND devices CHECKSTATUS operation. The check status command reads a status byte from the NAND device, performs an XOR and MASK against an expected value supplied as part of the PIO transfer. Once the read check completes (see [NAND Read Status Polling Example](#)), the NO_DMA_XFER command completes. The result in the peripheral is that its sense line is driven by the results of the comparison. The sense flip-flop is only updated by CHECKSTATUS for the device that is executed. At some future point, the chain contains a DMA command structure with the fourth and final command value, that is, the DMA_SENSE command.

As each DMA command completes, it triggers the DMA to load the next DMA command structure in the chain. The normal flow list of DMA commands is found by following the NEXTCMD_ADDR pointer in the DMA command structure. The DMA_SENSE command uses the DMA buffer pointer word of the command structure to point to an alternate DMA command structure chain or list. The DMA_SENSE command examines the sense line of the associated peripheral. If the sense line is false, then the DMA follows the standard list found whose next command is found from the pointer in the NEXTCMD_ADDR word of the command structure. If the sense line is true, then the DMA follows the alternate list whose next command is found from the pointer in the DMA Buffer Pointer word of the DMA_SENSE command structure (see [Figure 14-2](#)). The sense command ignores the CHAIN bit, so that both pointers must be valid when the DMA comes to a sense command.

If the wait-for-end-command bit (WAIT4ENDCMD) is set in a command structure, the DMA channel waits for the device to signal completion of a command by toggling the endcmd signal before proceeding to load and execute the next command structure. Then, if DECREMENT_SEMAPHORE is set, the semaphore is decremented after the end command is seen.

A detailed bit-field view of the DMA command structure is shown in the following table, which shows a field that specifies the number of bytes to be transferred by this DMA command. The transfer-count mechanism is duplicated in the associated peripheral, either as an implied or as a specified count in the peripheral.

Table 14-4. DMA channel command word in system memory

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Table continues on the next page...

Table 14-4. DMA channel command word in system memory (continued)

| | | | | | | | | | | | | | |
|---|---------------------------|--|--|--|--|-------------------|---------------|---------------------|-------------------|-----------|--------------|-------|---------|
| Number DMA Bytes to Transfer | Number PIO Words to Write | | | | | HALT ON TERMINATE | WAIT 4 ENDCMD | DECREMENT SEMAPHORE | NAND WAIT 4 READY | NAND LOCK | IRQ COMPLETE | CHAIN | COMMAND |
| DMA Buffer or Alternate CCW | | | | | | | | | | | | | |
| Zero or More PIO Words to Write to the Associated Peripheral Starting at its Base Address on the APBH Bus | | | | | | | | | | | | | |

Figure 14-2 also shows the CHAIN bit in bit 2 of the second word of the command structure. This bit is set to 1, if the NEXT_COMMAND_ADDRESS contains a pointer to another DMA command structure. If a null pointer (0) is loaded into the NEXT_COMMAND_ADDRESS, it is not detected by the DMA hardware. Only the CHAIN bit indicates whether a valid list exists beyond the current structure.

If the IRQ_COMPLETE bit is set in the command structure, then the last act of the DMA before loading the next command is to set the interrupt-status bit corresponding to the current channel. The sticky interrupt request bit in the DMA CSR remains set until cleared by the software. It can be used to interrupt the ARM platform.

The NAND_LOCK bit is monitored by the DMA channel arbiter. Once a NAND channel (from channel 0 to channel 3) succeeds in the arbiter with its NAND_LOCK bit set, then the arbiter ignores the other NAND channels until a command is completed in which the NAND_LOCK is not set. Notice that the semantic here is that the NAND_LOCK state is to limit scheduling of a non-locked DMA. A DMA channel can go from unlocked to locked in the arbiter at the beginning of a command when the NAND_LOCK bit is set. When the last DMA command of an atomic sequence is completed, the lock should be removed. To accomplish this, the last command does not have the NAND_LOCK bit. It is still locked in the atomic state within the arbiter when the command starts, so that it is the only NAND command that can be executed. At the end, it drops from the atomic state within the arbiter.

The NAND_WAIT4READY bit also has a special use for GPMI channels (from channel 0 to channel 3), i.e., the NAND device channels. The GPMI peripheral supplies a sample of the ready line from the NAND device. This ready value is used to hold off of a command with this bit set until the ready line is asserted to 1. Once the arbiter sees a command with a wait-for-ready set, it holds off that channel until ready is asserted.

Receiving an IRQ for HALTONTERMINATE (HOT) is a feature in the APBH DMA descriptor that allows GPMI to signal to the DMA engine that an error has occurred. If a command is stalled due to an error, a HOT signal is sent from the peripheral to the DMA engine and causes an IRQ after terminating the DMA descriptor being executed.

Therefore, it is recommended that software use this signal as follows:

- Always set HALTONTERMINATE to 1 in a DMA descriptor. That way, if a peripheral signals HOT, the transfer will end, leaving the peripheral block and the DMA engine synchronized (but at the end of a command).
- When an IRQ from an APBH channel is received, and the IRQ is determined to be due to an error (as opposed to an IRQONCOMPLETE interrupt) the software should:
 - Reset the channel.
 - Determine the error from error reporting in the peripheral block, then manage the error in the peripheral that is attached to that channel in whatever appropriate way exists for that device (software recovery, device reset, block reset, etc).

Each channel has an eight-bit counting semaphore that controls whether it is in the idle state. When the semaphore is non-zero, the channel is ready to run, process commands and perform DMA transfers. Whenever a command finishes its DMA transfer, it checks the DECREMENT_SEMAPHORE bit. If set, it decrements the counting semaphore. If the semaphore goes to 0 as a result, then the channel enters the idle state and remains there until the semaphore is incremented by the software. When the semaphore goes to non-zero and the channel is in its idle state, then it uses the value in the APBH_CHn_NXTCMDAR register (next command address register) to fetch a pointer to the next command to process.

NOTE

This is a double indirect case. This method allows the software to append to a running command list under the protection of the counting semaphore.

To start processing the first time, software creates the command list to be processed. It writes the address of the first command into the APBH_CHn_NXTCMDAR register, and then writes 1 to the counting semaphore in APBH_CHn_SEMA. The DMA channel loads APBH_CHn_CURCMDAR register and then enters the normal state machine processing for the next command. When the software writes a value to the counting semaphore, it is added to the semaphore count by hardware, protecting the case where both hardware and software are trying to change the semaphore on the same clock edge.

Software can examine the value of APBH_CHn_CURCMDAR at any time to determine the location of the command structure currently being processed.

14.4 NAND Read Status Polling Example

The following figure shows a more complicated scenario.

This subset of a NAND device workload shows that the first two command structures are used during the data-write phase of an NAND device write operation (CLE and ALE transfers omitted for clarity).

- After writing the data, one must wait until the NAND device status register indicates that the write charge has been transferred. This is built into the workload using a check status command in the NAND in a loop created from the next two DMA command structures.
- The NO_DMA_TRANSFER command is shown here performing the read check, followed by a DMA_SENSE command to branch the DMA command structure list, based on the status of a bit in the external NAND device.

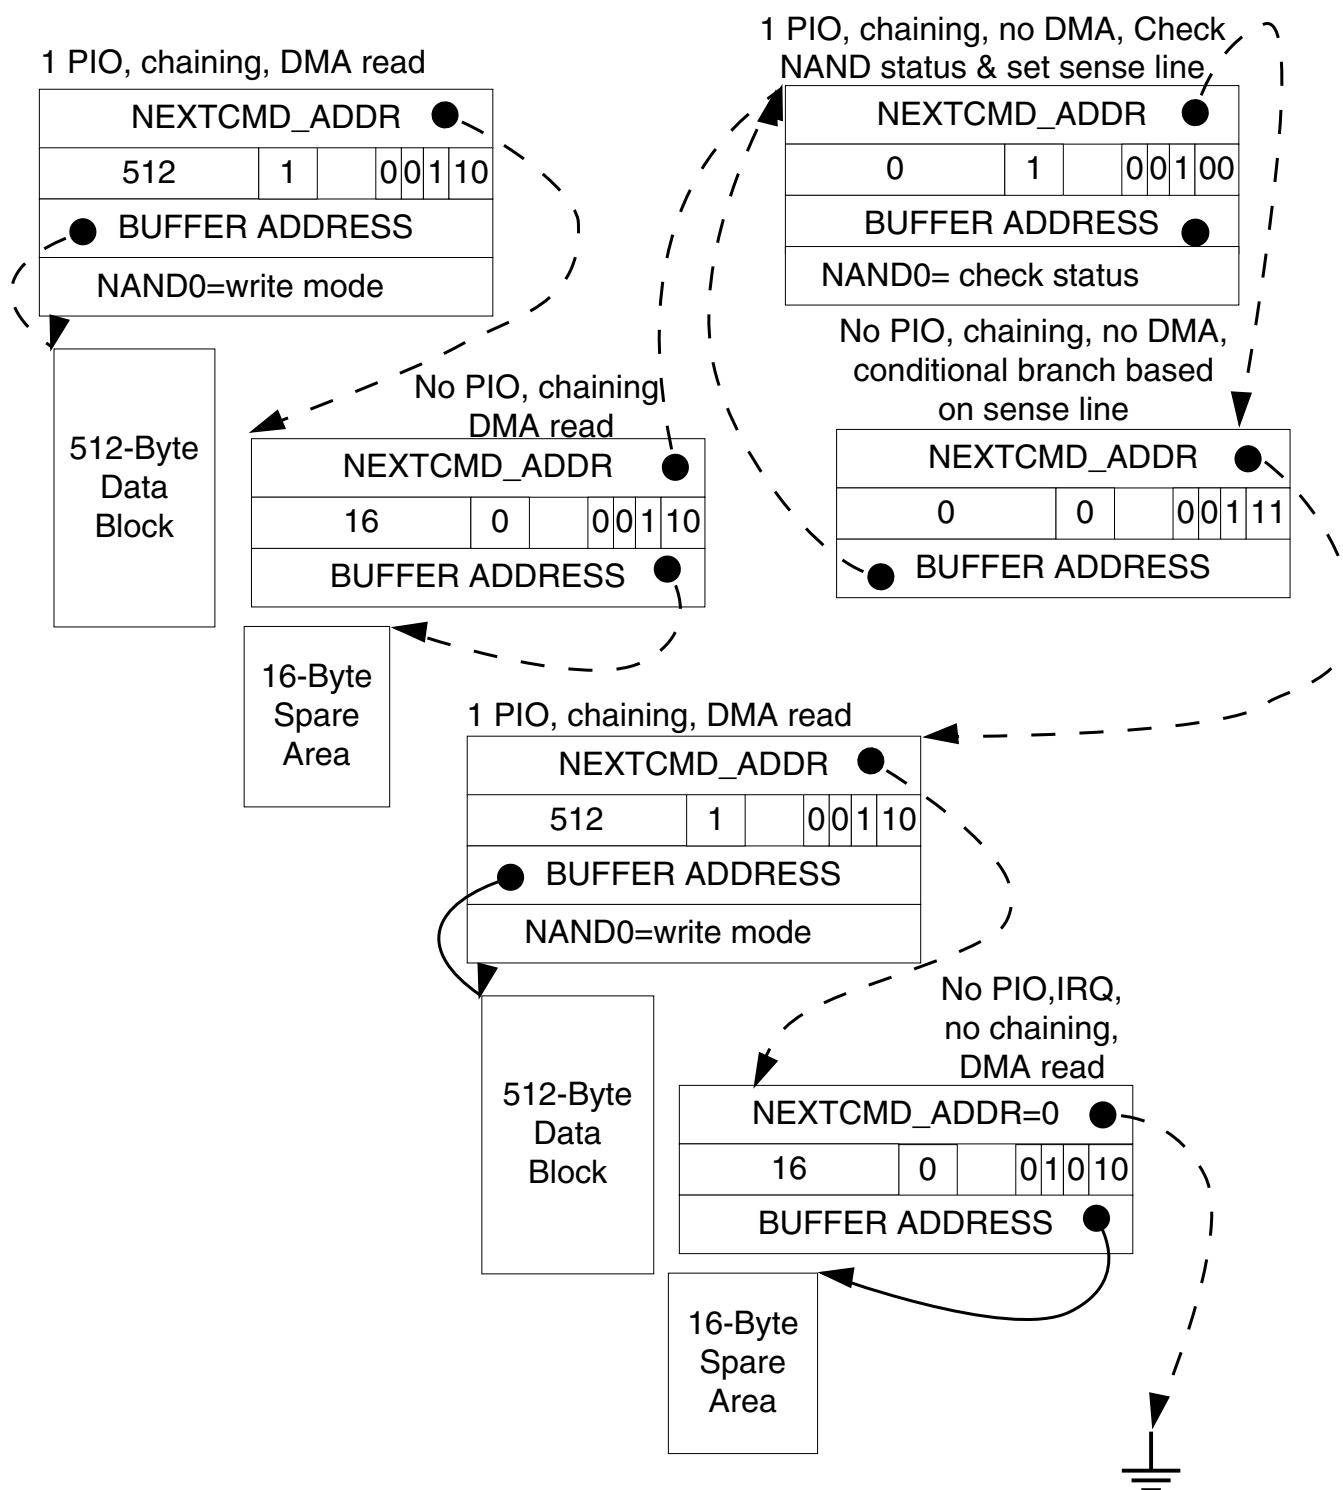

Figure 14-3. AHB-to-APBH Bridge DMA NAND Read Status Polling with DMA Sense Command

The example in the above figure shows the workload continuing immediately to the next NAND page transfer. However, one could perform a second sense operation to see if an error has occurred after the write. One could then point the sense command alternate branch at a NO_DMA_XFER command with the interrupt bit set. If the CHAIN bit is not

set on this failure branch, then the ARM platform is interrupted immediately, and the channel process is also immediately terminated in the presence of a workload-detected NAND error bit.

Note that each word of the three-word DMA command structure corresponds to a PIO register of the DMA that is accessible on the APBH bus. Normally, the DMA copies the next command structure onto these registers for processing at the start of each command by following the value of the pointer previously loaded into the NEXTCMD_ADDR register.

To start DMA processing for the first command, initialize the PIO registers of the desired channel, as follows:

- First, load the next command address register with a pointer to the first command to be loaded.
- Then, write 1 to the counting semaphore register. This causes the DMA to schedule the targeted channel for the DMA command structure load, just as if it had finished its previous command.

14.5 APBH Memory Map/Register Definition

APBH Hardware Register Format Summary

APBH memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/page |
|------------------------|---|-----------------|--------|-------------|----------------------------|
| 11_0000 | AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0) | 32 | R/W | E000_0000h | 14.5.1/616 |
| 11_0004 | AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0_SET) | 32 | R/W | E000_0000h | 14.5.1/616 |
| 11_0008 | AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0_CLR) | 32 | R/W | E000_0000h | 14.5.1/616 |
| 11_000C | AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0_TOG) | 32 | R/W | E000_0000h | 14.5.1/616 |
| 11_0010 | AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1) | 32 | R/W | 0000_0000h | 14.5.2/618 |
| 11_0014 | AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1_SET) | 32 | R/W | 0000_0000h | 14.5.2/618 |
| 11_0018 | AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1_CLR) | 32 | R/W | 0000_0000h | 14.5.2/618 |

14.5.1 AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0n)

The APBH CTRL 0 provides overall control of the AHB to APBH bridge and DMA.

This register contains module softreset, clock gating, channel clock gating/freeze bits.

Address: 11_0000h base + 0h offset + (4d × i), where i=0d to 3d

| | | | | | | | | | | | | | | | | |

APBH_CTRL0n field descriptions

| Field | Description |
|-------------------------|--|
| 31 SFTRST | Set this bit to zero to enable normal APBH DMA operation. Set this bit to one (default) to disable clocking with the APBH DMA and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the APBH DMA block to its default state. |
| 30 CLKGATE | This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block. |
| 29 AHB_BURST8_EN | Set this bit to one (default) to enable AHB 8-beat burst. Set to zero to disable 8-beat burst on AHB interface. |
| 28 APB_BURST_EN | Set this bit to one to enable apb master do a continous transfers when a device request a burst dma. Set to zero will treat a burst dma request as 4/8 individual requests. |
| 27–16 RSVD0 | This field is reserved. Reserved, always set to zero. |
| 15–0 CLKGATE_CHANNEL | These bits must be set to zero for normal operation of each channel. When set to one they gate off the individual clocks to the channels. 0x0001 NAND0 — 0x0002 NAND1 — 0x0004 NAND2 — 0x0008 NAND3 — 0x0010 NAND4 — 0x0020 NAND5 — 0x0040 NAND6 — 0x0080 NAND7 — 0x0100 SSP — |

14.5.2 AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1n)

The APBH CTRL one provides overall control of the interrupts generated by the AHB to APBH DMA. This register contains the per channel interrupt status bits and the per channel interrupt enable bits. Each channel has a dedicated interrupt vector in the vectored interrupt controller.

EXAMPLE

```
BF_WR(APBH_CTRL1, CH5_CMDCMPLT_IRQ, 0); // use bitfield write macro
BF_APBH_CTRL1.CH5_CMDCMPLT_IRQ = 0;    // or, assign to register
struct's bitfield
```

Address: 11_0000h base + 10h offset + (4d × i), where i=0d to 3d

| 3 CH3_ CMDCMPLT_ IRQ | Interrupt request status bit for APBH DMA channel 3. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt. |
| 2 CH2_ CMDCMPLT_ IRQ | Interrupt request status bit for APBH DMA channel 2. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt. |
| 1 CH1_ CMDCMPLT_ IRQ | Interrupt request status bit for APBH DMA channel 1. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt. |
| 0 CH0_ CMDCMPLT_ IRQ | Interrupt request status bit for APBH DMA channel 0. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt. |

14.5.3 AHB to APBH Bridge Control and Status Register 2 (APBH_CTRL2 n)

The APBH CTRL 2 provides channel error interrupts generated by the AHB to APBH DMA. This register contains the per channel interrupt status bits and the per channel interrupt enable bits. Each channel has a dedicated interrupt vector in the vectored interrupt controller.

EXAMPLE

```

BF_WR(APBH_CTRL1, CH5_CMDCMPLT_IRQ, 0); // use bitfield write macro
BF_APBH_CTRL1.CH5_CMDCMPLT_IRQ = 0;    // or, assign to register
struct's bitfield

```

14.5.5 AHB to APBH DMA Device Assignment Register (APBH_DEVSEL)

This register allows reassignment of the APBH device connected to the DMA Channels.

In this chip, APBH DMA channel resource is enough for high speed peripherals, so this register is of no use and reserved.

Address: 11_0000h base + 40h offset = 11_0040h

APBH Memory Map/Register Definition

APBH_DEBUG field descriptions

| Field | Description |
|--------------------|--|
| 31–1 - | This field is reserved. Reserved, always set to zero. |
| 0 GPMI_ONE_FIFO | Set to One and the 8 GPMI channels will share the DMA FIFO, and when set to zero, the 8 GPMI channels will use its own DMA FIFO. |

14.5.8 APBH DMA Channel n Current Command Address Register (APBH_CHn_CURCMDAR)

The APBH DMA channel n current command address register points to the multiword command that is currently being executed. Commands are threaded on the command address.

APBH DMA Channel n is controlled by a variable sized command structure. This register points to the command structure currently being executed.

EXAMPLE

```
pCurCmd = (apbh_chn_cmd_t *) APBH_CHn_CURCMDAR_RD(0);           // read the whole
register, since there is only one field
pCurCmd = (apbh_chn_cmd_t *) BF_RDn(APBH_CHn_CURCMDAR, 0, CMD_ADDR); // or, use multi-
register bitfield read macro
pCurCmd = (apbh_chn_cmd_t *) APBH_CHn_CURCMDAR(0).CMD_ADDR;      // or, assign from
bitfield of indexed register's struct
```

Address: 11_0000h base + 100h offset + (112d × i), where i=0d to 15d

APBH_CHn_CURCMDAR field descriptions

| Field | Description |
|------------------|---|
| 31–0 CMD_ADDR | Pointer to command structure currently being processed for channel n. |

14.5.9 APBH DMA Channel n Next Command Address Register (APBH_CHn_NXTCMDAR)

The APBH DMA Channel n Next Command Address register contains the address of the next multiword command to be executed. Commands are threaded on the command address. Set CHAIN to 1 in the DMA command word to process command lists.

APBH DMA Channel n is controlled by a variable sized command structure. Software loads this register with the address of the first command structure to process and increments the Channel n semaphore to start processing. This register points to the next command structure to be executed when the current command is completed.

EXAMPLE

```
APBH_CHn_NXTCMDAR_WR(0, (reg32_t) pCommandTwoStructure);           // write the entire
register, since there is only one field
BF_WRN(APBH_CHn_NXTCMDAR, 0, (reg32_t) pCommandTwoStructure);      // or, use multi-
register bitfield write macro
APBH_CHn_NXTCMDAR(0).CMD_ADDR = (reg32_t) pCommandTwoStructure;    // or, assign to bitfield
of indexed register's struct
```

Address: 11_0000h base + 110h offset + (112d × i), where i=0d to 15d

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

APBH_CHn_NXTCMDAR field descriptions

| Field | Description |
|------------------|--|
| 31–0 CMD_ADDR | Pointer to next command structure for channel n. |

14.5.10 APBH DMA Channel n Command Register (APBH_CHn_CMD)

The APBH DMA Channel n command register specifies the DMA transaction to perform for the current command chain item.

The command register controls the overall operation of each DMA command for this channel. It includes the number of bytes to transfer to or from the device, the number of APB PIO command words included with this command structure, whether to interrupt at command completion, whether to chain an additional command to the end of this one and whether this transfer is a read or write DMA transfer.

EXAMPLE

```
apbh_chn_cmd_t dma_cmd;
dma_cmd.XFER_COUNT = 512; // transfer 512 bytes
dma_cmd.COMMAND = BV_APBH_CHn_CMD_COMMAND__DMA_WRITE; // transfer to system memory from
peripheral device
dma_cmd.CHAIN = 1; // chain an additional command
structure on to the list
dma_cmd.IRQONCMPLT = 1; // generate an interrupt on
completion of this command structure
```

Address: 11_0000h base + 120h offset + (112d × i), where i=0d to 15d

APBH_CHn_CMD field descriptions

| Field | Description |
|----------------------|---|
| 31–16 XFER_COUNT | This field indicates the number of bytes to transfer to or from the appropriate PIO register in the GPMIO device. A value of 0 indicates a 64 KBytes transfer. |
| 15–12 CMDWORDS | This field indicates the number of command words to send to the GPMIO, starting with the base PIO address of the GPMIO control register and incrementing from there. Zero means transfer NO command words |
| 11–9 - | This field is reserved. Reserved, always set to zero. |
| 8 HALTONTERMINATE | A value of one indicates that the channel will immediately terminate the current descriptor and halt the DMA channel if a terminate signal is set. A value of 0 will still cause an immediate terminate of the channel if the terminate signal is set, but the channel will continue as if the count had been exhausted, meaning it will honor IRQONCMPLT, CHAIN, SEMAPHORE, and WAIT4ENDCMD. |
| 7 WAIT4ENDCMD | A value of one indicates that the channel will wait for the end of command signal to be sent from the APBH device to the DMA before starting the next DMA command. |
| 6 SEMAPHORE | A value of one indicates that the channel will decrement its semaphore at the completion of the current command structure. If the semaphore decrements to zero, then this channel stalls until software increments it again. |
| 5 NANDWAIT4READY | A value of one indicates that the NAND DMA channel will wait until the NAND device reports "ready" before executing the command. It is ignored for non-NAND DMA channels. |
| 4 NANDLOCK | A value of one indicates that the NAND DMA channel will remain "locked" in the arbiter at the expense of other NAND DMA channels. It is ignored for non-NAND DMA channels. |
| 3 IRQONCMPLT | A value of one indicates that the channel will cause the interrupt status bit to be set upon completion of the current command, i.e. after the DMA transfer is complete. |

Table continues on the next page...

APBH_CHn_CMD field descriptions (continued)

| Field | Description |
|----------------|--|
| 2 CHAIN | A value of one indicates that another command is chained onto the end of the current command structure. At the completion of the current command, this channel will follow the pointer in APBH_CHn_CMDAR to find the next command. |
| 1–0 COMMAND | This bitfield indicates the type of current command: 0x0 NO_DMA_XFER — Perform any requested PIO word transfers but terminate command before any DMA transfer. 0x1 DMA_WRITE — Perform any requested PIO word transfers and then perform a DMA transfer from the peripheral for the specified number of bytes. 0x2 DMA_READ — Perform any requested PIO word transfers and then perform a DMA transfer to the peripheral for the specified number of bytes. 0x3 DMA_SENSE — Perform any requested PIO word transfers and then perform a conditional branch to the next chained device. Follow the NEXCMD_ADDR pointer if the peripheral sense is true. Follow the BUFFER_ADDRESS as a chain pointer if the peripheral sense line is false. |

14.5.11 APBH DMA Channel n Buffer Address Register (APBH_CHn_BAR)

The APBH DMA Channel n buffer address register contains a pointer to the data buffer for the transfer. For immediate forms, the data is taken from this register. This is a byte address which means transfers can start on any byte boundary.

This register holds a pointer to the data buffer in system memory. After the command values have been read into the DMA controller and the device controlled by this channel, then the DMA transfer will begin, to or from the buffer pointed to by this register.

EXAMPLE

```
apbh_chn_bar_t dma_data;
dma_data.ADDRESS = (reg32_t) pDataBuffer;
```

Address: 11_0000h base + 130h offset + (112d × i), where i=0d to 15d

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | ADDRESS | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

APBH_CHn_BAR field descriptions

| Field | Description |
|-----------------|---|
| 31–0 ADDRESS | Address of system memory buffer to be read or written over the AHB bus. |

14.5.12 APBH DMA Channel n Semaphore Register (APBH_CHn_SEMA)

The APBH DMA Channel n semaphore register is used to synchronize the ARM platform instruction stream and the DMA chain processing state.

Each DMA channel has an 8 bit counting semaphore that is used to synchronize between the program stream and the DMA chain processing. DMA processing continues until the DMA attempts to decrement a semaphore that has already reached a value of zero. When the attempt is made, the DMA channel is stalled until software increments the semaphore count.

EXAMPLE

```
BF_WR(APBH_CHn_SEMA, 0, INCREMENT_SEMA, 2);    // increment semaphore by two
current_sema = BF_RD(APBH_CHn_SEMA, 0, PHORE);  // get instantaneous value
```

Address: 11_0000h base + 140h offset + (112d × i), where i=0d to 15d

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----------|----|----|----|----|----|---|---|----------------|---|---|---|---|---|---|---|
| R | Reserved | | | | | | | | PHORE | | | | | | | | Reserved | | | | | | | | INCREMENT_SEMA | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

APBH_CHn_SEMA field descriptions

| Field | Description |
|-----------------------|--|
| 31–24 - | This field is reserved. Reserved, always set to zero. |
| 23–16 PHORE | This read-only field shows the current (instantaneous) value of the semaphore counter. |
| 15–8 - | This field is reserved. Reserved, always set to zero. |
| 7–0 INCREMENT_SEMA | The value written to this field is added to the semaphore count in an atomic way such that simultaneous software adds and DMA hardware subtracts happening on the same clock are protected. This bit field reads back a value of 0x00. Writing a value of 0x02 increments the semaphore count by two, unless the DMA channel decrements the count on the same clock, then the count is incremented by a net one. |

14.5.13 AHB to APBH DMA Channel n Debug Information (APBH_CHn_DEBUG1)

This register gives debug visibility into the APBH DMA Channel n state machine and controls.

APBH Memory Map/Register Definition

This register allows debug visibility of the APBH DMA Channel n.

Address: 11_0000h base + 150h offset + (112d × i), where i=0d to 15d

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

APBH_CHn_DEBUG1 field descriptions

| Field | Description |
|------------------------|---|
| 31 REQ | This bit reflects the current state of the DMA Request Signal from the APB device |
| 30 BURST | This bit reflects the current state of the DMA Burst Signal from the APB device |
| 29 KICK | This bit reflects the current state of the DMA Kick Signal sent to the APB Device |
| 28 END | This bit reflects the current state of the DMA End Command Signal sent from the APB Device |
| 27 SENSE | This field is reserved. This bit is reserved for this DMA Channel and always reads 0. |
| 26 READY | This bit is reserved for this DMA Channel and always reads 0. |
| 25 LOCK | This field is reserved. This bit is reserved for this Channel and always reads 0. |
| 24 NEXTCMDADDRVALID | This bit reflects the internal bit which indicates whether the channel's next command address is valid. |
| 23 RD_FIFO_EMPTY | This bit reflects the current state of the DMA Channel's Read FIFO Empty signal. |
| 22 RD_FIFO_FULL | This bit reflects the current state of the DMA Channel's Read FIFO Full signal. |
| 21 WR_FIFO_EMPTY | This bit reflects the current state of the DMA Channel's Write FIFO Empty signal. |
| 20 WR_FIFO_FULL | This bit reflects the current state of the DMA Channel's Write FIFO Full signal. |
| 19–5 RSVD1 | This field is reserved. Reserved |
| 4–0 STATEMACHINE | <p>PIO Display of the DMA Channel n state machine state.</p> <p>0x00 IDLE — This is the idle state of the DMA state machine.</p> <p>0x01 REQ_CMD1 — State in which the DMA is waiting to receive the first word of a command.</p> <p>0x02 REQ_CMD3 — State in which the DMA is waiting to receive the third word of a command.</p> <p>0x03 REQ_CMD2 — State in which the DMA is waiting to receive the second word of a command.</p> <p>0x04 XFER_DECODE — The state machine processes the descriptor command field in this state and branches accordingly.</p> <p>0x05 REQ_WAIT — The state machine waits in this state for the PIO APB cycles to complete.</p> <p>0x06 REQ_CMD4 — State in which the DMA is waiting to receive the fourth word of a command, or waiting to receive the PIO words when PIO count is greater than 1.</p> <p>0x07 PIO_REQ — This state determines whether another PIO cycle needs to occur before starting DMA transfers.</p> <p>0x08 READ_FLUSH — During a read transfers, the state machine enters this state waiting for the last bytes to be pushed out on the APB.</p> <p>0x09 READ_WAIT — When an AHB read request occurs, the state machine waits in this state for the AHB transfer to complete.</p> <p>0x0C WRITE — During DMA Write transfers, the state machine waits in this state until the AHB master arbiter accepts the request from this channel.</p> <p>0x0D READ_REQ — During DMA Read transfers, the state machine waits in this state until the AHB master arbiter accepts the request from this channel.</p> |

Table continues on the next page...

APBH_CHn_DEBUG1 field descriptions (continued)

| Field | Description |
|-------|---|
| 0x0E | CHECK_CHAIN — Upon completion of the DMA transfers, this state checks the value of the Chain bit and branches accordingly. |
| 0x0F | XFER_COMPLETE — The state machine goes to this state after the DMA transfers are complete, and determines what step to take next. |
| 0x14 | TERMINATE — When a terminate signal is set, the state machine enters this state until the current AHB transfer is completed. |
| 0x15 | WAIT_END — When the Wait for Command End bit is set, the state machine enters this state until the DMA device indicates that the command is complete. |
| 0x1C | WRITE_WAIT — During DMA Write transfers, the state machine waits in this state until the AHB master completes the write to the AHB memory space. |
| 0x1D | HALT_AFTER_TERM — If HALTONTERMINATE is set and a terminate signal is set, the state machine enters this state and effectively halts. A channel reset is required to exit this state |
| 0x1E | CHECK_WAIT — If the Chain bit is a 0, the state machine enters this state and effectively halts. |
| 0x1F | WAIT_READY — When the NAND Wait for Ready bit is set, the state machine enters this state until the GPMI device indicates that the external device is ready. |

14.5.14 AHB to APBH DMA Channel n Debug Information (APBH_CHn_DEBUG2)

This register gives debug visibility for the APB and AHB byte counts for DMA Channel n.

This register allows debug visibility of the APBH DMA Channel n.

Address: 11_0000h base + 160h offset + (112d × i), where i=0d to 15d

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | APB_BYTES | | | | | | | | | | | | | | | | AHB_BYTES | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

APBH_CHn_DEBUG2 field descriptions

| Field | Description |
|--------------------|---|
| 31–16 APB_BYTES | This value reflects the current number of APB bytes remaining to be transfered in the current transfer. |
| 15–0 AHB_BYTES | This value reflects the current number of AHB bytes remaining to be transfered in the current transfer. |

14.5.15 APBH Bridge Version Register (APBH_VERSION)

This register always returns a known read value for debug purposes it indicates the version of the block.

This register indicates the RTL version in use.

EXAMPLE

```
if (APBH_VERSION.B.MAJOR != 3)
    Error();
```

Address: 11_0000h base + 800h offset = 11_0800h

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| R | MAJOR | | | | | | | | MINOR | | | | | | | | STEP | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

APBH_VERSION field descriptions

| Field | Description |
|----------------|--|
| 31–24 MAJOR | Fixed read-only value reflecting the MAJOR field of the RTL version. |
| 23–16 MINOR | Fixed read-only value reflecting the MINOR field of the RTL version. |
| 15–0 STEP | Fixed read-only value reflecting the stepping of the RTL version. |

Chapter 15

Asynchronous Sample Rate Converter (ASRC)

15.1 Overview

The Asynchronous Sample Rate Converter (ASRC) converts the sampling rate of a signal associated with an input clock into a signal associated with a different output clock.

The ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The ASRC supports up to three sampling rate pairs.

The incoming audio data to this chip may be received from various sources at different sampling rates. The outgoing audio data of this chip may have different sampling rates and it can also be associated with output clocks that are asynchronous to the input clocks.

The ASRC is implemented as a co-processor in hardware, with minimal ARM Platform intervention required.

[Figure 15-1](#) is a system view of the connection between the ASRC block and other blocks.

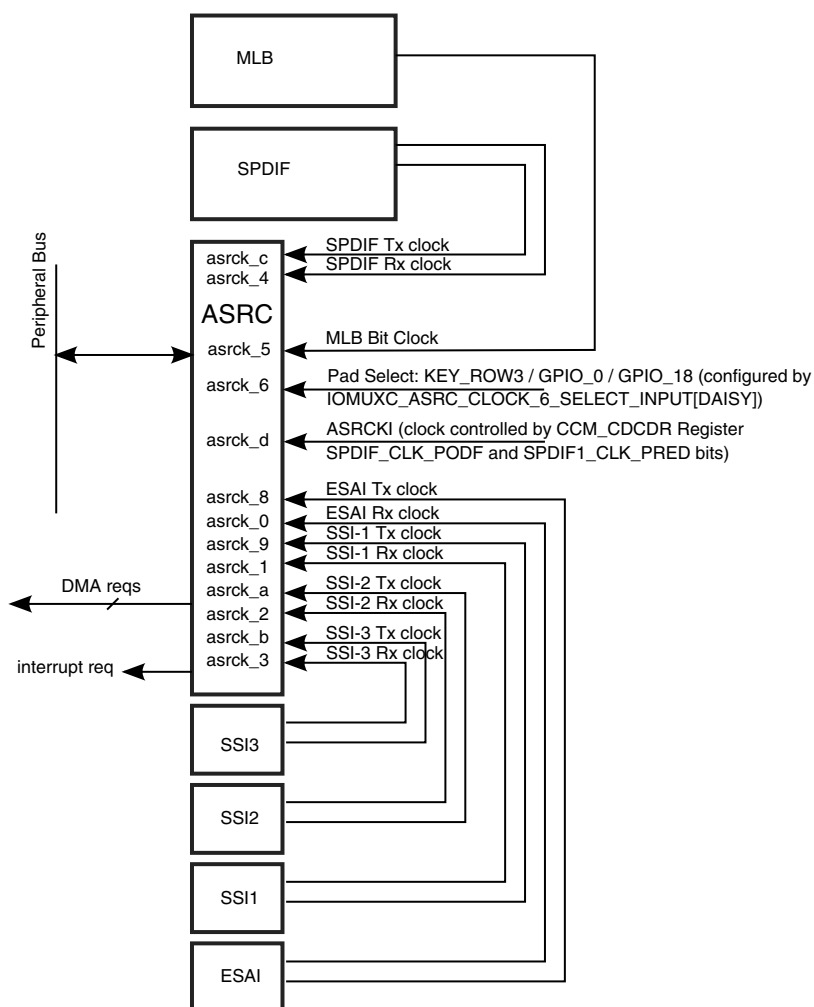

Figure 15-1. General System Overview

Figure 15-2 is the ASRC block diagram.

The red dotted line designates the ASRC block. Objects outside the dotted line represent SoC-level resources.

Figure 15-2. ASRC block diagram

15.1.1 Features

Table 15-1. ASRC Specifications

| Parameters | Test Conditions | Minimum | Typical | Maximum | Unit |
|--------------------------|---|----------------|---------|---------|------|
| Channels Supported | | 0 ¹ | | 10 | |
| Pairs of Rate Conversion | | 1 | - | 3 | |
| THD+N | 120MHz < F _{SASRC} ² <160MHz | | -120 | | dB |
| Dynamic Range | | | | 144 | dB |
| Settling Time | | | 40 | | ms |
| Comment: | | | | | |

1. When a pair has zero channels, the pair will be disabled, although the pair enable bit may be set in ASRCTR register.

2. F_{SASRC} is the processing clock of ASRC block.

Other Features:

- Any number (0-10) of contiguous channels can be associated to one of the sampling rate pairs.
- Support user-programmable threshold for the input/output FIFOs.
- Support flexible 8/16/24 bit width of input data, and 16/24 bit width of output data.
- Designed for rate conversion between 44.1kHz, 32kHz, 48kHz, 96kHz, and 192kHz. The useful signal bandwidth is below 24kHz.
- Other input sampling rates in the range of 8kHz to 200kHz is also supported, but possibly with less desirable bandwidth.
- Other output sampling rates in the range of 30kHz to 200kHz is also supported, but possibly with less desirable bandwidth.
- Limited support for the case when output sampling rates is between 8kHz and 30kHz. The limitation is the supported ratio (F_{sin}/F_{sout}) range as between 1/24 to 8
- Automatic accommodation to slow variations in the incoming and outgoing sampling rates.
- Linear phase
- Tolerant to sample clock jitter
- Designed for real-time streaming audio usage. The output sampling clock must be always physically available in the system.

Clock/Data Connections

- The sampling rate clocks are directly connected to the ASRC block, the ratio estimation of the input clocks with output clocks are done in ASRC hardware.
- The clock signals come from the following blocks, for example:
 - ESAI, receiving bit clock and transmitting bit clock
 - SPDIF, receiving bit clock and transmitting bit clock
 - other audio peripherals etc.
- The exchange of audio data is done by the processor accessing ASRC block through registers defined on shared peripheral bus.

15.1.2 Modes of Operation

See [ASRC Memory Map/Register Definition](#) for a definition of the registers and parameters used in ASRC.

15.1.2.1 Data Transfer Schemes

15.1.2.1.1 Data Input Modes

The input mode for each of the three channel sets may be set independently. Three modes of supplying data to the ASRC input FIFOs are available:

- Polling
- Interrupt
- DMA

In all input-data transfer schemes, the ASRC fetches data from each enabled FIFO and processes the data sample-by-sample after each rising edge of the associated input sampling clock until the FIFO level reaches a threshold.

After the threshold is reached, the ASRC requests data. The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers ASRMCRx, x=A, B or C.

If the ASRC attempts to fetch data from an empty FIFO, an error is generated and the ASRSTR_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER_AOLIE bit is set), an interrupt is generated.

When writing data to an input FIFO, you must ensure that it is in a predefined sequence. For example, when writing to an input FIFO, the sequence should be: channel_0, channel_1, channel_2,..., channel_n, channel_0, channel_1, channel_2, etc. Here channel_n stands for the data intended for the n-th channel. The hardware will re-allocate each data to its corresponding channel FIFO. The channel being re-allocated is shown by ASRCCR_ACIX, x=A,B or C.

Mode 1 (Polling Mode)

Polling mode is the default mode following power-on or individual reset, and is selected by clearing the associated channel set A, B, or C data-input interrupt enable bit (ASRIER_ADIE_x, where x=A, B or C). In this mode, data-input interrupts are disabled. When the FIFO level is below the threshold, the associated status bit (ASRSTR_AIDIE_x, where x=A, B, or C) is set. To clear the status bit, the FIFO must be written with enough data to raise the level above the threshold.

Mode 2 (Interrupt Mode)

The ASRC input FIFOs can also be serviced by interrupts. To enable interrupts, the corresponding data-input interrupt enable bits (ASRIER_ADIE_x, where x=A, B, or C) should be set. An interrupt is automatically generated any time the input FIFO level is below the threshold. The interrupt is cleared when enough data is written to the FIFO to raise the level above the threshold.

Mode 3 (DMA Mode)

The ASRC input FIFOs can also be filled using DMA. In this mode, the data-input interrupt-enable bits (ASRIER_ADIE_x, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

15.1.2.1.2 Data Output Modes

The output mode for each of the 3 channel sets (A, B, and C) may be set independently.

Three modes of retrieving data from the ASRC output FIFOs are available:

- Polling
- Interrupt
- DMA

In all output-data transfer schemes, the ASRC places a processed sample into the associated output FIFO. After a threshold is reached, the ASRC requests that data be transferred out of the FIFO.

The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers ASRMCR_x, x=A, B or C.

If the ASRC attempts to place data into a FIFO that is already full, an error is generated and the ASRSTR_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER_AOLIE bit is set), an interrupt is generated.

Each output FIFO is organized in the same channel order in which the associated input FIFO was written.

Three transfer modes are supported by Interface Block.

Mode 1 (Polling Mode)

The ASRC output FIFOs can be serviced by polling. In this mode, ensure the associated output-data interrupt enable bit (ASRIER_ADOE_x, where x=A, B, or C) is cleared. In this mode, all output-data interrupts are disabled. Any time the output FIFO exceeds the threshold the associated status bit (ASRSTR_AODF_x, where x=A, B, or C) is set. To clear the status bit, enough data must be read from the associated output FIFO to lower the level below the threshold.

Mode 2 (Interrupt Mode)

The ASRC output FIFOs may also be serviced using interrupts. To enable this mode, the corresponding output-data interrupt-enable bits (ASRIER_ADOE_x, where x=A, B, or C) should be set. Any time the output FIFO level exceeds the threshold, an interrupt is automatically generated. The interrupt is cleared when enough data is read from the FIFO to lower the level below the threshold.

Mode 3 (DMA Mode)

The ASRC output FIFOs can also be read using DMA. In this mode, the output-data interrupt-enable bits (ASRIER_ADOEx, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

15.1.2.2 Word Alignment Supported

15.1.2.2.1 Input Data Alignment Modes

The position and length of input data word to the input data FIFOs ASRDIA, ASRDIB, ASRDIC are programmable. The control bits are defined in ASRMCR1x {x=A, B, or C}. It supports the following modes.

Table 15-2. Input Data Alignment

| Format | Bit Number | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| 8-bit LSB Aligned | | | | | | | | | | | | | | | | | | | | | | | | | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 8-bit MSB Aligned | | | | | | | | | | | | | | | | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | | | | |
| 16-bit LSB Aligned | | | | | | | | | | | | | | | | | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

15.2 Clocks

The table found here describes the clock sources for ASRC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 15-4. ASRC Clocks

| Clock name | Clock Root | Description |
|--------------|-----------------|---------------------------------|
| asrc_clock_d | spdif1_clk_root | ASRC module clock (SPDIF clock) |
| ipg_clk | ahb_clk_root | Peripheral clock |
| mem_clk | ahb_clk_root | Peripheral access clock |

15.3 Interrupts

ASRC has several interrupts events.

The priorities are shown as [Table 15-5](#).

Table 15-5. Interrupt Priorities/Vector

| Priority | Description |
|----------|-------------------------------|
| lowest | ASRC Pair A input data needed |

Table continues on the next page...

Table 15-5. Interrupt Priorities/Vector (continued)

| Priority | Description |
|----------|-------------------------------|
| | ASRC Pair B input data needed |
| | ASRC Pair C input data needed |
| | ASRC Pair A output data ready |
| | ASRC Pair B output data ready |
| | ASRC Pair C output data ready |
| | ASRC Overload |

15.4 DMA requests

ASRC has six DMA requests. They are directly connected to the lowest six status bits in the ASRSTR register.

Table 15-6. DMA requests

| Type | Description |
|------|-------------------------------|
| 0 | ASRC Pair A input data needed |
| 1 | ASRC Pair B input data needed |
| 2 | ASRC Pair C input data needed |
| 3 | ASRC Pair A output data ready |
| 4 | ASRC Pair B output data ready |
| 5 | ASRC Pair C output data ready |

15.5 Functional Description

This section provides a complete functional description of the block.

15.5.1 Algorithm Description

15.5.1.1 Signal processing flow

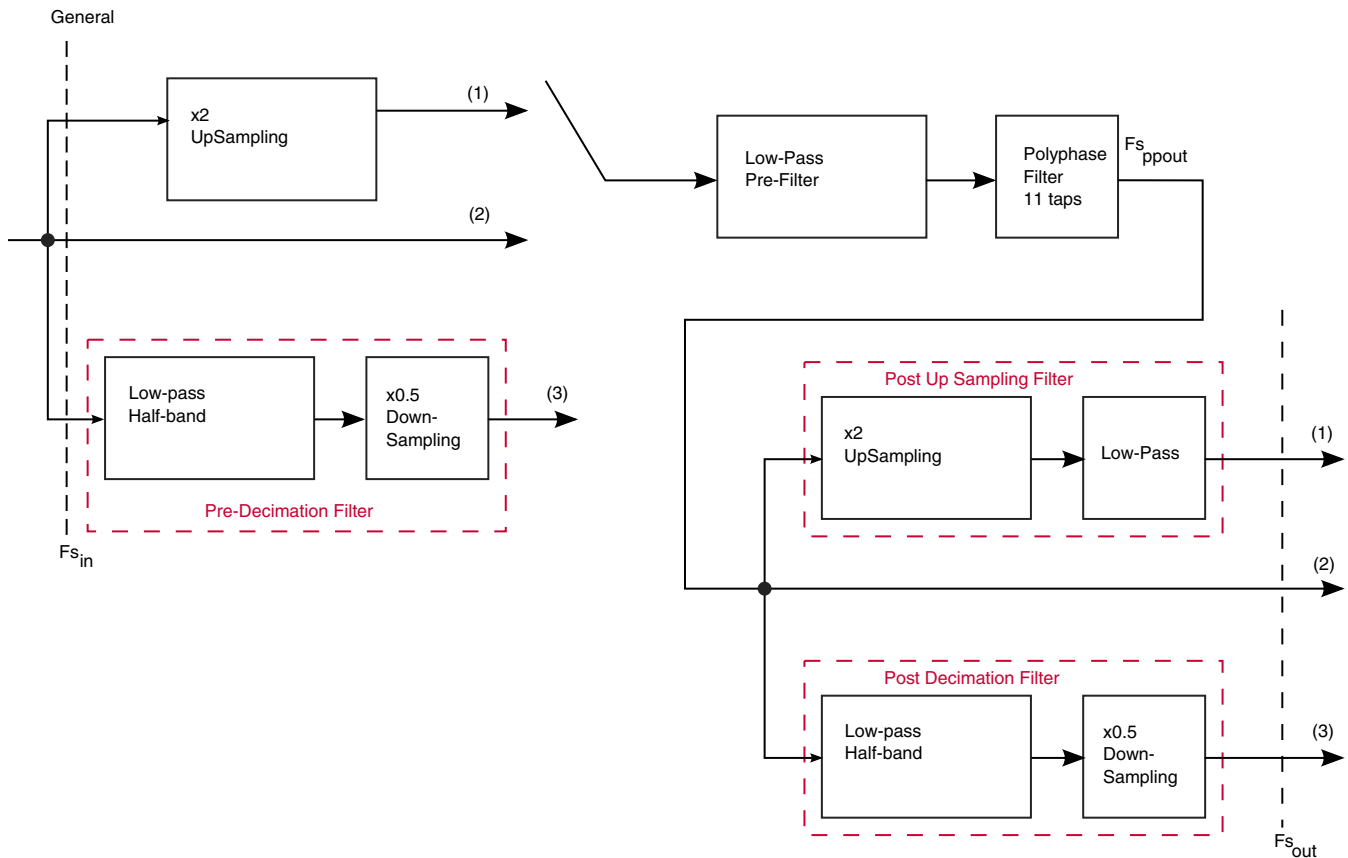

Figure 15-3. Signal processing configurations

The figure above shows the possible configurations of the ASRC. Each configuration consists of 2 to 4 stages.

- x2 up-sampling rate expander (zero insertion only) (input branch 1), direct connection (input branch 2), or low-pass pre decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (input branch 3),
- low-pass pre-filter, the low-pass bandwidth is at most $0.25 \times F_s$, where F_s is the sampling rate of the input signal to this low-pass pre-filter,
- polyphase filter,
- x2 post upsampling filter (consisting of a x2 up-sampling rate expander (zero insertion only) with low-pass half-band FIR filter) (output branch 1), direct connection (output branch 2), or low-pass post decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (output branch 3).

By flowing through different processing branches and different setups of the pre-filter, this ASRC scheme can be used to handle different rate conversion requirements.

- Configuration (a): Input Branch 1+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = F_{s_{in}}/2$.
 The signal sampling rate of the polyphase filter output is $F_{s_{ppout}} = F_{s_{out}}/2$.

- Configuration (b): Input Branch 1+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = F_{s_{in}}/2$.
 The signal sampling rate of the polyphase filter output is $F_{s_{ppout}} = F_{s_{out}}$.

- Configuration (c): Input Branch 1+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = F_{s_{in}}/2$.
 The signal sampling rate of the polyphase filter output is $F_{s_{ppout}} = 2F_{s_{out}}$.

- Configuration (d): Input Branch 2+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = F_{s_{in}}/4$.
 The signal sampling rate of the polyphase filter output is $F_{s_{ppout}} = F_{s_{out}}/2$.

- Configuration (e): Input Branch 2+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = F_{s_{in}}/4$.
 The signal sampling rate of the polyphase filter output is $F_{s_{ppout}} = F_{s_{out}}$.

- Configuration (f): Input Branch 2+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = F_{s_{in}}/4$.
 The signal sampling rate of the polyphase filter output is $F_{s_{ppout}} = 2F_{s_{out}}$.

- Configuration (g): Input Branch 3+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = F_{s_{in}}/8$.
 The signal sampling rate of the polyphase filter output is $F_{s_{ppout}} = F_{s_{out}}/2$.

- Configuration (h): Input Branch 3+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = F_{s_{in}}/8$.
 The signal sampling rate of the polyphase filter output is $F_{s_{ppout}} = F_{s_{out}}$.

- Configuration (i): Input Branch 3+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = F_{s_{in}}/8$.
 The signal sampling rate of the polyphase filter output is $F_{s_{ppout}} = 2F_{s_{out}}$.

Table 15-7. Pre-processing, post-processing options

| {Pre_Proc, Post_Proc} | | Fsout (KHz) | | | | | | | | |
|--------------------------|------|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| | | 8 | 32 | 44.1 | 48 | 64 | 88.2 | 96 | 128 | 192 |
| Fsin (KHz) | 8 | {0,1} | {0,0} | {0,0} | {0,0} | {0,0} | {0,0} | {0,0} | {0,0} | {0,0} |
| | 12 | {0,2} | {0,1} | {0,0} | {0,0} | {0,0} | {0,0} | {0,0} | {0,0} | {0,0} |
| | 16 | {1,2} | {0,1} | {0,1} | {0,1} | {0,0} | {0,0} | {0,0} | {0,0} | {0,0} |
| | 24 | {1,2} | {0,1} | {0,1} | {0,1} | {0,1} | {0,0} | {0,0} | {0,0} | {0,0} |
| | 32 | {1,2} | {0,1} | {0,1} | {0,1} | {0,1} | {0,1} | {0,0} | {0,0} | {0,0} |
| | 44.1 | {2,2} | {0,2} | {0,1} | {0,1} | {0,1} | {0,1} | {0,1} | {0,0} | {0,0} |
| | 48 | {2,2} | {0,2} | {0,2} | {0,1} | {0,1} | {0,1} | {0,1} | {0,1} | {0,0} |
| | 64 | {2,2} | {0,2} | {0,2} | {0,2} | {0,1} | {0,1} | {0,1} | {0,1} | {0,0} |
| | 88.2 | NA | {1,2} | {1,2} | {1,2} | {1,1} | {1,1} | {1,1} | {1,1} | {1,1} |
| | 96 | NA | {1,2} | {1,2} | {1,2} | {1,1} | {1,1} | {1,1} | {1,1} | {1,1} |
| | 128 | NA | {1,2} | {1,2} | {1,2} | {1,1} | {1,1} | {1,1} | {1,1} | {1,1} |
| | 192 | NA | {2,2} | {2,2} | {2,2} | {2,1} | {2,1} | {2,1} | {2,1} | {2,1} |

NOTE: In the {Pre_Proc, Post_Proc} pair, the meaning of the values are:

Pre_Proc:

- 0 --- Pre-processing Branch 1 as shown in [Figure 15-3](#)
- 1 --- Pre-processing Branch 2 as shown in [Figure 15-3](#)
- 2 --- Pre-processing Branch 3 as shown in [Figure 15-3](#), decimation-by-2

Post_Proc:

- 0 --- Post-processing Branch 1 as shown in [Figure 15-3](#)
- 1 --- Post-processing Branch 2 as shown in [Figure 15-3](#)
- 2 --- Post-processing Branch 3 as shown in [Figure 15-3](#)

The latencies of the different option can be roughly calculated as follows:

- For PreProc = 0, PostProc = 1 : min latency = constant_A / input-sample-rate + constant_B / output-sample-rate
- For PreProc = 0, PostProc = 0 : min latency = constant_A / input-sample-rate + constant_C / output-sample-rate
- For PreProc = 1, PostProc = 1 : min latency = constant_D / input-sample-rate + constant_B / output-sample-rate

The constants above (e.g., constant_A means the Constant for Preproc = 0, constant_B means the Constant for Postproc = 1, ...) are only influenced by the PreProc/PostProc and (input/output) sampling rate to which they are connected. Input latencies have no relationship with the output latencies, but both elements add together to form the total latencies.

For a rough estimation, the constants can be set as:

- Constant for Preproc = 0: 39

- Constant for Preproc = 1: 78.5
- Constant for Preproc = 2: 235
- Constant for Postproc = 0: 42.5
- Constant for Postproc = 1: 8.5
- Constant for Postproc = 2: 172

The max latency can be derived from this value by using the following formula (where 32 means the input/output FIFO depth that will arouse data transfer):

- $\text{max latency} = \text{min latency} + 32 / \text{input-sample-rate} + 32 / \text{output-sample-rate}$

15.5.1.2 Operation of the Filter

15.5.1.2.1 Support of Physical Clocks

This design supports physical sampling clocks. The clocks can be provided by Sony/Phillips digital interface (SPDIF), enhanced serial audio interface (ESAI), standard serial interface (SSI-1, SSI-2, SSI-3), media local bus controller (MLB) , Core master clock derivative as ASRCK1 .

Functional Description

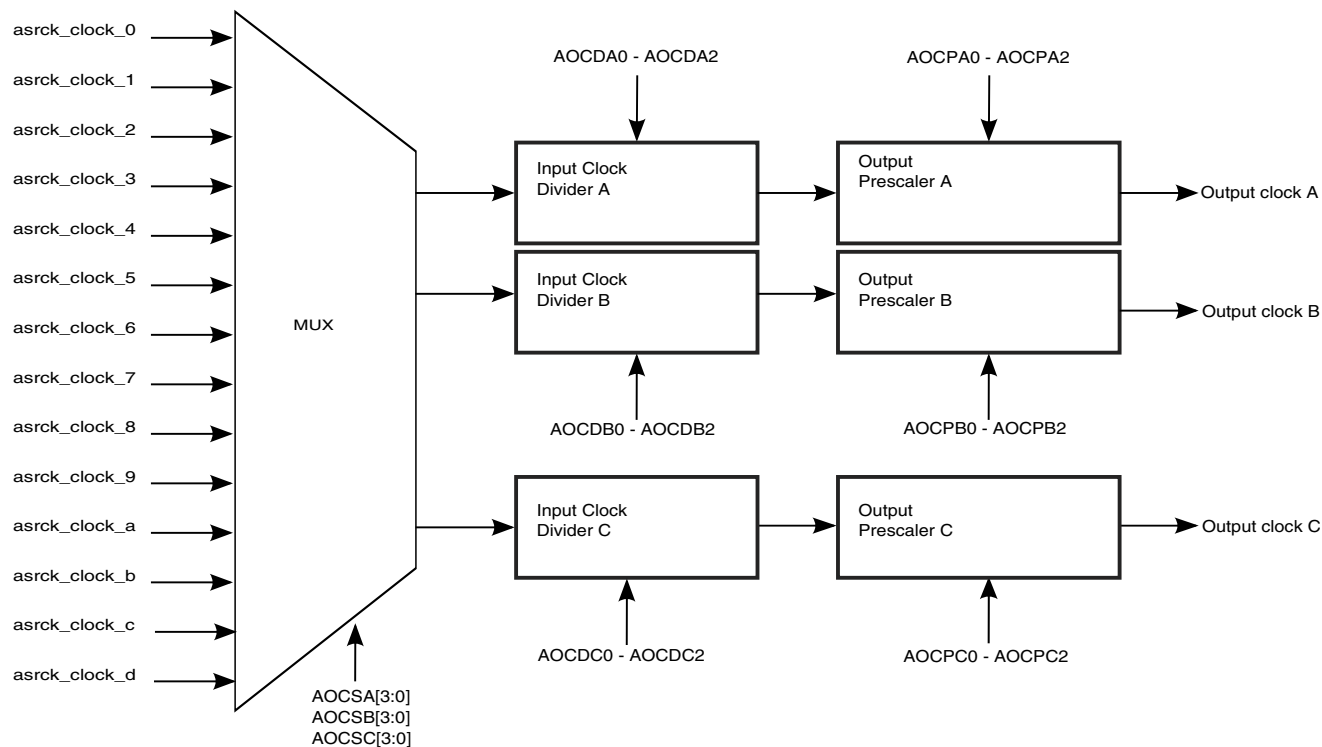

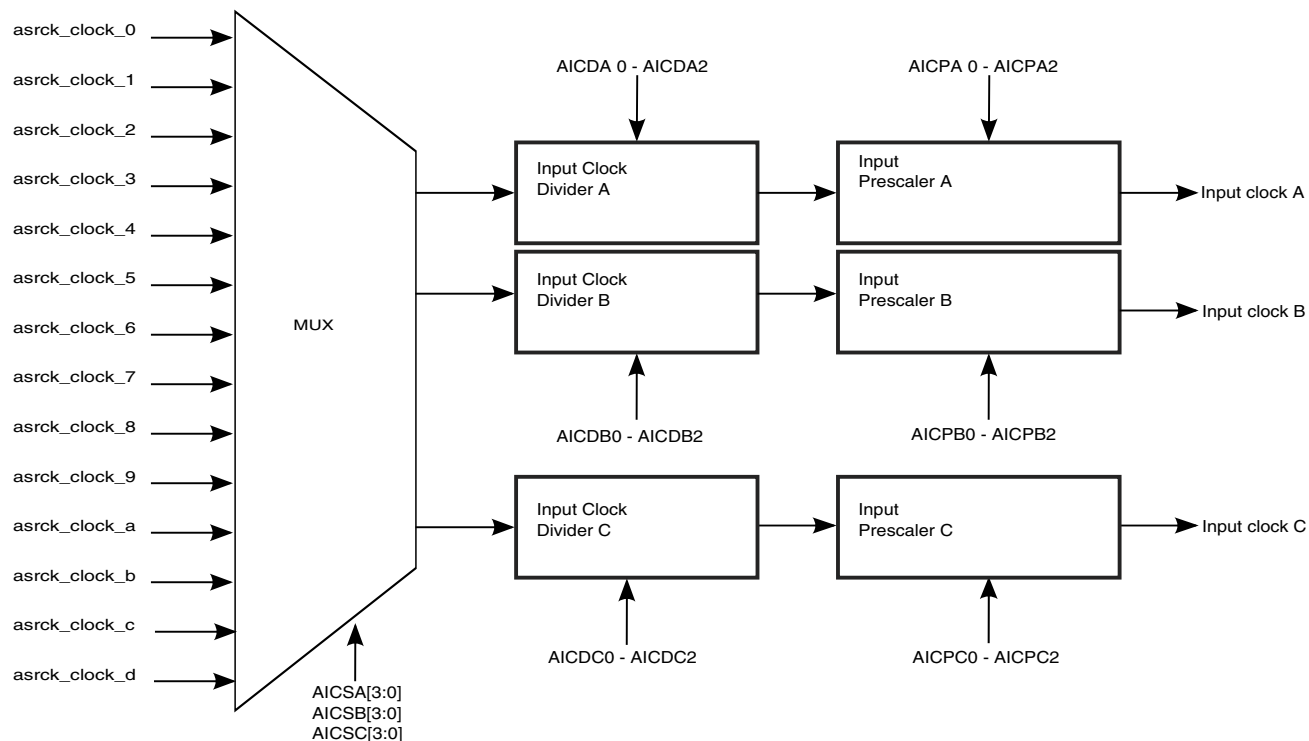

Figure 15-4. Clock Source Selector & Divider

Software can set the ASRC Clock Source Register (ASRC_CSR) and the Clock Divider Register to select the desired clock source and divide it to the needed sample rate clock for use by the ASRC. The clocks have the following restriction. If the prescaler is set to 1, the clock divider can only be set to 1 and the clock source must have a 50% duty cycle.

15.6 Startup Procedure

The following example shows the normal setup procedure for the ASRC block.

```
#include "asrc_common.h"

#include "stdio.h"

#include "soc_api.h"

int incnt=0;

int outcnt=0;

#include "wy_ideal_ratio_dataini_part.h"

WORD IdealRatio_High=0x04; //

WORD IdealRatio_Low=0x0; //

void asrc_config_alloc(WORD ASRCCTR_VAL, WORD ASRIER_VAL, WORD ASRCNCR_VAL,
                      WORD ASRCFG_VAL, WORD ASRCDR1_VAL, WORD ASRCDR2_VAL,
                      WORD ASRC_CSR_VAL)

{ // Disable ASRC

    reg32_write(ASRC_ASRCCTR, 0x0);

    reg32_write(ASRC_ASRCCTR, ASRCCTR_VAL);

    reg32_write(ASRC_ASRIER, ASRIER_VAL);

    reg32_write(ASRC_ASRIEM, 0x0);

    reg32_write(ASRC_ASRCNCR, ASRCNCR_VAL);

    reg32_write(ASRC_ASRCFG, ASRCFG_VAL);

    reg32_write(ASRC_ASRCDR1, ASRCDR1_VAL);

15.7 ASRC Memory Map/Register Definition

All useful registers are listed in the memory map below. The access of undefined registers will behave as normal registers.

All the interface registers are LSB aligned except the input FIFOs and the output FIFOs, and each register has only 24 effective bits.

The input FIFO and output FIFO word alignment can be defined using ASRMCR1{A,B,C} registers in 32-bit interface system.

ASRC memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |

ASRC_ASRCCTR field descriptions

| Field | Description |
|--------------------------|--|
| 31–24 [unimplemented] | This is a 24-bit register the upper byte is unimplemented. This field is reserved. |
| 23 - | This field is reserved. Reserved. Should be written as zero for compatibility. |
| 22 ATSC | ASRC Pair C Automatic Selection For Processing Options When this bit is 1, pair C will automatic update its pre-processing and post-processing options (ASRCFG: PREMODC, ASRCFG:POSTMODC see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair C. This bit should be disabled when {USRC, IDRC}={1,1}. |
| 21 ATSB | ASRC Pair B Automatic Selection For Processing Options When this bit is 1, pair B will automatic update its pre-processing and post-processing options (ASRCFG: PREMODB, ASRCFG:POSTMODB see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair B. This bit should be disabled when {USRB, IDRB}={1,1}. |
| 20 ATSA | ASRC Pair A Automatic Selection For Processing Options When this bit is 1, pair A will automatic update its pre-processing and post-processing options (ASRCFG: PREMODA, ASRCFG:POSTMODA see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair A. This bit should be disabled when {USRA, IDRA}={1,1}. |
| 19 - | This field is reserved. Reserved. Should be written as zero for compatibility. |
| 18 USRC | Use Ratio for Pair C Use ratio as the input to ASRC. This bit is used in conjunction with IDRC control bit. |
| 17 IDRC | Use Ideal Ratio for Pair C When USRC=0, this bit has no usage. When USRC=1 and IDRC=0, ASRC internal measured ratio will be used. When USRC=1 and IDRC=1, the idea ratio from the interface register ASRIDRHC, ASRIDRLC will be used. It is suggested to manually set ASRCFG:POSTMODC, ASRCFG:PREMODC according to Table 15-7 in this case. |
| 16 USRB | Use Ratio for Pair B Use ratio as the input to ASRC. This bit is used in conjunction with IDRB control bit. |
| 15 IDRB | Use Ideal Ratio for Pair B When USRB=0, this bit has no usage. When USRB=1 and IDRB=0, ASRC internal measured ratio will be used. |

Table continues on the next page...

ASRC_ASRCTR field descriptions (continued)

| Field | Description |
|-------------|--|
| | When USRB=1 and IDRB=1, the idea ratio from the interface register ASRIDRHB, ASRIDRLB will be used. It is suggested to manually set ASRCFG:POSTMODB, ASRCFG:PREMODB according to Table 15-7 in this case. |
| 14 USRA | Use Ratio for Pair A Use ratio as the input to ASRC. This bit is used in conjunction with IDRA control bit. |
| 13 IDRA | Use Ideal Ratio for Pair A When USRA=0, this bit has no usage. When USRA=1 and IDRA=0, ASRC internal measured ratio will be used. When USRA=1 and IDRA=1, the idea ratio from the interface register ASRIDRHA, ASRIDRLA will be used. It is suggested to manually set ASRCFG:POSTMODA, ASRCFG:PREMODA according to Table 15-7 in this case. |
| 12–5 - | This field is reserved. Reserved. Should be written as zero for compatibility. |
| 4 SRST | Software Reset This bit is self-clear bit. Once it is been written as 1, it will generate a software reset signal inside ASRC. After 9 cycles of the ASRC processing clock, this reset process will stop, and this bit will be cleared automatically. |
| 3 ASREC | ASRC Enable C Enable the operation of the conversion C of ASRC. When ASREC is cleared, operation of conversion C is disabled. |
| 2 ASREB | ASRC Enable B Enable the operation of the conversion B of ASRC. When ASREB is cleared, operation of conversion B is disabled. |
| 1 ASREA | ASRC Enable A Enable the operation of the conversion A of ASRC. When ASREA is cleared, operation of conversion A is disabled. |
| 0 ASRCEN | ASRC Enable Enable the operation of ASRC. |

15.7.2 ASRC Interrupt Enable Register (ASRC_ASRIER)

Address: 203_4000h base + 4h offset = 203_4004h

15.7.3 ASRC Channel Number Configuration Register (ASRC_ASRCNCR)

The ASRC channel number configuration register (ASRCNCR) is a 24-bit read/write register that sets the number of channels used by each ASRC conversion pair.

There are 10 channels available for distribution among 3 conversion pairs, they are ordered as 0,1,...,9. The bottom [0, ANCA-1] channels are used for pair A, the top [10-ANCC, 9] channels are used for pair C, and the [ANCA, ANCA+ANCB-1] channels are allocated for pair B. In case that ANCA=0, then the [0, ANCB-1] channels are assigned for pair B.

Address: 203_4000h base + Ch offset = 203_400Ch

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

| Field | Description |
|---------------|---|
| 23–22 - | This field is reserved. Reserved. Should be written as zero for compatibility. |
| 21 DSL CNT | DSL Counter Input to FIFO ready When set, this bit indicates that new DSL counter information is stored in the internal ASRC FIFO. When clear, this bit indicates that new DSL counter information is in the process of storage into the internal ASRC FIFO. When ASRIER:AFPWE=1, the rising edge of this signal will propose an interrupt request. Writing any value with this bit set will clear the interrupt request proposed by the rising edge of this bit. |
| 20 ATQOL | Task Queue FIFO overload When set, this bit indicates that task queue FIFO logic is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1. |
| 19 AOOLC | Pair C Output Task Overload When set, this bit indicates that pair C output task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1. |
| 18 AOOLB | Pair B Output Task Overload When set, this bit indicates that pair B output task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1. |
| 17 AOOLA | Pair A Output Task Overload When set, this bit indicates that pair A output task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1. |
| 16 AIOLC | Pair C Input Task Overload When set, this bit indicates that pair C input task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1. |
| 15 AIOLB | Pair B Input Task Overload When set, this bit indicates that pair B input task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1. |
| 14 AIOLA | Pair A Input Task Overload When set, this bit indicates that pair A input task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1. |
| 13 AODOC | Output Data Buffer C has overflowed When set, this bit indicates that output data buffer C has overflowed. When clear, this bit indicates that output data buffer C has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1. |
| 12 AODOB | Output Data Buffer B has overflowed |

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

| Field | Description |
|-------------|---|
| | When set, this bit indicates that output data buffer B has overflowed. When clear, this bit indicates that output data buffer B has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1. |
| 11 AODOA | Output Data Buffer A has overflowed When set, this bit indicates that output data buffer A has overflowed. When clear, this bit indicates that output data buffer A has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1. |
| 10 AIDUC | Input Data Buffer C has underflowed When set, this bit indicates that input data buffer C has underflowed. When clear, this bit indicates that input data buffer C has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1. |
| 9 AIDUB | Input Data Buffer B has underflowed When set, this bit indicates that input data buffer B has underflowed. When clear, this bit indicates that input data buffer B has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1. |
| 8 AIDUA | Input Data Buffer A has underflowed When set, this bit indicates that input data buffer A has underflowed. When clear, this bit indicates that input data buffer A has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1. |
| 7 FPWT | FP is in wait states This bit is for debug only. When set, this bit indicates that ASRC is in wait states. When clear, this bit indicates that ASRC is not in wait states. |
| 6 AOLE | Overload Error Flag When set, this bit indicates that the task rate is too high for the ASRC to handle. The reasons for overload may be: <ul style="list-style-type: none"> - too high input clock frequency, - too high output clock frequency, - incorrect selection of the pre-filter, - low ASRC processing clock, - too many channels, - underrun, - or any combination of the reasons above. Since the ASRC uses the same hardware resources to perform various tasks, the real reason for the overload is not straight forward, and it should be carefully analyzed by the programmer. If ASRIER:AOLIE=1, an interrupt will be proposed when this bit is set. Write any value with this bit set as one into the status register will clear this bit and the interrupt request proposed by this bit. |
| 5 AODFC | Number of data in Output Data Buffer C is greater than threshold |

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

| Field | Description |
|------------|---|
| | When set, this bit indicates that number of data already existing in ASRDORC is greater than threshold and the processor can read data from ASRDORC. When AODFC is set, the ASRC generates data output C interrupt request to the processor, if enabled (that is, ASRIER:ADOEC = 1). A DMA request is always generated when the AODFC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event. |
| 4 AODFB | Number of data in Output Data Buffer B is greater than threshold When set, this bit indicates that number of data already existing in ASRDORB is greater than threshold and the processor can read data from ASRDORB. When AODFB is set, the ASRC generates data output B interrupt request to the processor, if enabled (that is, ASRIER:ADOEB = 1). A DMA request is always generated when the AODFB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event. |
| 3 AODFA | Number of data in Output Data Buffer A is greater than threshold When set, this bit indicates that number of data already existing in ASRDORA is greater than threshold and the processor can read data from ASRDORA. When AODFA is set, the ASRC generates data output A interrupt request to the processor, if enabled (that is, ASRIER:ADOEA = 1). A DMA request is always generated when the AODFA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event. |
| 2 AIDEC | Number of data in Input Data Buffer C is less than threshold When set, this bit indicates that number of data still available in ASRDIRC is less than threshold and the processor can write data to ASRDIRC. When AIDEC is set, the ASRC generates data input C interrupt request to the processor, if enabled (that is, ASRIER:ADIEC = 1). A DMA request is always generated when the AIDEC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event. |
| 1 AIDEB | Number of data in Input Data Buffer B is less than threshold When set, this bit indicates that number of data still available in ASRDIRB is less than threshold and the processor can write data to ASRDIRB. When AIDEB is set, the ASRC generates data input B interrupt request to the processor, if enabled (that is, ASRIER:ADIEB = 1). A DMA request is always generated when the AIDEB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event. |
| 0 AIDEA | Number of data in Input Data Buffer A is less than threshold When set, this bit indicates that number of data still available in ASRDIRA is less than threshold and the processor can write data to ASRDIRA. When AIDEA is set, the ASRC generates data input A interrupt request to the processor, if enabled (that is, ASRIER:ADIEA = 1). A DMA request is always generated when the AIDEA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event. |

15.7.9 ASRC Parameter Register n (ASRC_ASRPMnn)

Parameter registers determine the performance of ASRC.

The parameter registers must be initialized by software before ASRC is enabled.
Recommended values are given in [ASRC Misc Control Register 1 for Pair C](#) below,

Table 15-21. ASRC Parameter Registers (ASRPM1~ASRPM5)

| Register | Offset | Access | Reset Value | Recommend Value |
|----------|--------|--------|-------------|-----------------|
| asrcpm1 | 0x40 | R/W | 0x00_0000 | 0x7fffff |
| asrcpm2 | 0x44 | R/W | 0x00_0000 | 0x255555 |
| asrcpm3 | 0x48 | R/W | 0x00_0000 | 0xff7280 |
| asrcpm4 | 0x4C | R/W | 0x00_0000 | 0xff7280 |
| asrcpm5 | 0x50 | R/W | 0x00_0000 | 0xff7280 |

Address: 203_4000h base + 40h offset + (4d × i), where i=0d to 4d

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----------|----|----|----|----|----|----|----|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

ASRC_ASRTFR1 field descriptions (continued)

| Field | Description |
|------------------|---|
| 19–13 TF_FILL | Current number of entries in task queue FIFO. |
| 12–6 TF_BASE | Base address for task queue FIFO. Set to 0x7C. |
| 5–0 - | This field is reserved. Reserved. Should be written as zero for compatibility. |

15.7.11 ASRC Channel Counter Register (ASRC_ASRCCR)

The ASRC channel counter register (ASRCCR) is a 24-bit read/write register that sets and reflects the current specific input/output FIFO being accessed through shared peripheral bus for each ASRC conversion pair.

Address: 203_4000h base + 5Ch offset = 203_405Ch

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

15.7.19 ASRC Ideal Ratio for Pair C-Low Part (ASRC_ASRIDRLC)

The ideal ratio registers (ASRIDRHC, ASRIDRLC) hold the ratio value IDRATIOC. $IDRATIOC = F_{s_{inC}}/F_{s_{outC}} = T_{s_{outC}}/T_{s_{inC}}$ is a 32-bit fixed point value with 26 fractional bits. This value is only useful when $ASRC_{CTR}:\{USRC, IDRC\}=2'b11$.

15.7.20 ASRC 76kHz Period in terms of ASRC processing clock (ASRC_ASR76K)

The register (ASR76K) holds the period of the 76kHz sampling clock in terms of the ASRC processing clock with frequency $F_{S_{ASRC}}$. $ASR76K = F_{S_{ASRC}}/F_{S_{76k}}$. Reset value is 0x0A47 which assumes that $F_{S_{ASRC}}=200\text{MHz}$. This register is used to help the ASRC internal logic to decide the pre-processing and the post-processing options automatically (see [ASRC Misc Control Register 1 for Pair C](#) and [ASRC Misc Control Register 1 for Pair C](#)). In a system when $F_{S_{ASRC}}=133\text{MHz}$, the value should be assigned explicitly as 0x06D6 in user application code.

15.7.21 ASRC 56kHz Period in terms of ASRC processing clock (ASRC_ASR56K)

The register (ASR56K) holds the period of the 56kHz sampling clock in terms of the ASRC processing clock with frequency $F_{S_{ASRC}}$. $ASR56K = F_{S_{ASRC}}/F_{S_{56k}}$. Reset value is 0x0DF3 which assumes that $F_{S_{ASRC}}=200MHz$. This register is used to help the ASRC internal logic to decide the pre-processing and the post-processing options automatically (see [ASRC Misc Control Register 1 for Pair C](#) and [ASRC Misc Control Register 1 for Pair C](#)). In a system when $F_{S_{ASRC}}=133MHz$, the value should be assigned explicitly as 0x0947 in user application code.

ASRC_ASRMCR1n field descriptions

| Field | Description |
|--------------------------|--|
| 31–24 [unimplemented] | This is a 24-bit register the upper byte is unimplemented. This field is reserved. |
| 23–12 - | This field is reserved. Reserved. Should be written as zero for future compatibility. |
| 11–9 IWD[2:0] | Data Width of the input FIFO These three bits will determine the bitwidth for the audio data into ASRC All other settings not shown are reserved. 3'b000 24-bit audio data. |

Table continues on the next page...

ASRC_ASRMCR1n field descriptions (continued)

| Field | Description |
|-----------|--|
| | 3'b001 16-bit audio data. 3'b010 8-bit audio data. |
| 8 IMSB | Data Alignment of the input FIFO This bit will determine the data alignment of the input FIFO. 1 MSB aligned. 0 LSB aligned. |
| 7–3 - | This field is reserved. Reserved. Should be written as zero for future compatibility. |
| 2 OMSB | Data Alignment of the output FIFO This bit will determine the data alignment of the output FIFO. 1 MSB aligned. 0 LSB aligned. |
| 1 OSGN | Sign Extension Option of the output FIFO This bit will determine the sign extension option of the output FIFO. 1 Sign extension. 0 No sign extension. |
| 0 OW16 | Bit Width Option of the output FIFO This bit will determine the bit width option of the output FIFO. 1 16-bit output data 0 24-bit output data. |

Chapter 16

Digital Audio Multiplexer (AUDMUX)

16.1 Overview

The Digital Audio Multiplexer (AUDMUX) provides a programmable interconnect device for voice, audio, and synchronous data routing between Synchronous Serial Interface Controller (SSI) and audio/voice codec's (also known as coder-decoders) peripheral serial interfaces.

This section includes a top level diagram that shows the functional organization of the block, including all off-chip signals.

AUDMUX allows the users to reconfigure the audio system signal routing through programming, as opposed to altering the PCB design. The full description of the block is in [Functional Description](#).

[Figure 16-1](#) shows the block diagram.

Figure 16-1. AUDMUX Block Diagram

AUDMUX supports single source to single destination connectivity or single source to multiple destination connectivity.

AUDMUX includes two types of interfaces: Internal ports and External ports. Internal ports are hard wired to Synchronous Serial Interface Controller (SSI). The connection between each SSI and AUDMUX's Internal ports cannot be modified, however, routing of the signals connected to each of the internal port can be routed within AUDMUX. External ports are connected to IOMUX module where the ports connect to off-chip audio devices and serial interfaces of other processors. The connectivity of the External port and IOMUX cannot be configured, but the output or input of the signal can be routed easily by setting the appropriate AUDMUX registers.

16.1.1 Features

Key features of the block include:

- Two or Three internal ports (depends on number of SSI supported on the device)
- Four external ports
- Full 6-wire SSI interfaces for asynchronous receive and transmit
- Configurable 4-wire (synchronous) or 6-wire (asynchronous) peripheral interfaces
- Independent Tx/Rx Frame sync and clock direction selection for host or peripheral
- Each host interface's capability to connect to any other host or peripheral interface in a point-to-point or point-to-multipoint (network mode)

16.1.2 Modes and Operations

The AUDMUX supports the modes described in [Operating Modes](#).

16.2 External Signals

The following table describes the external signals of AUDMUX:

Table 16-1. AUDMUX External Signals

| Signal | Description | Pad | Mode | Direction |
|------------------|---------------------------|------------|------|-----------|
| AUD3_RXC (RXC) | Receive clock signal | CSI0_DAT10 | ALT1 | IO |
| AUD3_RXD (RXD) | Data receive signal | CSI0_DAT7 | ALT4 | IO |
| AUD3_RXFS (RXFS) | Receive Frame sync signal | CSI0_DAT11 | ALT1 | IO |
| AUD3_TXC (TXC) | Transmit clock signal | CSI0_DAT4 | ALT4 | IO |

Table continues on the next page...

Table 16-1. AUDMUX External Signals (continued)

| Signal | Description | Pad | Mode | Direction |
|------------------|----------------------------|-------------|------|-----------|
| AUD3_TXD (TXD) | Data transmit signal | CSI0_DAT5 | ALT4 | IO |
| AUD3_TXFS (TXFS) | Transmit Frame sync signal | CSI0_DAT6 | ALT4 | IO |
| AUD4_RXC (RXC) | Receive clock signal | DISP0_DAT19 | ALT4 | IO |
| | | SD2_CMD | ALT3 | |
| AUD4_RXD (RXD) | Data receive signal | DISP0_DAT23 | ALT3 | IO |
| | | SD2_DAT0 | ALT3 | |
| AUD4_RXFS (RXFS) | Receive Frame sync signal | DISP0_DAT18 | ALT4 | IO |
| | | SD2_CLK | ALT3 | |
| AUD4_TXC (TXC) | Transmit clock signal | DISP0_DAT20 | ALT3 | IO |
| | | SD2_DAT3 | ALT3 | |
| AUD4_TXD (TXD) | Data transmit signal | DISP0_DAT21 | ALT3 | IO |
| | | SD2_DAT2 | ALT3 | |
| AUD4_TXFS (TXFS) | Transmit Frame sync signal | DISP0_DAT22 | ALT3 | IO |
| | | SD2_DAT1 | ALT3 | |
| AUD5_RXC (RXC) | Receive clock signal | DISP0_DAT14 | ALT3 | IO |
| | | EIM_D25 | ALT6 | |
| AUD5_RXD (RXD) | Data receive signal | DISP0_DAT19 | ALT3 | IO |
| | | KEY_ROW1 | ALT2 | |
| AUD5_RXFS (RXFS) | Receive Frame sync signal | DISP0_DAT13 | ALT3 | IO |
| | | EIM_D24 | ALT6 | |
| AUD5_TXC (TXC) | Transmit clock signal | DISP0_DAT16 | ALT3 | IO |
| | | KEY_COL0 | ALT2 | |
| AUD5_TXD (TXD) | Data transmit signal | DISP0_DAT17 | ALT3 | IO |
| | | KEY_ROW0 | ALT2 | |
| AUD5_TXFS (TXFS) | Transmit Frame sync signal | DISP0_DAT18 | ALT3 | IO |
| | | KEY_COL1 | ALT2 | |
| AUD6_RXC (RXC) | Receive clock signal | DISP0_DAT6 | ALT3 | IO |
| AUD6_RXD (RXD) | Data receive signal | DI0_PIN4 | ALT2 | IO |
| AUD6_RXFS (RXFS) | Receive Frame sync signal | DISP0_DAT5 | ALT3 | IO |
| AUD6_TXC (TXC) | Transmit clock signal | DI0_PIN15 | ALT2 | IO |
| AUD6_TXD (TXD) | Data transmit signal | DI0_PIN2 | ALT2 | IO |
| AUD6_TXFS (TXFS) | Transmit Frame sync signal | DI0_PIN3 | ALT2 | IO |

16.3 Clocks

This section provides information about AUDMUX clocking including clock inputs and the clock diagram.

The following table describes the clock source for AUDMUX. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 16-2. AUDMUX Clocks

| Clock name | Clock Root | Description |
|------------|--------------|-------------------------|
| ipg_clk_s | ipg_clk_root | Peripheral access clock |

16.3.1 Clock Inputs

The IP Bus read/write clock-peripheral clock (ipg_clk_s) is an input to the AUDMUX. It is used for all AUDMUX register accesses. It is driven only when there is an AUDMUX access on the IP Bus.

16.3.2 Clock Diagram

The figure below shows the clocking used in the AUDMUX.

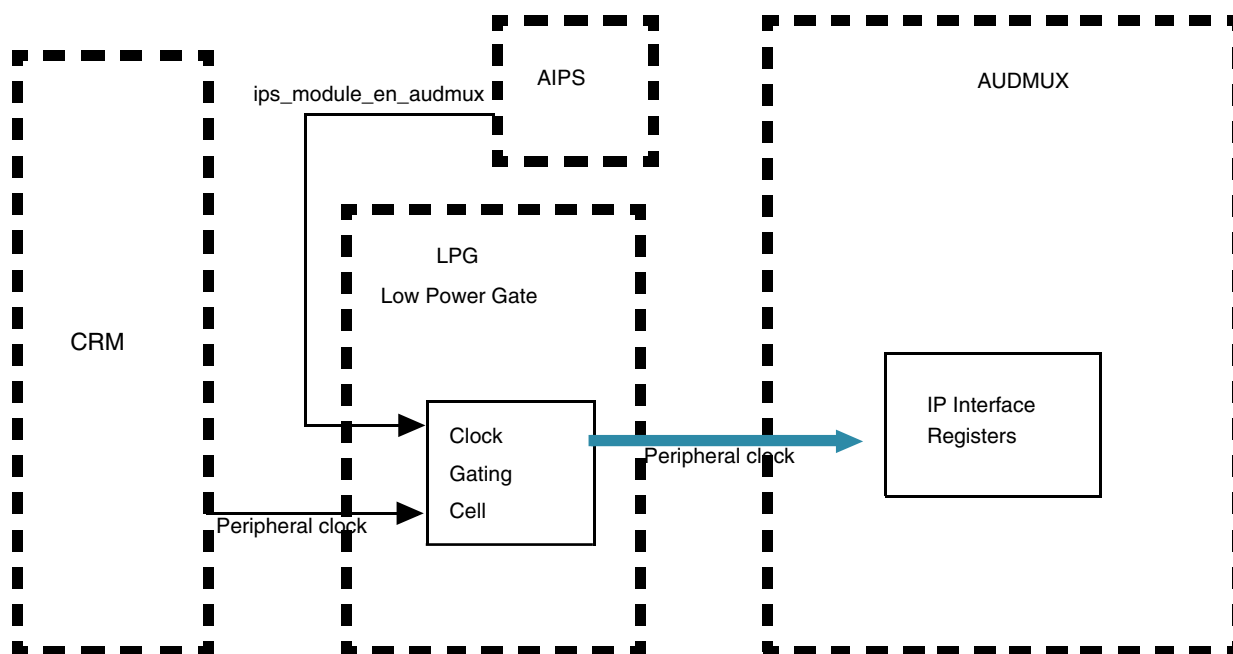

Figure 16-2. AUDMUX Clocking Scheme

16.3.3 Clocking Restrictions

- Since the AUDMUX requires only peripheral clock, it places no restrictions on the bus frequency.
- All registers in the AUDMUX are control registers so their values will not change frequently. These values will be programmed when changing between use cases (not during operation in a particular mode).

16.4 Default Register Configuration

There are two configuration registers for each port. Each pair of configuration registers is identical for each port; however, the default values following a reset differ as shown in the Memory Map.

[Default Port Configuration](#), describes the default configuration of the ports.

16.4.1 Default Port Configuration

After a reset, each port defaults to normal mode ($PDCR_n[MODE] = 0$) with synchronous timing mode ($PTCR_n[SYN] = 1$) enabled.

The default port-to-port connections are as follows:

- Port 1 to Port 6
 - Port 6 provides the clock and frame sync.
- Port 2 to Port 5
 - Port 5 provides the clock and frame sync.
- Port 3 to Port 4
 - Port 4 provides the clock and frame sync.
- Port 7 to Port 7 (in data loopback mode)
 - Clock and frame syncs are inputs.

16.5 Functional Description

This section provides a complete functional description of the AUDMUX.

16.5.1 Operating Modes

This section describes all functional operation modes of the AUDMUX.

Figure 16-1 shows the AUDMUX block diagram.

All of the ports are essentially identical; there is no functional difference among Ports 1 through 7. The main difference is whether a port is hard wired to synchronous serial interface (SSI) or hard wired to the chip's pads. Each of the connection is hard wired to specific AUDMUX port. AUDMUX provides flexibility in routing the signal within the module, but all Internal and External port connections are fixed to specific configuration.

All ports can be configured as four- or six-wire interfaces. When configured as a six-wire interface, Receive Frame Sync (RXFS) and Receive Clock (RXC) signals of SSI interface enable the serial interface to be used in asynchronous mode with separate receive and transmit clocks.

AUDMUX supports both Normal mode (not to be confused with SSI's Normal Mode), External Network mode and Internal Network mode. The definition of each mode will be given in the next section.

All ports have a TXRXEN bit to provide flexibility in supporting network mode configurations. The TXRXEN bit reverses the functions of transmit and receive data lines where the transmit line is configured as receive and transmit line to be configured as transmit line. This function is provided so that mastership of the serial bus can be passed among multiple external devices connected to a single port.

In addition to supporting the External Network mode (default), all ports support an internal network mode:

- With internal network mode, single point-to-multipoint network configuration with an arbitrary number of slaves can be supported if the external slaves are put into the high-impedance state (as defined in the SSI network mode protocol) and have pull-up resistors on their TxD pins. (Alternatively, this can be viewed as requiring a pull-up resistor on the corresponding AUDMUX RxD pin.)

Bit clock direction selection enables each port to be configured as a master or slave in the flow.

Possible scenarios include:

- SSI (hard wired to internal port) transmits data to a voice codec and a BT (Blue tooth) codec (both on external Port 4Port 5) and the Bottom Connector (on external Port 5Port 6) simultaneously using network mode. SSI is configured as the master.
- An external processor (external port - Port 4Port 3) drives a voice codec and a BT codec (both on external Port 5Port 4) and the Bottom Connector (on Port 6Port 5) simultaneously using network mode. The external processor is the master.

16.5.1.1 Port Receive Data Modes

Each port has logic to select which data lines are used to create the RXD line for the corresponding host interface.

Figure 16-3 shows the logic used to create the RXD line for Port 1. This logic has the following modes of operation (as determined by MODE):

- Normal (not to be confused with SSI's normal mode)
- Internal network mode

The subsequent sections describe the various modes of the port receive data logic. The following terms are used to define the operation of the AUDMUX:

- Network mode- Time-Division Multiplexed protocol for sending unique data to multiple devices on a serial bus or single devices with multi-channel capabilities.
- Internal network mode-Physical bus configuration where multiple serial buses are effectively connected within the AUDMUX via digital logic to create point-to multipoint connectivity. An arbitrary number of devices are supported. Devices must be put into the high-impedance state as specified by the network mode protocol.
- External network mode-Physical bus configuration where multiple serial buses are electrically connected together on a printed circuit board (that is, external to the AUDMUX). Devices must put their TXD lines into the high-impedance state as specified by the network mode protocol. TXD lines of devices must be pulled high.

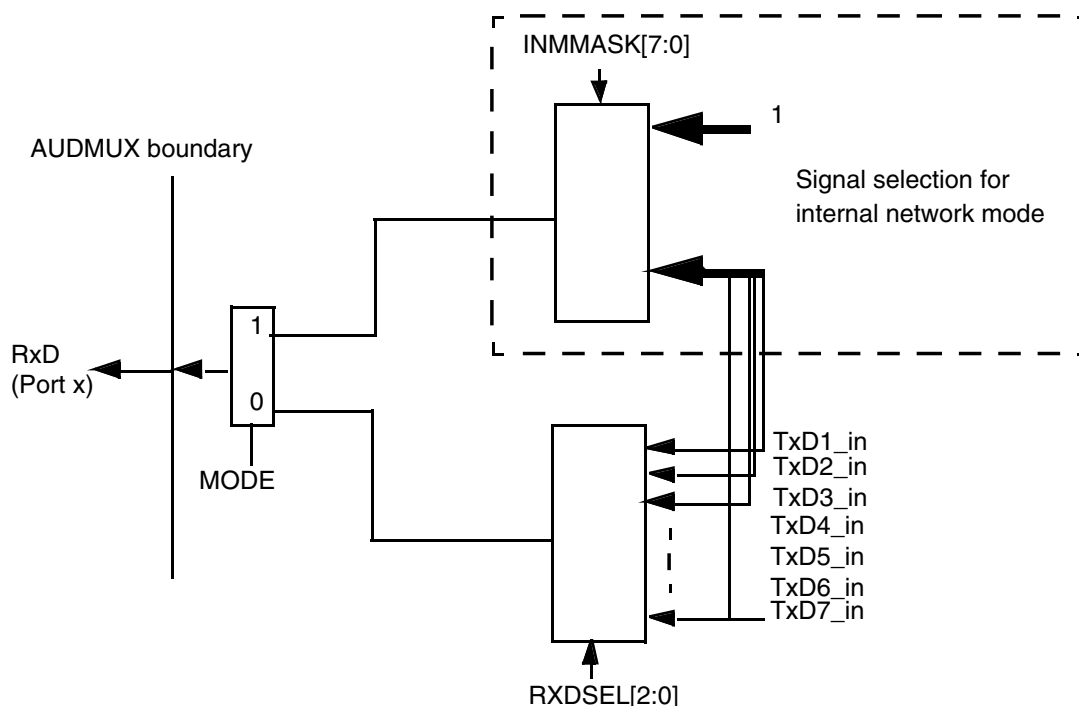

Figure 16-3. Receive Data Logic for Port x

16.5.1.1.1 Normal Mode

In normal mode (MODE = 0), not to be confused with SSI's Normal Mode, the port is connected in a single device point-to-single device port configuration (as a master or a slave) and the RXDSEL[2:0] setting selects the transmit signal from any port. In normal mode, any data format can be used (that is, SSI normal mode, SSI network mode, AC-97, and others).

If a user wishes to transmit SSI1's data (TXD) to port 5, PDCR5's RXDSEL[2:0] must be set to 000b. If the clock (TCK) and frame clock (TFS) are sent out to the external device from SSI1, PTCR5's TFSEL[3:0] and TCSEL[3:0] must be set to 0000b (port1) and 0000b (port1), while setting PTCR5's TFSDIR and TCLKDIR to 1.

If either or both of the clocks are to be received from external device to SSI1, PTCR5's TCLKDIR and/or TFSDIR must be set to 0 (input), and PTCR1's TFSEL[3:0] and/or TCLKDIR[3:0] to 0100b (port5).

Likewise, if a user wishes to receive serial data from Port 4 and send the receiving data to SSI2's RXD, one must set PDCR2's RXDSEL[2:0] to 11b. If the frame (RXFS) and bit clocks (RXC) are to be received from the external device, PTCR2's RFSEL[3:0] and RCSEL[3:0] must be set to 011b while PTCR4's RFSDIR and RCKDIR set to 1.

16.5.1.1.2 Internal Network Mode

In internal network mode (MODE = 1), the output of the AND gate is routed (via the output of the port) to the RXD signal of the corresponding host interface.

The INMMASK bit vector selects the transmit signals of the ports that are to be connected in network mode. The transmit signals received at the AUDMUX ports (TxDn_in) are ANDed together to form the output. In internal network mode, only one device can be transmitting in its predesignated timeslot and all other transmit signals must remain high (be in high-impedance state and pulled-up). Therefore, non-active signals in the selection will be high and do not influence the output of the AND gate.

Network mode is a protocol where a master SSI is connected to more than one slave SSI device and communication occurs on a time-slotted frame. Though network mode can allow master-slave and slave-slave communication, internal network mode supports only master-slave communication.

There are two scenarios where internal network mode can be used with external network mode:

1. Slave-only devices are attached to an external port.
2. A master device is attached to an external port and all slave devices connected to the same external port are disabled.

NOTE

When internal network mode is enabled at an external port, RXDSEL[3:0] for RxDn_obe selection is ignored and RxD_obe is always driven high (that is, asserted for all timeslots). All slave devices connected to the same port must be disabled.

Internal Network Mode Example 1

SSI_m and SSI_n are used with Port 3 in internal network mode as shown in [Figure 16-4](#). No pull-up resistors are required because the interfaces combined in internal network mode are on-chip interfaces.

Figure 16-4. Block Diagram For Example 1

See [Figure 16-5](#) for the timing diagram of Example 1. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for SSI_m and SSI_n (as well as their output enables) are shown. Note that the on-chip interfaces drive a logic '1' when their output enables are logic '0'. The combined TXD line, which is the logical AND of the individual TXD lines, is used for Port 3's TXD line.

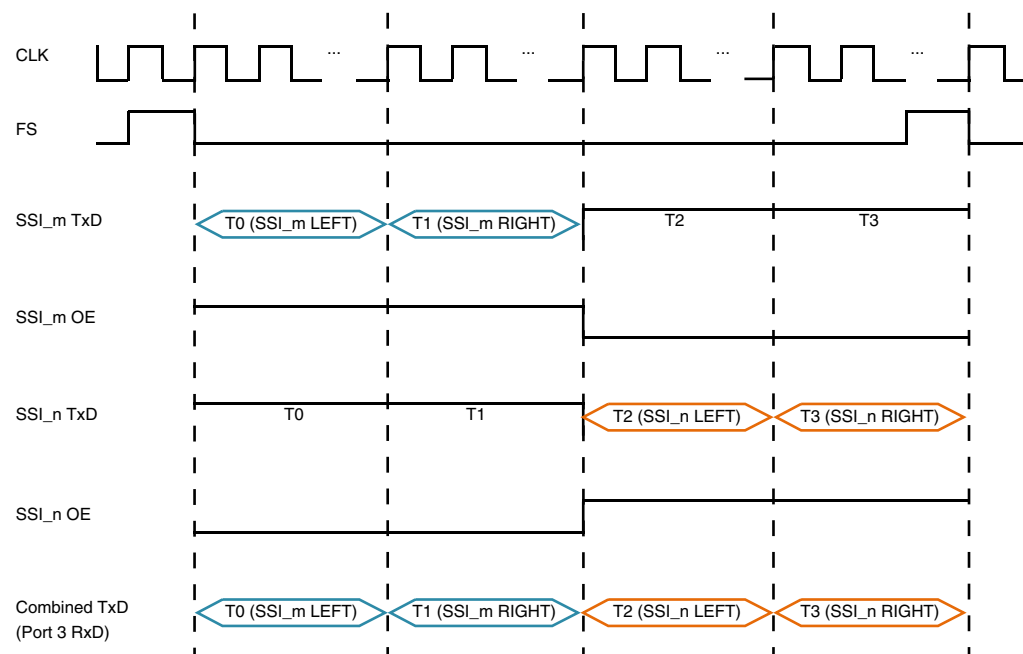

Figure 16-5. Example Using Internal Ports For Transmit Data

Internal Network Mode Example 2

The SSI, Port 3, and Port 4 are used with Port 5 in internal network mode, as shown in the following figure. Note that Port 3 and Port 4 are external ports. Therefore, pull-up resistors are required on the Port 3 RXD and Port 4 RXD pins. This example shows the timing associated with using adjacent timeslots for the SSI, Port 3 and Port 4 .

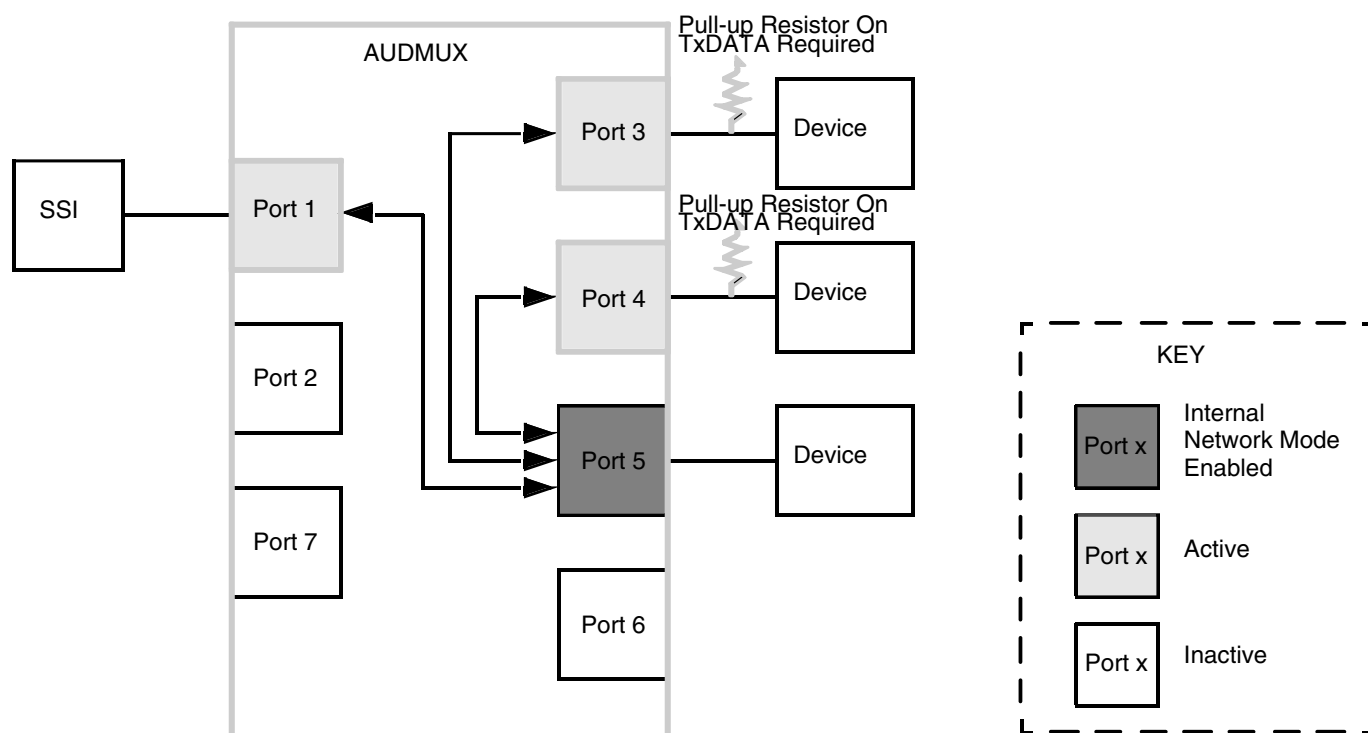

Figure 16-6. Block Diagram For Example 2

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' within half of a period of the bitclock. The required resistance must be no larger than:

$R_{max} = 1 / (2 * f_{bc} * C)$ where:

- f_{bc} is the frequency of the bitclock
- C is the total system capacitance (ICs, board traces, and so on)

The following figure shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI, Port 3 and Port 4 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data lines from Port 3 and Port 4 at the pad are pulled high by pull-up resistors when they are in the high-impedance state. The data lines from Port 3 and Port 4 at the AUDMUX are pure digital signals and are constantly driven. The combined TXD line, which is the logical AND of the SSI, Port 3 and Port 4's TXD lines, is used for Port 5's TXD line.

Note the highlighted areas in the [Figure 16-7](#). This shows the transition time that occurs while a TXD line is being pulled high. In this example, this transition time is a maximum of 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis should be enabled at Port 3's RXD pad and Port 4's RXD pad to prevent the digital signals created by the pad from toggling rapidly during the pull-up period. The pads typically require a transition within 25ns unless hysteresis is enabled. Instead of using hysteresis, one could select a pull-up resistor sufficiently high to pull-up the signal at the pad within 25 ns; however, that would result in a higher resistance value and higher current drain.

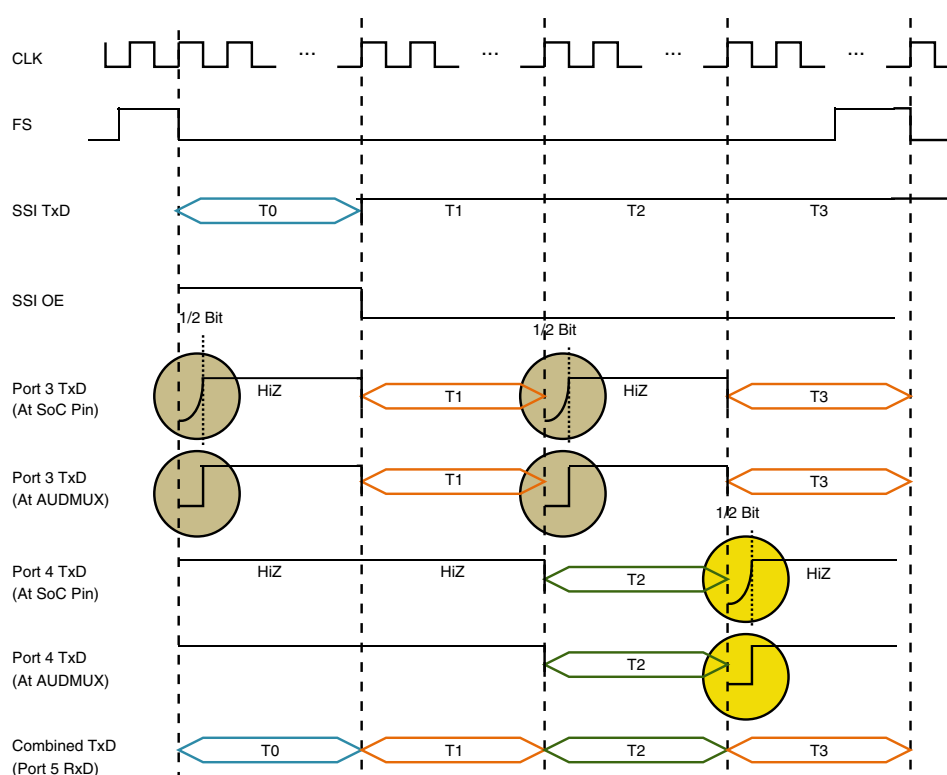

Figure 16-7. Example Using External Ports for Transmit Data in Consecutive Timeslots

Internal Network Mode Example 3

The SSI and Port 3 are used with Port 5 in internal network mode as shown in the following figure. Note that Port 3 is an external port. Therefore, a pull-up resistor is required on the Port 3TXD pin. This example shows the timing associated with inserting empty timeslots after the timeslots have been used by external ports.

Figure 16-8. Block Diagram For Example 3

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' by the time that the next occupied timeslot occurs. This allows a much weaker pull-up to be used as compared to Example 2. The required resistance must be no larger than:

$R_{max} = (4 * n + 1) / (2 * f_{bc} * C)$ where:

- n is the number of bits per timeslot
- f_{bc} is the frequency of the bitclock
- C is the total system capacitance (ICs, board traces, and so on)

The figure below shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI and Port 3 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data line from Port 3 at the pad is pulled high by a pull-up resistor when they are in the high-impedance state. The data line from Port 3 at the AUDMUX is a pure digital signal and is constantly driven. The combined TXD line, which is the logical AND of the SSI and Port 3's TXD lines, is used for Port 5's RXD line.

Note the highlighted area in the [Figure 16-9](#). This shows the transition time that occurs while Port 3's TXD line is being pulled high. In this example, this transition time is a maximum of two timeslots plus 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis must be enabled at Port 3's RXD pad to prevent the digital signal created by the pad from toggling rapidly during the extended pull-up period. The pads typically require a transition within 25 ns unless hysteresis is enabled.

Figure 16-9. Example Using External Ports For Transmit Data In Nonconsecutive Timeslots

16.5.1.1.3 Transmit Data Output Enable Assertion

The TXD line from the internal network mode master (connected at any internal port) is put into the high-impedance state at the pad depending upon the assertion or deassertion of TxD_obe, its corresponding output enable generated by the network mode master.

In the case of an external network mode master (connected at an external port), the corresponding TxD_obe is always asserted after the port data register configuration.

16.5.1.2 Tx/Rx Switch and External Network Mode

External network mode is the traditional network mode connection. It is called external network mode to differentiate from the internal network mode. In external network mode, devices are connected to a single external port in a star or multi-drop configuration.

In network mode, there can be only one master (driving the frame sync and clock source) with the other devices configured in normal slave mode or network slave mode. Unlike internal network mode, both master-slave and slave-slave communication can take place in external network mode. Codec devices transmit on a single timeslot while processor serial interfaces (that is, SSI) can process more than one timeslot of data while in network master or slave mode.

The following figure shows the Tx/Rx data switch. `RxD_obe` is the output buffer enable signal and `RxD_out` is the data transmit signal from the serial interface. The `TxD_in` signal is the receive data signal going towards the `RXDSEL` muxes of all ports.

`D_TxRx` is the data pin which serves as the chip-level transmit data pin when the TxRx switch is not enabled. `D_RxTx` is the data pin which serves as the chip-level receive data pin when the TxRx switch is not enabled. The roles of these pins are reversed when the TxRx switch is enabled.

When `TXRXEN` is disabled (`TXRXEN=0`), `RxD_out` is routed to `D_TxRx` and `D_RxTx` is routed to `TxD_in`. The output buffer enable, selected by `RXDSEL[2:0]`, is routed to `Db_obe`.

When the Tx/Rx switch is enabled (`TXRXEN=1`), `RxD_out` is routed to `D_RxTx` and `D_TxRx` is routed to `TxD_in`. The output buffer enable, selected by `RXDSEL[2:0]`, is routed to `Da_obe`.

If the `RXDSELn[2:0]` field for any Port *n* is configured to select data from an internal port, the output buffer enable is selected by `RXDSELn[2:0]` and is routed to `Dan_obe/Dbn_obe`. In the case when the `RXDSELn[2:0]` field for Port *n* is configured to select data from an external port, the output buffer enable is always high and routed to `Dan_obe/Dbn_obe`, depending on the `TXRXENn` switch configuration.

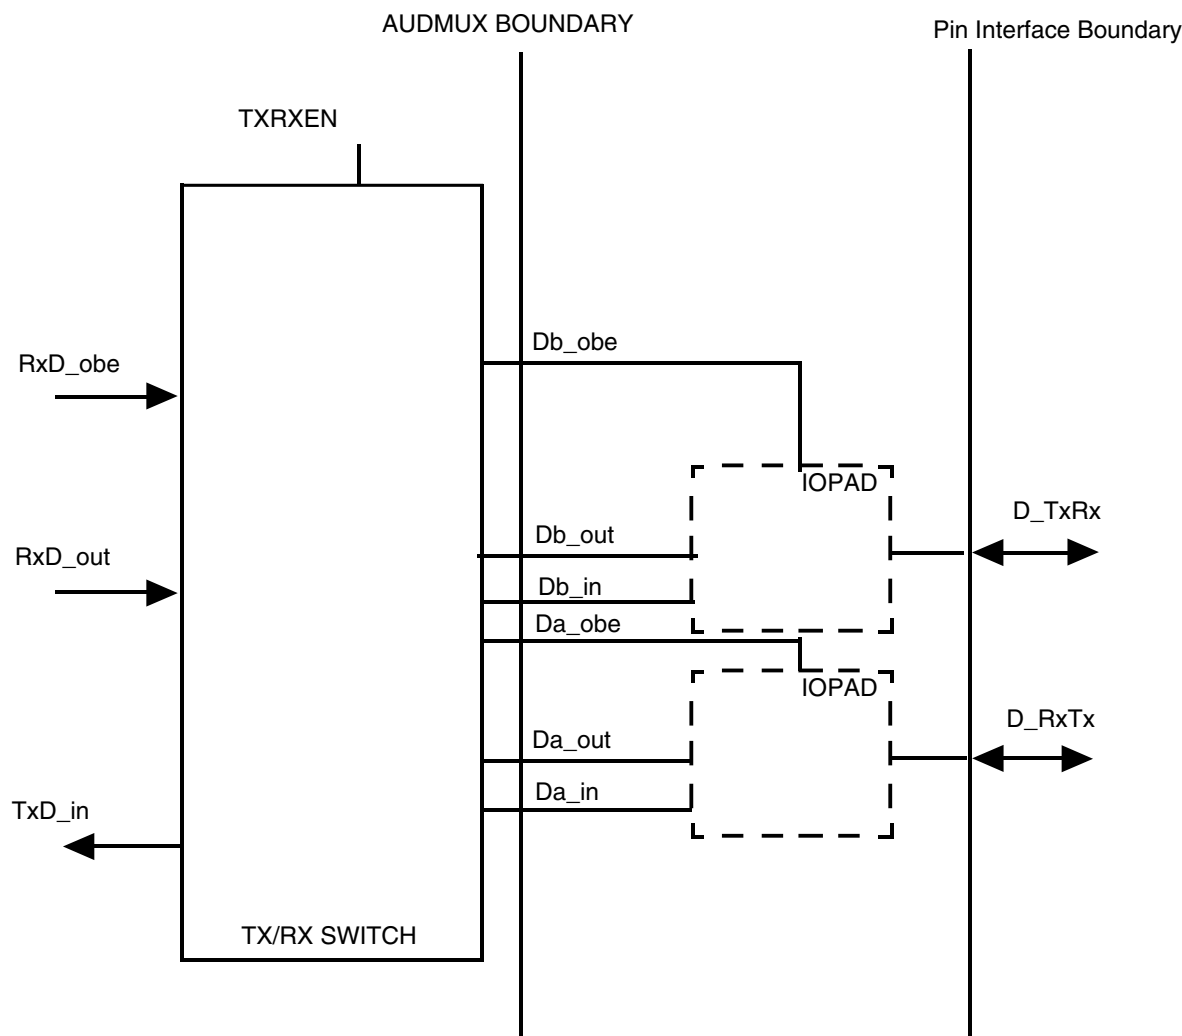

Figure 16-10. Tx/Rx Switch

16.5.1.3 Timing Modes

The AUDMUX ports are constructed as 6-wire interfaces. However, they can be used either in synchronous or asynchronous modes as determined by the SYN bit.

16.5.1.3.1 Synchronous Mode (4-Wire Interface)

In Synchronous mode, each port set in SYN=1 will be a 4-wire interface (that is, RXD, TXD, TXC, TXFS). In this setup, receive data timing is determined by TXC and TXFS..

As shown in the following figure, SSI signals interfaced to Port x signals are routed to Port y. When $SYN = 1$ the 6-wire signal from SSI is reduced to 4-wire within the internal logic.

TFS_in, RFS_in, TCLK_in, and RCLK_in are the input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (_obe). TFS_out, RFS_out, TCLK_out, and RCLK_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

The TFS_out and TCLK_out are selected at Port x by the TFSEL and TCSEL mux settings, respectively. RFS_out and RCLK_out are selected at Port x by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, Port y is configured as a 4-wire port; TFSEL selects the FS_obe and FS_out signals. In this mode, the configuration of RFSEL and RCSEL is not used, since the RFS_out and RCLK_out pins at Port y are not available.

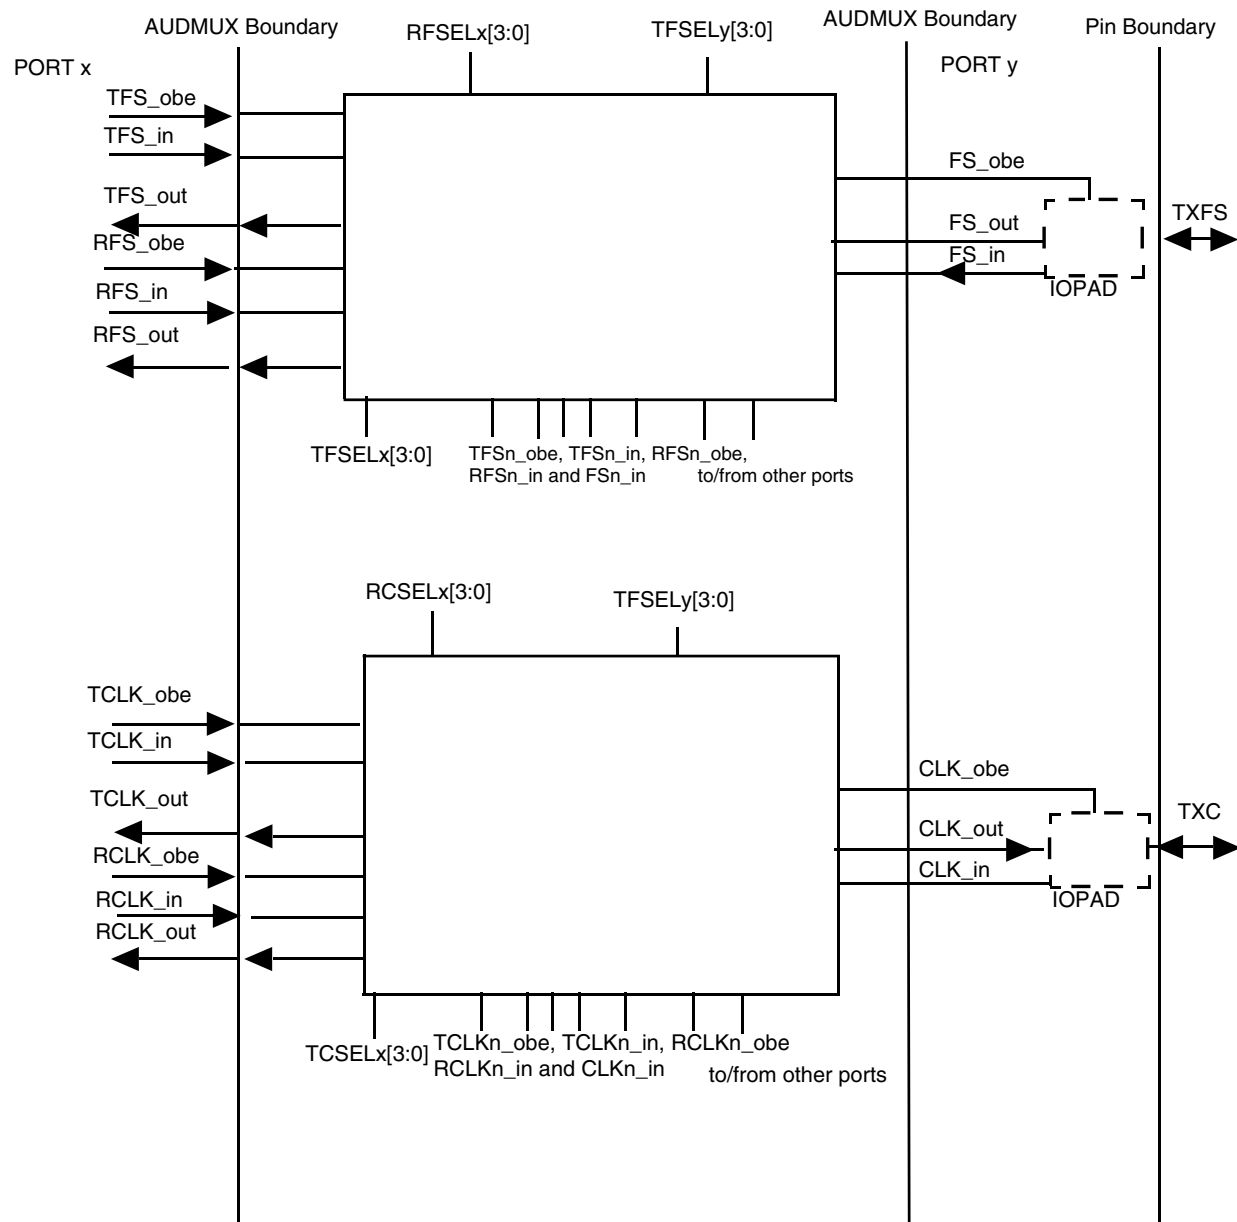

Figure 16-11. Frame Sync and Clock Routing When External Port Is 4-Wire

16.5.1.3.2 Asynchronous Mode (6-Wire Interface)

In Asynchronous mode, the port has a 6-wire interface (meaning RXD, TXD, TXC, TXFS, RXC, RXFS). This mode has additional receive clock (RXC) and frame sync (RXFS) signals as compared to the synchronous or 4-wire interface.

As shown in the figures below, Port x signals can be routed to Port y, producing 6-wire to 6-wire port connectivity.

TFS_in, RFS_in, TCLK_in, and RCLK_in are input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (_obe). TFS_out, RFS_out, TCLK_out, and RCLK_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

TFS_out and TCLK_out are selected by the TFSEL and TCSEL mux settings, respectively. RFS_out and RCLK_out are selected by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, the TFSEL selects the TxFS_obe and TxFS_out signals and TCSEL selects the TxCLK_obe and TxClk_out signals. The RFSEL selects the RxFS_obe and RxFS_out signals and RCSEL selects the RxCLK_obe and RxCLK_out signals.

NOTE

Because FS_in and CLK_in from external interfaces are also routed to the TFSEL and TCSEL muxes of the external ports, these signals do not have corresponding buffer enable signals. Consequently, their corresponding inputs to the TFSEL and TCSEL mux of the external ports have to be tied high.

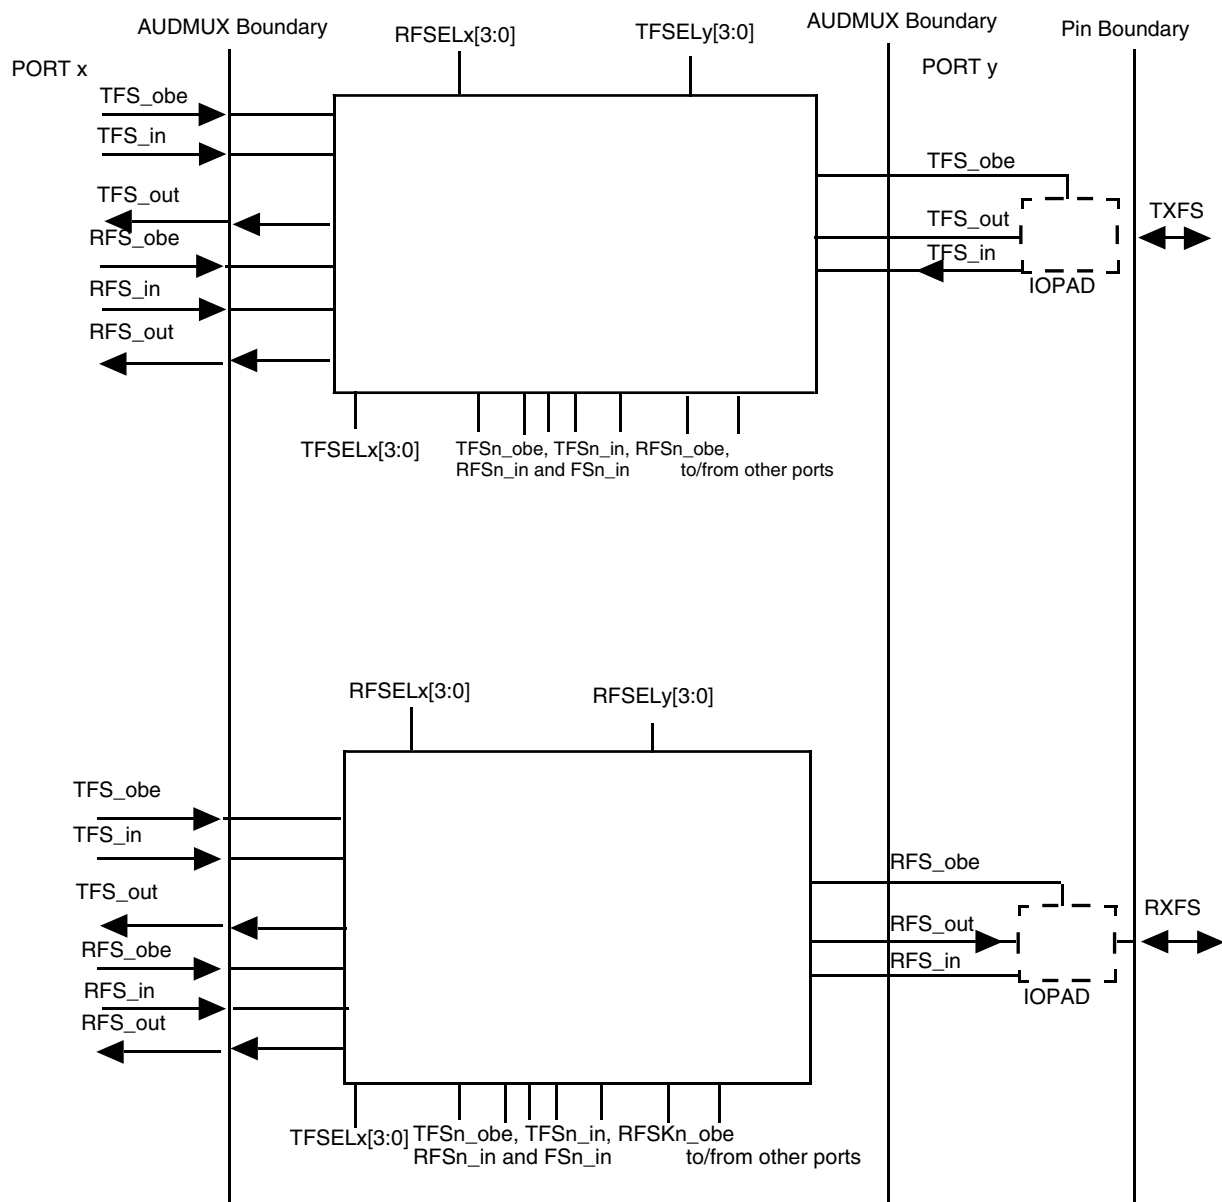

Figure 16-12. Frame Sync Routing When External Port Is 6-Wire

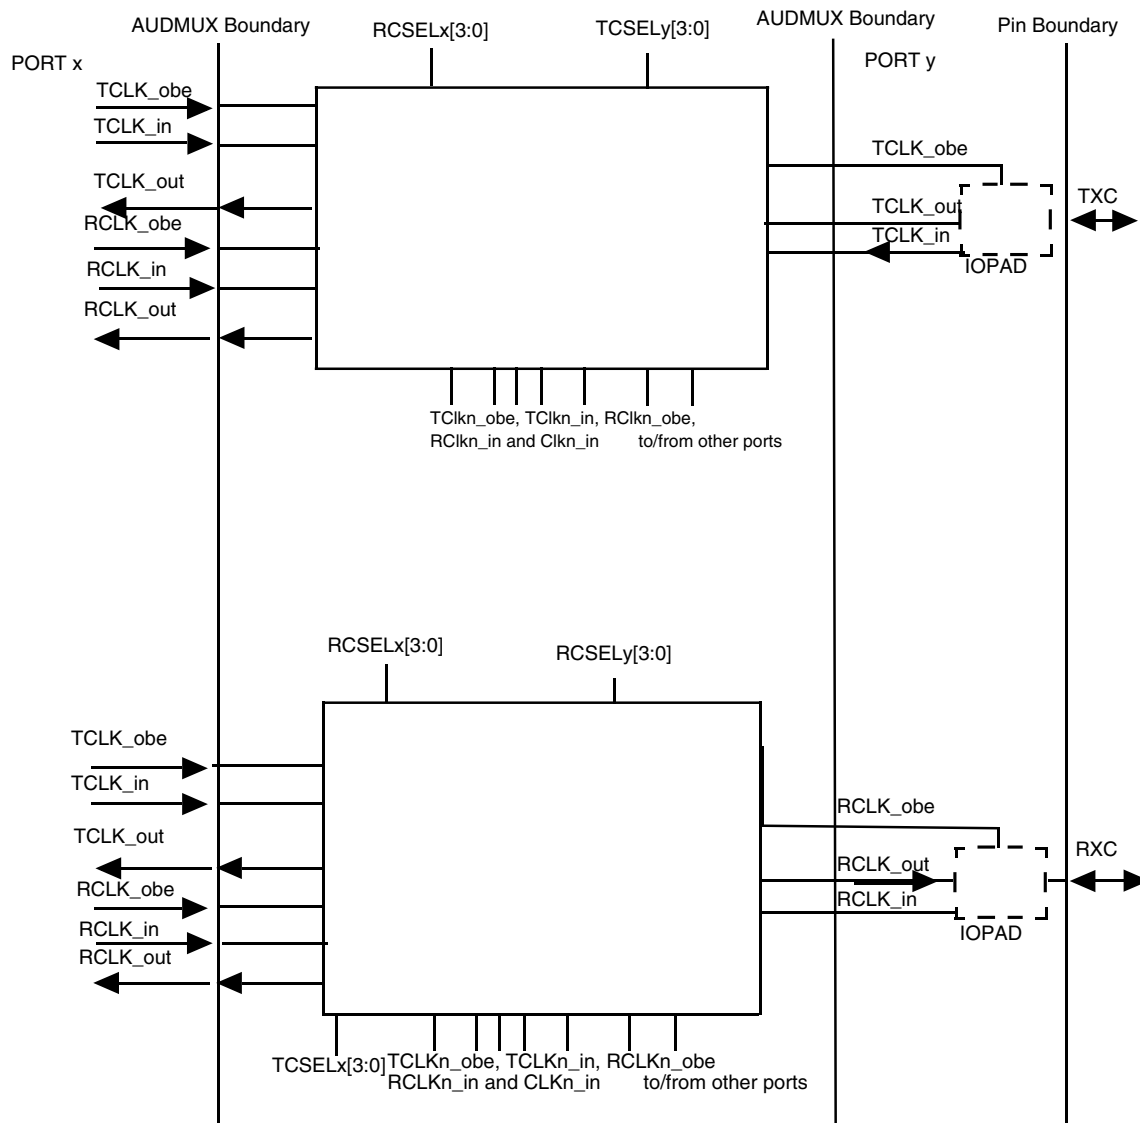

Figure 16-13. Clock Routing When External Port Is 6 Wire

16.5.2 Connectivity Between Ports

Four basic types of connections are provided by the AUDMUX:

- Internal port to external port
- External port to external port
- Internal port to internal port
- Loopback

The corresponding data connections are described in the following sections.

16.5.2.1 Internal Port to External Port Connectivity

The internal port is connected to a processor's serial interface. TxD_obe is the buffer enable signal from the serial interface, TxD_in is the input transmit data from the serial interface to the AUDMUX, and RxD_out is the receive data output from the AUDMUX to the serial interface.

RXDSEL[2:0] of the external port selects the buffer enable signal (TxD_obe) and transmit data output (TxD_out) signal from the TxD_obe and RxD_in signals. RXDSEL[2:0] is a common signal to both selection muxes.

NOTE

Because buffer TxD_in signals from external interfaces do not have corresponding buffer enable signals, their buffer enable signals into the selection mux are tied high. This will ensure that selection of TxD_in, as RxD_out will also drive the RxD_obe output high.

Transmit Data from the serial interface goes into the RXDSEL data mux and comes out as RxD_out. RxD_out is routed to Da_TxRx when TXRXEN is disabled and to D_RxTx when TXRXEN is enabled. Similarly, D_RxTx is routed to TxD_in when TXRXEN is disabled and D_TxRx is routed to TxD_in when TXRXEN is enabled. The routing of frame syncs is shown in [Figure 16-12](#) and the routing of interface clocks is shown in [Figure 16-10](#).

If internal network mode is disabled, then RXDSEL selects the TxD_in, which is sent from the AUDMUX to the serial interface connected at Port x. When the internal network mode is selected, RxD_out is constructed by ANDing selected TxD_in signals from the ports (as determined by INMMASK).

If there is more than one device attached to the external port at D_TxRx and D_RxTx and one of the devices is a network master, then two conditions must be noted:

1. When the external master is enabled in network mode, then the serial interface at Port x must be configured as a slave (normal or network mode). No Tx/Rx switching is required.
2. When the external master is disabled and the serial interface at Port x and other slave devices must communicate, then the serial interface at Port x must be configured as a network mode master and the Tx/Rx switch at Port y must be enabled (TXRXEN=1). This will ensure that the transmit and receive paths are connected appropriately.

To communicate with more than one port, internal network mode can be enabled at Port x. In internal network mode, it is possible to communicate with any device attached to the other ports. Internal network mode shall be enabled at the port that is the SSI network mode master.

16.5.2.2 External Port to External Port Connectivity

External ports can communicate with external ports directly.

External ports can communicate together in three ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. Since an external port is being used as the internal network mode master, all other devices on the same AUDMUX port as the internal network mode master must be disabled. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

16.5.2.3 Internal Port to Internal Port Connectivity

Internal ports can communicate with other internal ports directly, thereby providing a means for synchronous interprocessor communication.

Internal ports can communicate together in two ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

16.5.2.4 Loopback Connectivity

AUDMUX ports can communicate with themselves in order to provide loopback functionality. Port x can route its TXD signal to its own RxD_out signal by setting RXDSELx[2:0] to its own port number. This is supported by all ports in the AUDMUX.

In addition, ports can provide loopback support in internal network mode. With internal network mode, the internal network mode master can loop its TXD signal (combined with those of other ports, if desired) back into its RxD_out signal. Port x's INMMASK should be set such that bit (x - 1) is clear in order to enable the loopback.

16.6 AUDMUX Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a specific sub-block instantiation, see the system memory map in this manual.

The AUDMUX memory map is shown in the following table.

AUDMUX memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/page |
|------------------------|---|-----------------|--------|-------------|-----------------------------|
| 21D_8000 | Port Timing Control Register 1 (AUDMUX_PTCR1) | 32 | R/W | AD40_0800h | 16.6.1/727 |
| 21D_8004 | Port Data Control Register 1 (AUDMUX_PDCR1) | 32 | R/W | 0000_A000h | 16.6.2/729 |
| 21D_8008 | Port Timing Control Register 2 (AUDMUX_PTCR2) | 32 | R/W | A500_0800h | 16.6.3/730 |
| 21D_800C | Port Data Control Register 2 (AUDMUX_PDCR2) | 32 | R/W | 0000_8000h | 16.6.4/732 |
| 21D_8010 | Port Timing Control Register 3 (AUDMUX_PTCR3) | 32 | R/W | 9CC0_0800h | 16.6.5/733 |
| 21D_8014 | Port Data Control Register 3 (AUDMUX_PDCR3) | 32 | R/W | 0000_6000h | 16.6.6/735 |
| 21D_8018 | Port Timing Control Register 4 (AUDMUX_PTCR4) | 32 | R/W | 0000_0800h | 16.6.7/736 |
| 21D_801C | Port Data Control Register 4 (AUDMUX_PDCR4) | 32 | R/W | 0000_4000h | 16.6.8/738 |
| 21D_8020 | Port Timing Control Register 5 (AUDMUX_PTCR5) | 32 | R/W | 0000_0800h | 16.6.9/739 |
| 21D_8024 | Port Data Control Register 5 (AUDMUX_PDCR5) | 32 | R/W | 0000_2000h | 16.6.10/741 |
| 21D_8028 | Port Timing Control Register 6 (AUDMUX_PTCR6) | 32 | R/W | 0000_0800h | 16.6.11/742 |
| 21D_802C | Port Data Control Register 6 (AUDMUX_PDCR6) | 32 | R/W | 0000_0000h | 16.6.12/744 |
| 21D_8030 | Port Timing Control Register 7 (AUDMUX_PTCR7) | 32 | R/W | 0000_0800h | 16.6.13/745 |

AUDMUX_PTCR1 field descriptions

| Field | Description |
|---------------------|--|
| 31 TFS_DIR | Transmit Frame Sync Direction Control. This bit sets the direction of the TXFS pin of the interface as an output or input. When set as an input, the TFSEL settings are ignored. When set as an output, the TFSEL settings determine the source port of the frame sync. 0 TXFS is an input. 1 TXFS is an output. |
| 30–27 TFSEL[3:0] | Transmit Frame Sync Select. Selects the source port from which TXFS is sourced. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved |
| 26 TCLKDIR | Transmit Clock Direction Control. This bit sets the direction of the TXC pin of the interface as an output or input. When set as an input, the TCSEL settings are ignored. When set as an output, the TCSEL settings determine the source port of the clock. |

Table continues on the next page...

AUDMUX_PTCR1 field descriptions (continued)

| Field | Description |
|---------------------|---|
| | 0 TXC is an input. 1 TXC is an output. |
| 25–22 TCSEL[3:0] | Transmit Clock Select. Selects the source port from which TXC is sourced. 0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved |
| 21 RFS_DIR | Receive Frame Sync Direction Control. This bit sets the direction of the RXFS pin of the interface as an output or input. When set as an input, the RFSEL settings are ignored. When set as an output, the RFSEL settings determine the source port of the frame sync. 0 RXFS is an input. 1 RXFS is an output. |
| 20–17 RFSEL[3:0] | Receive Frame Sync Select. Selects the source port from which RXFS is sourced. RXFS can be sourced from TXFS and RXFS from other ports. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved |
| 16 RCLKDIR | Receive Clock Direction Control. This bit sets the direction of the RXC pin of the interface as an output or input. When set as an input, the RCSEL settings are ignored. When set as an output, the RCSEL settings determine the source port of the clock. NOTE: RCLKDIR and SYN should not be changed at the same time. 0 RXC is an input. 1 RXC is an output. |
| 15–12 RCSEL[3:0] | Receive Clock Select. Selects the source port from which RXC is sourced. RXC can be sourced from TXC and RXC from other ports. 0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved |
| 11 SYN | Synchronous/Asynchronous Select. When SYN is set, synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals (that is, the port is a 4-wire interface). When SYN is cleared, asynchronous mode is chosen and separate clock and frame sync signals are used for the transmit and receive sections (that is, the port is a 6-wire interface). NOTE: RCLKDIR and SYN should not be changed at the same time. 0 Asynchronous mode 1 Synchronous mode (default) |
| 10–0 Reserved | This read-only field is reserved and always has the value 0. |

16.6.2 Port Data Control Register 1 (AUDMUX_PDCR1)

PDCR1 is the Port Data Control Register for Port 1.

Address: 21D_8000h base + 4h offset = 21D_8004h

| | | | | | | | | | | | | | | | | |
|-------|-------------|----|----|--------|----|----|----|------|--------------|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Chapter 17

40BIT Correcting ECC Accelerator (BCH)

17.1 Overview

The hardware ECC accelerator provides a forward error-correction function for improving the reliability of various storage media that may be attached to the device.

For example, NAND flash devices use a spare area to store ecc codes to correct some hard bit errors in data stored within the device, allowing higher device yields and, therefore, lower NAND device costs.

The Bose, Ray-Chaudhuri, Hocquenghem (BCH) Encoder and Decoder module is capable of correcting from 2 to 40 single bit errors within a block of data no larger than about 1900 bytes (512 bytes or 1024 bytes are typical) in applications such as protecting data and resources stored on modern NAND flash devices. The correction level in the BCH block is programmable to provide flexibility for varying applications and configurations of flash page size. The design can be programmed to encode protection of 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38 or 40 bit errors when writing flash and to correct the corresponding number of errors on decode. The correction level when decoding **MUST** be programmed to the same correction level as was used during the encode phase.

BCH-codes are a type of block-code, which implies that all error-correction is performed over a block of N-symbols. The BCH operation will be performed over $GF(2^{13} = 8192)$ or $GF(2^{14} = 16384)$, which is the Galois Field consisting of 8191 or 16383 one-bit symbols. BCH-encoding (or encode for any block-code) can be performed by two algorithms: systematic encoding or multiplicative encoding. Systematic encoding is the process of reading all the symbols which constitute a block, dividing continuously these symbols by the generator polynomial for the $GF(8192)$ or $GF(16384)$ and appending the resulting t parity symbols to the block to create a BCH codeword (where t is the number of correctable bits).

The BCH encode process creates $t \times 13$ (or $t \times 14$)-bit parity symbols for each data block when the data is written to the flash device. The parity symbols are written to the flash device after the corresponding data block, and together these are collectively called the codeword. The codeword can be used during the decode process to correct errors that occur in either the data or parity blocks.

The BCH decoder processes code words in a 4-step fashion:

1. Syndrome Calculation (SC): This is the process of reading in all of the symbols of the codeword and continuously dividing by the generator polynomial for the field. $2 \times t$ syndromes must be calculated for each codeword and inspection of the syndromes determines if there are errors: a non-zero set of syndromes indicates one or more errors. This process is implemented parallel hardware to minimize processing time since it must be done every time the decode is performed.
2. Key Equation Solver (KES): The syndromes represent $2t$ -linear equations with $2t$ -unknown variables. The process of solving these equations and selecting from the numerous solutions constitutes the KES module. When the KES block completes its operations, it generates an error locator polynomial (σ) that is used in the proceeding block to determine the locations and values of the errors.
3. Chien Search (CS): This block takes input from the KES block and uses the Chien Algorithm for finding the locations of the errors based on the error locator polynomial. The method basically involves substituting all 8191 symbols from the GF(8192) or 16383 symbols from the GF(16383) into the locator polynomial. All evaluations that produce a zero solution indicate locations of the various errors. Since each located error corresponds to a single bit, the bit in the original data may be corrected by simply flipping the polarity of the incorrect location.
4. Correction: this block has to convert the symbol index and mask information to memory byte indexes and masks.

The BCH block, shown in the figure, was designed to operate in a pipelined fashion to maximize throughput. Aside from the initial latency to fill the pipeline stages, the BCH throughput is about 7/4 cycles/byte. Thus, the bottleneck in performing NAND reads and error corrections is the BCH rate. Current GPMI read rates are approximately 1/2 cycles/byte maximally for the current generation of NAND flash. Fortunately, BCH has a different master clock from GPMI, this gives some flexibility to match the throughput rate. The CPU is not directly involved in generating parity symbols, checking for errors, or correcting them.

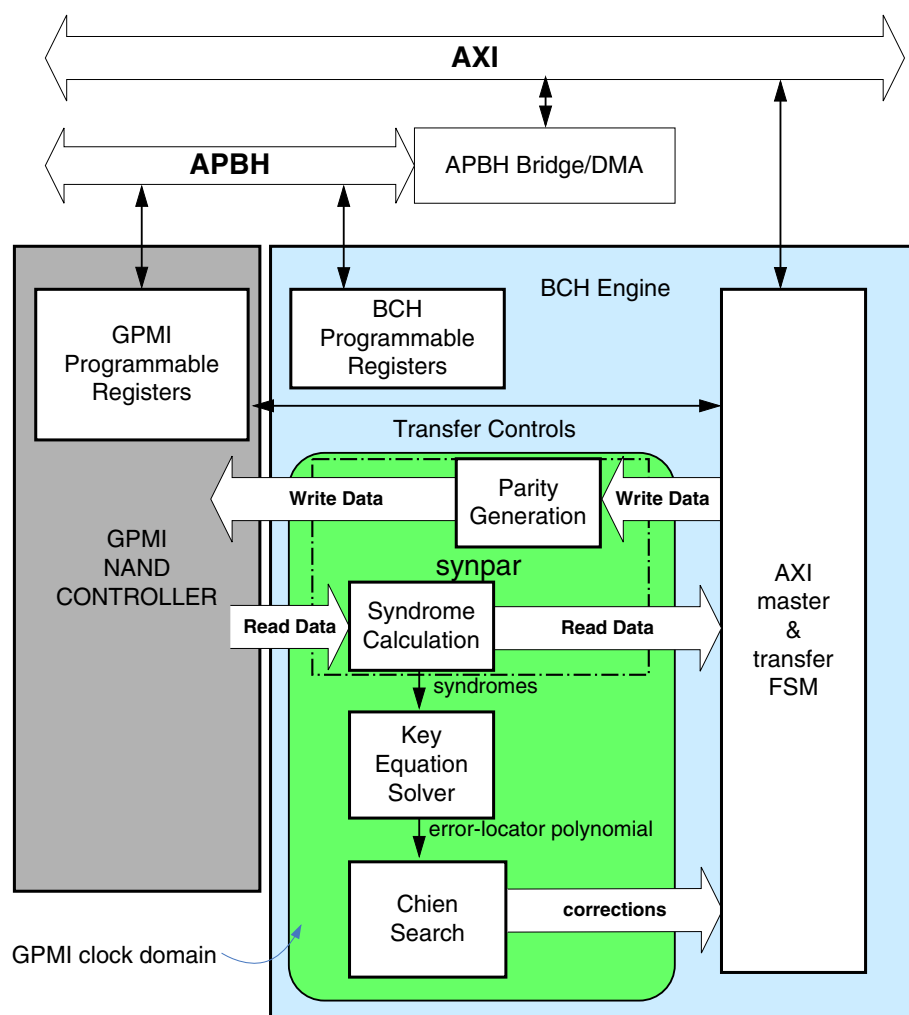

Figure 17-1. Hardware BCH Accelerator

17.2 Operation

Before performing any NAND flash read or write operations, software should first program the BCH's flash layout registers (see [Flash Page Layout](#)) to specify how data is to be formatted on the flash device.

The BCH hardware allows full programmability over the flash page layout to enable users flexibility in balancing ECC correction levels and ever-changing flash page sizes.

To initiate a NAND Flash write, software will program a GPMI DMA operation. The DMA need only program the GPMI control registers (and handle the requisite flash addressing handshakes) since the BCH will handle all data operations using its AXI bus interface. The BCH will then send the data to the GPMI controller to be written to flash

as it computes the parity symbols. At the end of each data block the BCH will insert the parity symbols into the data stream so that the GPMI sees only a continuous stream of data to be written.

NAND Flash read operations operate in a similar manner. As the GPMI controller reads the device, all data is sent to the BCH hardware for error detection/correction. The BCH controller writes all incoming read data to system memory and in parallel computes the syndromes used to detect bit errors. If errors are detected within a block, the BCH hardware activates the error correction logic to determine where bit errors have occurred and ultimately correct them in the data buffer in system memory. After an entire flash page has been read and corrected, the BCH will signal an interrupt to the CPU.

The figure below indicates how data read from the GPMI is operated on within the BCH hardware. As the BCH receives data from the GPMI (top row), it is written to memory by the BCH's Bus Interface Unit (BIU) (second row). For blocks requiring correction, the KES logic will be activated after the entire block has been received. Once the error locator polynomial has been computed, the corrections are determined by the Chien Search and fed back to the BIU, which performs a read, modify, write operation on the buffer in memory to correct the data.

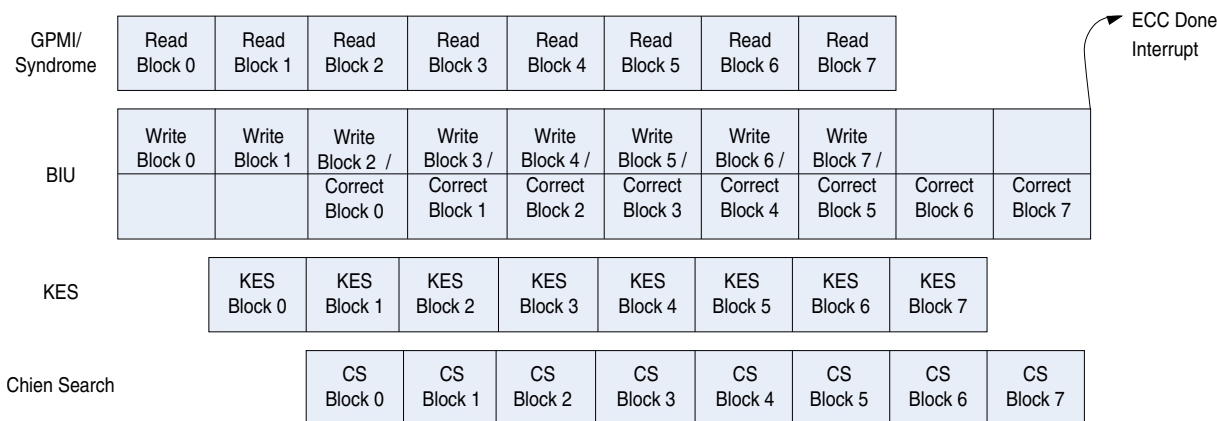

Figure 17-2. Block Pipeline while Reading Flash

17.2.1 BCH Limitations and Assumptions

- The BCH is programmable to support 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, and 40 bit error correction. ECC0 is supported as a pass-through, non-correcting mode.
- Data block sizes must be a multiple of 4 bytes and be aligned in system memory.
- The BCH supports a programmable number of metadata/auxiliary data bytes, from 0 to 255.

- Metadata will be written at the beginning of the flash page to facilitate fast access for filesystem operations.
- Metadata may be treated as an independent block for ECC purposes or combined with the first data block to conserve bits in the flash.
- The BCH does not support a partial page write (this can be accomplished by programming the BCH layout registers such that the BCH only sees a portion of the page).
- Flash read operations can read the entire page or the first block on the page.
- The BCH also supports a memory-to-memory mode of operation that does not require the use of DMA or the GPMI.

17.2.2 Flash Page Layout

The BCH supports a fully programmable flash page layout. The BCH maintains four independent layout registers that can describe four completely different NAND devices or layouts.

When the BCH initiates an operation, it selects one of the layouts by using the chip select as an index into the BCH_LAYOUTSELECT register that determines which layout should be used for the operation.

Three possible (generic) flash layout schemes are supported, as indicated in the figure below. (In each case, the metadata size may also be programmed to 0 bytes). Metadata may either be combined with the first block of data or the size of the first data block can be programmed to 0 to allow the metadata to be protected by its own ECC parity bits.

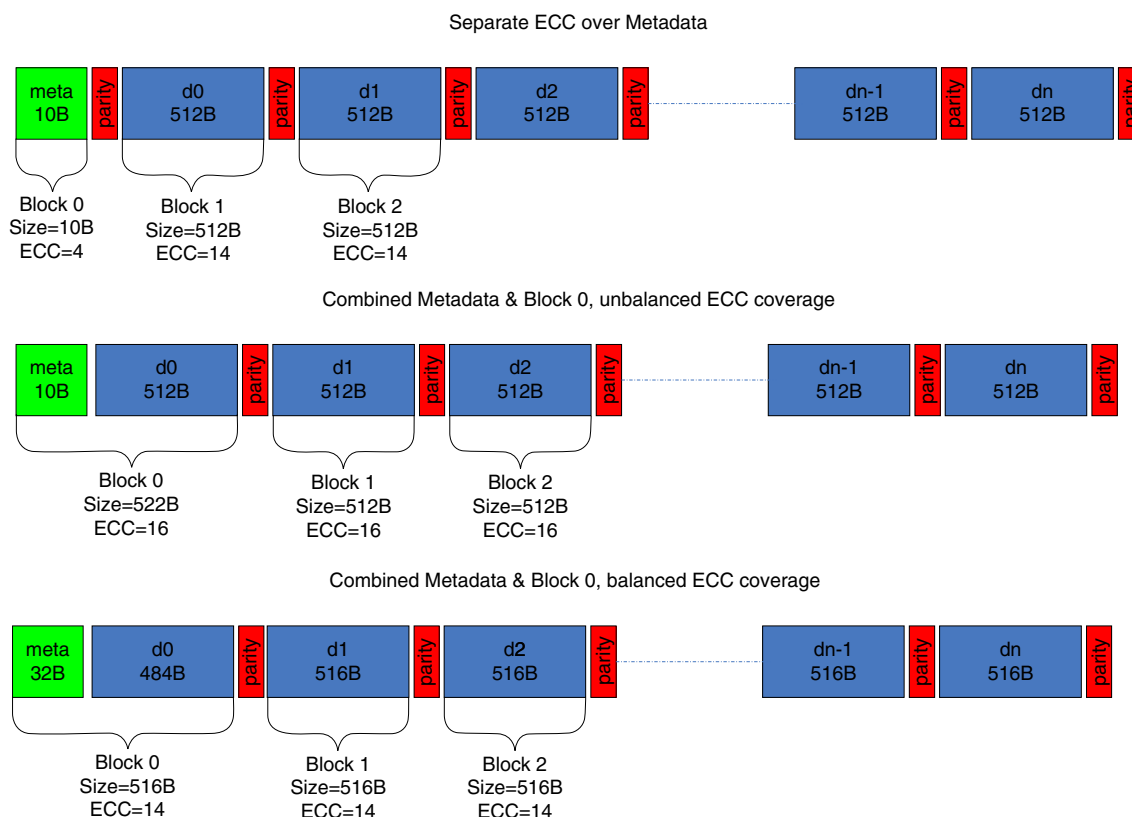

Figure 17-3. FLASH Page Layout Options

Each layout is determined by a pair of registers that define the following parameters:

- **DATA0_SIZE:** Indicates the number of data bytes in the first block on the page (this should not include parity or metadata bytes). This should be set to 0 when the metadata is to be covered separately with its own ECC. This must be a multiple of 4 bytes.
- **ECC0:** Indicates the ECC level to be used for the first block on the flash (data0+metadata).
- **META_SIZE:** Indicates the number of bytes (from 0-255) that are stored as metadata.
- **NBLOCKS:** Indicates the number of subsequent DATAN blocks on the flash, or the number of blocks following the DATA0 block.
- **DATAN_SIZE:** Indicates the number of data bytes in all subsequent data blocks. This **MUST** be a multiple of 4 bytes.
- **ECCN:** Indicates the ECC level to be used for the subsequent data blocks.

- GF0 or GFN: Indicates the Galois field the meta / data blocks are using
- PAGE_SIZE: Indicates the total number of bytes available per page on the physical flash device. This includes the spare area and is typically 4096+128, 4096+218, or 2048+64 bytes.

17.2.3 Determining the ECC layout for a device

Since the BCH is programmable, a system can trade off ECC levels for flash size and layout configurations.

The following examples indicate how to determine a valid layout based on the required storage space and flash size. For all cases, the size of the parity will be 13 (or 14 for GF(2¹⁴))*ECC level *bits*-- so for ECC8, 13 (or 14) bytes are required (per block).

17.2.3.1 4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(2¹³)

In this case, we have 8 data blocks each consisting of 512 bytes. Since the flash has 218 spare bytes (1744 bits), first estimate an ECC level for the data blocks by first subtracting the number of metadata bytes from the spare bytes (218 – 10 = 208 bytes = 1664 bits) then dividing the number of bits by 8 (number of blocks) and then by 13 (bits per ECC level).

$$(218 - 10) \times 8 = 1664 / 13(8) = 16$$

Therefore all the data blocks could be covered by ECC16 if the metadata had no parity. This isn't acceptable, so assume ECC14 for all the data blocks. Now calculate the number of free bits for the metadata parity as

$$1664 - (14) \times 13 \times 8 = 208$$

Therefore, 208 bits remain for metadata parity. Dividing by 13 (bits/ECC) gives 16, so the metadata can be covered with ECC16. The settings for this device would then be

Table 17-1. Settings for 4K+218 FLASH

| Setting | Value |
|------------|----------------------|
| PAGE_SIZE | 4096+218=4314=0x10DA |
| META_SIZE | 10=0x0A |
| DATA0_SIZE | 0 |
| ECC0 | 16=0x10 |

Table continues on the next page...

Table 17-1. Settings for 4K+218 FLASH (continued)

| Setting | Value |
|------------|---|
| GF0 | GF(2 ¹³) |
| DATAN_SIZE | 512=0x200 (in register interface, assigned as 0x80) |
| ECCN | 14=0x0E |
| GFN | GF(2 ¹³) |
| NBLOCKS | 8 |

17.2.3.2 4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(2¹³) for data and GF(2¹⁴) for metadata

This flash will have 118 bytes available for ECC (after subtracting the metadata size), therefore, 994 bits.

Dividing by 4*14 (number of blocks * ECC level) we get 17.75, therefore we can support ECC16 on the data blocks. The number of free spare bits becomes $944 - 16 * 4 * 14 = 944 - 896 = 48$, divided by 13 = 3.69, therefore the metadata can be also covered by ECC2.

Table 17-2. Settings for 4K+128 FLASH

| Setting | Value |
|------------|---|
| PAGE_SIZE | 4096+128=4224=0x1080 |
| META_SIZE | 10=0x0A |
| DATA0_SIZE | 0 |
| ECC0 | 2 |
| GF0 | GF(2 ¹³) |
| DATAN_SIZE | 1024=0x400 (in register interface, assigned as 0x100) |
| ECCN | 16 |
| GFN | GF(2 ¹⁴) |
| NBLOCKS | 4 |

In this case, there will be additional unused spare bits, with the BCH will pad out with zeros.

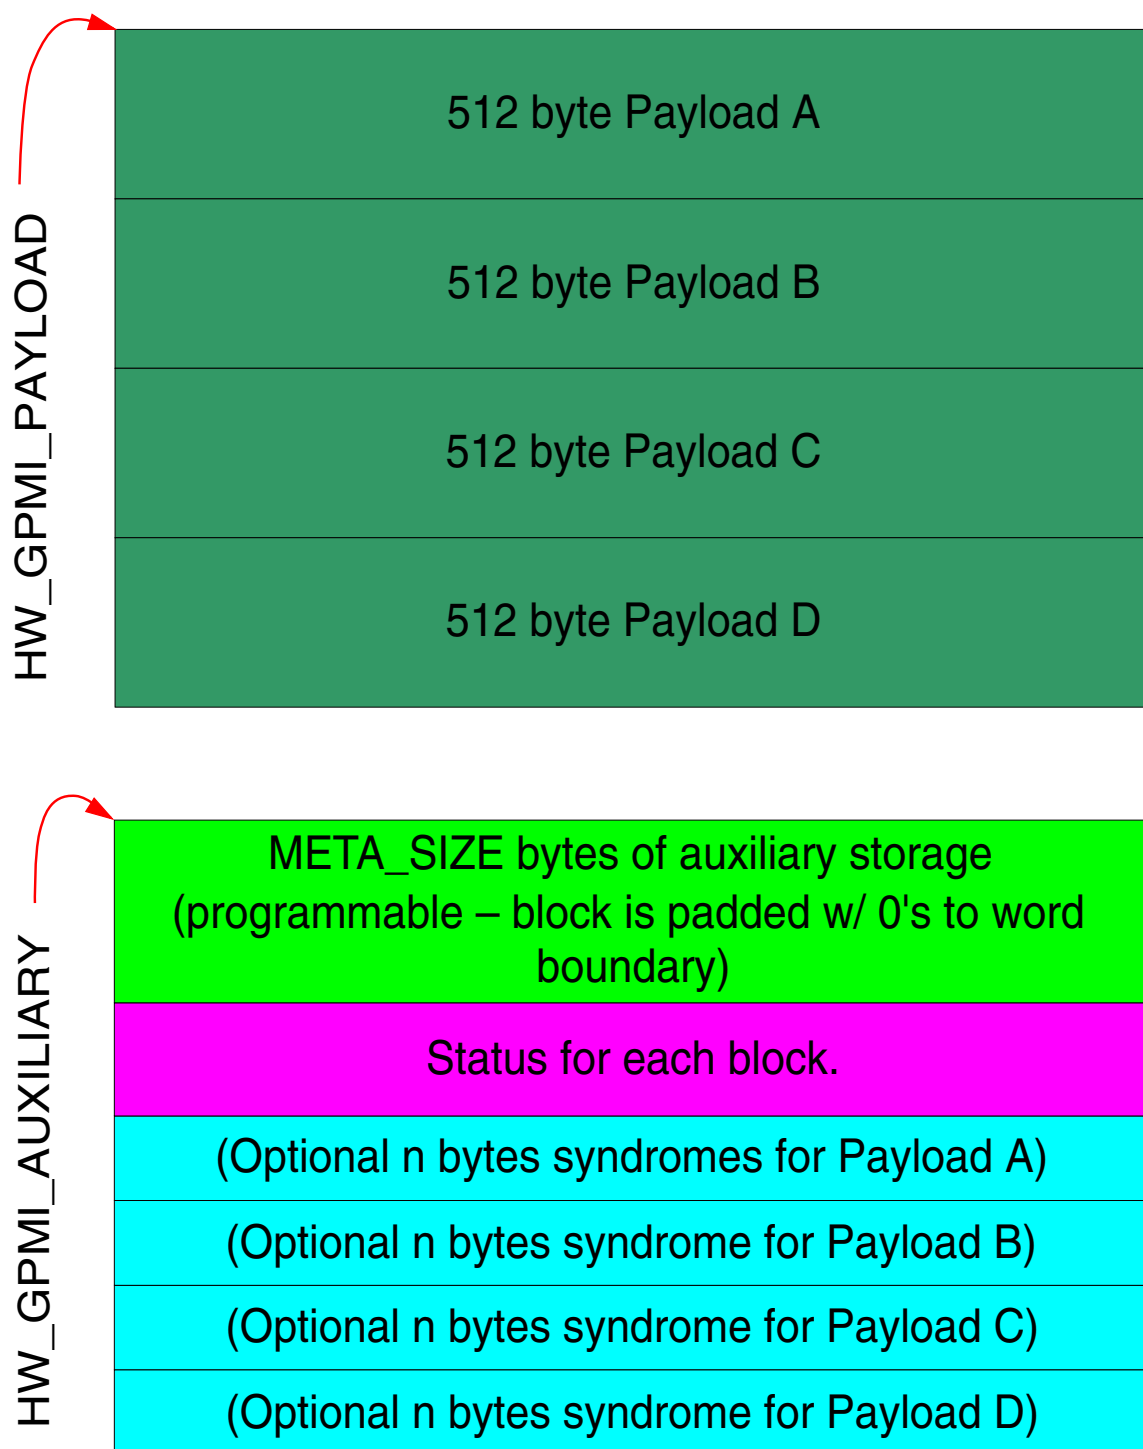

17.2.4 Data Buffers in System Memory

While the data on the flash is interleaved with parity symbols, the BCH assumes that the data buffers in memory are contiguous.

Metadata read from the flash will be stored to the location pointed to by the GPMI_AUXILIARY register and data will be written to the address specified in the GPMI_PAYLOAD register as is shown in the following figure where the block length is 512 bytes for example. Since the number of blocks on a flash page is programmable, the BCH also writes individual block correction status to the auxiliary pointer at the word-aligned address following the end of the metadata. Optionally, the computed syndromes may also be written to the auxiliary area if the DEBUGSYNDROME bit is set in the control register.

As blocks complete processing, the bus master will accumulate the status for each block and write it to the auxiliary data buffer following the metadata. The metadata area will be padded with 0's until the next word boundary and the status for blocks 0-3 will be written to the next word. The status for subsequent blocks will then be written to the buffer. The status for the first block (metadata block) is also stored in the STATUS_BLK0 register in the BCH_STATUS register. The completion codes for the blocks are indicated in the [Table 17-3](#). Note that the definition of the bytes and their ordering in the auxiliary and payload storage areas are user defined. When this data is read back from the flash and put into memory, it will resemble the original buffer that was written out to the flash.

Minimum System Memory Footprint:

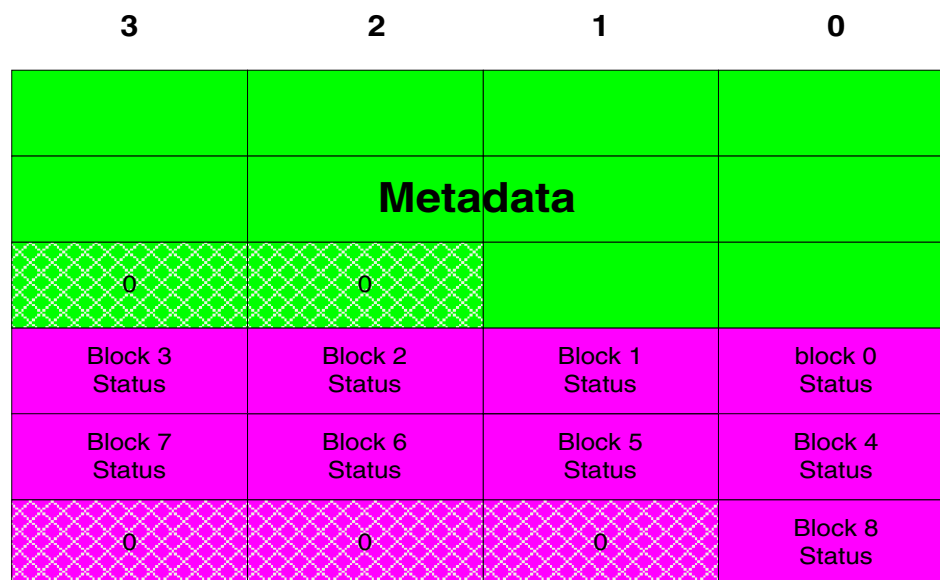

Computed syndrome area consists of $2 \times t$ 13 (or 14)-bit symbols written as 16-bit half word.

Figure 17-4. BCH Data Buffers in Memory

Table 17-3. Status Block Completion Codes

| Code | Description |
|-----------|----------------------------|
| 0xFF | Block is erased |
| 0xFE | Block is uncorrectable |
| 0x00 | No errors found |
| 0x01-0x28 | Number of errors corrected |

The following figure shows the layout of the bytes within the status field.

Status bytes are allocated based on the NBLOCKS programmed into the flash format register. The number of status bytes will be computed by the NBLOCKS+1. The status area will be padded with zeros to the next word boundary.

Syndrome data written for debug purposes will follow the end of the status block.

Figure 17-5. Memory-to-Memory Operations

17.3 Memory to Memory (Loopback) Operation

The BCH supports a memory-to-memory mode of operation where both the encoded and decoded buffers reside in system memory.

This can be useful for applications where data must be protected by ECC, but the storage device does not reside on the GPMI bus.

The BCH operation in memory to memory mode is much simpler than in GPMI mode since DMAs are not required to manage the operation. Instead, software simply writes the BCH_DATAPTR and BCH_METAPTR with the addresses of the data and metadata (auxiliary) buffers and the BCH_ENCODEPTR with the address of the buffer for encoded data. To initiate the operation, software simply sets the M2M_ENCODE and M2M_ENABLE bits in the control register. The BCH can be programmed to either issue an interrupt at the end of the operation or software may poll the status bits for completion.

Memory to memory decode operations work in a similar manner. The encoded data address is written to the BCH_ENCODEPTR and the data and meta pointers are written to buffers that correspond to the desired decoded data addresses. To initiate a decode, software must set the M2M_ENCODE bit to 0 while writing the M2M_ENABLE bit. Note that the addresses written to the BCH_DATAPTR, BCH_METAPTR and BCH_ENCODEPTR registers should always be aligned on a 4 byte boundary. In other words, the 2 lower bits of the address should always be written with zeros.

17.4 Programming the BCH/GPMI Interfaces

Programming the BCH for NAND operations consists largely of disabling the soft reset and clock bits (SFTRST and CLKGATE) from the BCH_CTRL register and then programming the flash layout registers to correspond to the format of the attached NAND device(s).

The BCH_LAYOUTSELECT register should also be programmed to map the chip select of each attached device into one of the four layout registers.

The bulk of the programming is actually applied to the GPMI through PIO operations embedded in DMA command structures. The DMA will perform all the requisite handshaking with the GPMI interface to negotiate the address portion of the transfer, then the BCH will handle all the movement of data from memory to the GPMI (writes) or the GPMI to memory (reads). The BCH will direct all data blocks to the buffer pointed to by the PAYLOAD_BUFFER and the metadata will be written to the AUXILIARY_BUFFER. Both of these registers are located in the GPMI PIO data space and are communicated to the BCH hardware at the beginning of the transfer. Thus, the normal multi-NAND DMA based device interleaving is preserved, that is, four NANDs on four separate chip selects can be scheduled for read or write operations using the BCH. Whichever channel finishes its ready wait first and enters the DMA arbiter with its lock bit set owns the GPMI command interface and through it owns the BCH resources for the duration of its processing.

17.4.1 BCH Encoding for NAND Writes

The BCH encoder flowchart in [Figure 17-6](#) shows the detailed steps involved in programming and using the BCH encoder. This flowchart shows how to use the BCH block with the GPMI.

To use the BCH encoder with the GPMI's DMA, create a DMA command chain containing ten descriptor structures, as shown in [Figure 17-8](#) and detailed in the DMA structure code example that follows it in [DMA Structure Code Example](#). The ten descriptors perform the following tasks:

1. Disable the BCH block (in case it was enabled) and issue NAND write setup command byte (under CLE) and address bytes (under ALE).
2. Configure and enable the BCH and GPMI blocks to perform the NAND write.
3. Disable the BCH block and issue NAND write execute command byte (under CLE).
4. Wait for the NAND device to finish writing the data by watching the ready signal.
5. Check for NAND timeout through PSENSE.
6. Issue NAND status command byte (under CLE).
7. Read the status and compare against expected.
8. If status is incorrect or incomplete, branch to error handling descriptor chain.
9. Otherwise, write is complete and emit GPMI interrupt.

```

17.4.1.2 Using the BCH Encoder

To use the BCH encoder, first turn off the module-wide soft reset bit in both the GPMI and BCH blocks before starting any DMA activity.

Turning off the soft reset must take place by itself, prior to programming the rest of the control registers. Turn off the BCH bus master soft reset bit. Turn off the clock gate bits.

Program the remainder of the GPMI, BCH and APBH DMA as follows:

```

// bring APBH out of reset
APBH_CTRL0_CLR(BM_APBH_CTRL0_SFRST);
APBH_CTRL0_CLR(BM_APBH_CTRL0_CLKGATE);

// bring BCH out of reset
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);

// bring gpmi out of reset
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_SFTRST);
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_CLKGATE);
GPMI_CTRL1_SET(BM_GPMI_CTRL1_DEV_RESET | // deassert reset
               BM_GPMI_CTRL1_BCH_MODE ); // enable BCH mode

// enable pinctrl
PINCTRL_CTRL_WR(0x00000000);

// enable gpmi pins
PINCTRL_MUXSEL0_CLR(0x0000ffff); // data bits
PINCTRL_MUXSEL1_CLR(0x03ffffff); // control bits
PINCTRL_MUXSEL8_CLR(0x0003f3ff); // control bits
PINCTRL_MUXSEL8_SET(0x00015155); // control bits

```

Note that for writing NANDs (ECC encoding), only GPMI DMA command complete interrupts are used. The BCH engine is used for writing to the NAND but may optionally produces an interrupt. From the sample code in [DMA Structure Code Example](#):

- DMA descriptor 1 prepares the NAND for data write by using the GPMI to issue a write setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is disabled and not used for these commands.

- DMA descriptor 2 enables the BCH engine for encoding to begin the initial writing of the NAND data by specifying where the data and auxiliary payload are coming from in system memory.
- DMA descriptor 3 issues the write commit command byte under CLE to the NAND.
- DMA descriptor 4 waits for the NAND to complete the write commit/transfer by watching the NAND's ready line status. This descriptor relinquishes the NANDLOCK on the GPMI to enable the other DMA channels to initiate NAND transactions on different NAND CS lines.
- DMA descriptor 6 issues a NAND status command byte under "CLE" to check the status of the NAND device following the page write.
- DMA descriptor 7 reads back the NAND status and compares the status with an expected value. If there are differences, then the DMA processing engine follows an error-handling DMA descriptor path.
- DMA descriptor 8 disables the BCH engine and emits a GPMI interrupt to indicate that the NAND write has been completed.

17.4.2 BCH Decoding for NAND Reads

When a page is read from NAND flash, BCH syndromes will be computed and, if correctable errors are found, they will be corrected on a per block basis within the NAND page.

This decoding process is fully overlapped with other NAND data reads and with CPU execution. The BCH decoder flowchart in the figure below shows the steps involved in programming the decoder. The hardware flow of reading and decoding a 4096-byte page is shown in [Figure 17-10](#).

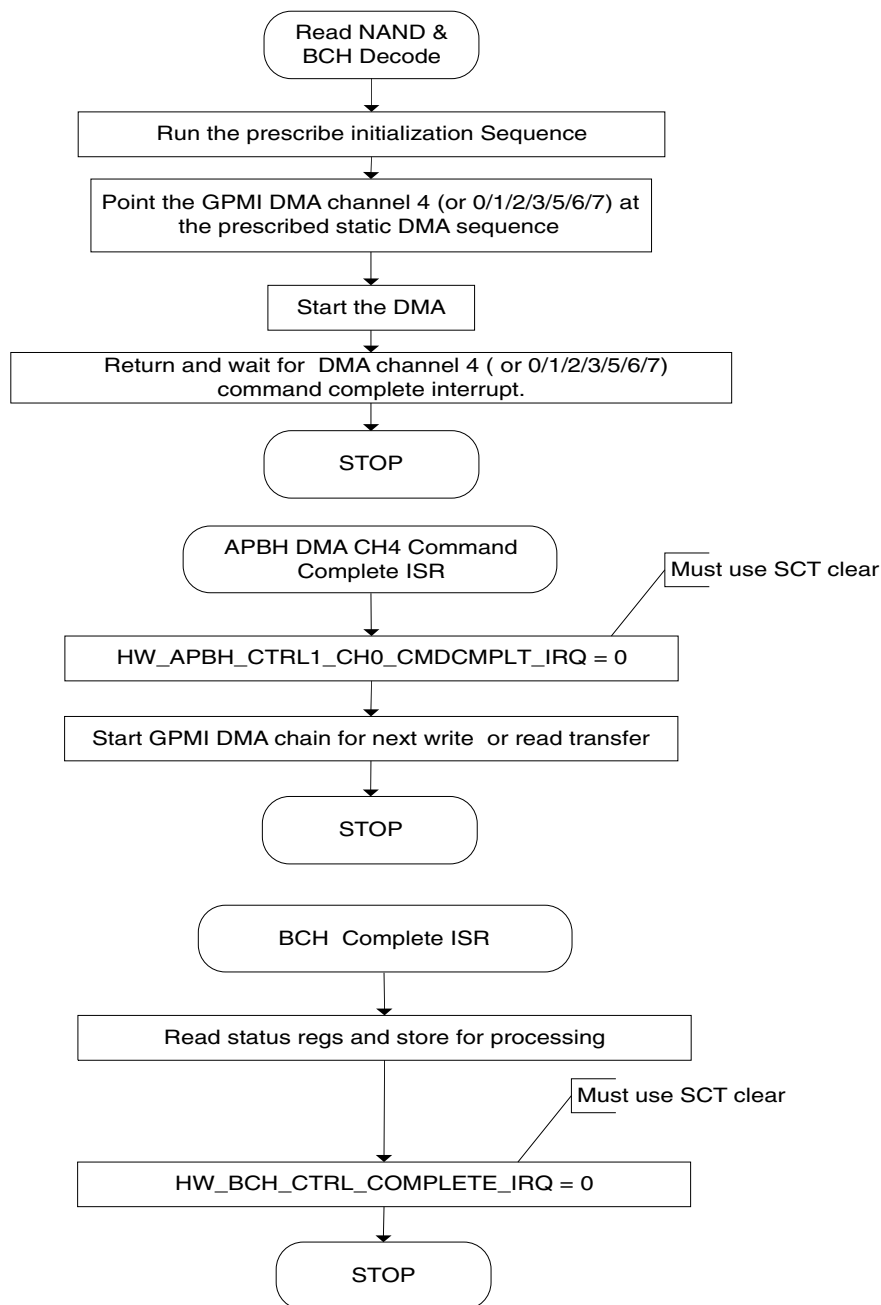

Figure 17-9. BCH Decode Flowchart

Conceptually, an APBH DMA Channel (0,1,2 or 3) command chain with seven command structures linked together is used to perform the BCH decode operation (as shown in [Figure 17-10](#)).

Note

The GPMI's DMA command structures controls the BCH decode operation.

To use the BCH decoder with the GPMI's DMA, create a DMA command chain containing seven descriptor structures, as shown in the figure below and detailed in the DMA structure code example that follows it in [DMA Structure Code Example](#). The seven DMA descriptors perform the following tasks:

1. Issue NAND read setup command byte (under "CLE") and address bytes (under "ALE").
2. Issue NAND read execute command byte (under "CLE").
3. Wait for the NAND device to complete accessing the block data by watching the ready signal.
4. Check for NAND timeout through "PSENSE".
5. Configure and enable the BCH block and read the NAND block data.
6. Disable the BCH block.
7. Descriptor NOP to allow NANDLOCK in the previous descriptor to the thread-safe.

Programming the BCH/GPMI Interfaces

Descriptor 1: Disable BCH engine and issue NAND read set-up command and address (CLE/ALE).

```

17.4.2.2 Using the Decoder

As illustrated in [Figure 17-10](#) and the sample code in [DMA Structure Code Example](#) :

- DMA descriptor 1 prepares the NAND for data read by using the GPMI to issue a NAND read setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is not used for these commands.
- DMA descriptor 2 issues a one-byte read execute command to the NAND device that triggers its read access. The NAND then goes not ready.

- DMA descriptor 3 performs a wait for ready operation allowing the DMA chain to remain dormant until the NAND device completes its read access time.
- DMA descriptor 5 handles the reading and error correction of the NAND data. This command's PIOs activate the BCH engine to write the read NAND data to system memory and to process it for any errors that need to be corrected. This DMA descriptor contains two PIO values that are system memory addresses pointing to the PAYLOAD data area and to the AUXILIARY data area. These addresses are used by the BCH engine's AHB master to move data into system memory and to correct it. While this example is reading an entire 4K page—payload plus metadata—it is equally possible to read just one 512-byte payload block or just the uniquely protected metadata block in a single 7 DMA structure transfer.
- DMA descriptor 6 disables the BCH engine with the NANDLOCK asserted. This is necessary to ensure that the GPMI resource is not arbitrated to another DMA channel when multiple DMA channels are active concurrently.
- DMA descriptor 7 deasserts the NANDLOCK to free up the GPMI resource to another channel.

As the BCH block receives data from the GPMI:

- The decoder transforms the read NAND data block into a BCH code word and computes the codeword syndrome.
- If no errors are present, then the BCH block can immediately report back to firmware. This report is passed as the BCH_CTRL_COMPLETE_IRQ interrupt status bit and the associated status registers in BCH_STATUS0/1 registers.
- If an error is present, then the BCH block corrects the necessary data block or parity block bytes, if possible (not all errors are correctable).

As the BCH decoder reads the data and parity blocks, it records a special condition, i.e., that all of the bits of a payload data block or metadata block are one, including any associated parity bytes. The all-ones case for both parity and data indicates an erased block in the NAND device.

The BCH_STATUS0 register contains a 4-bit field that indicates the final status of the auxiliary block. A value of 0x0 indicates no errors found for a block.

- A value of 1 to 20 inclusive indicates that many correctable errors were found and fixed.
- A value of 0xFE indicates uncorrectable errors detected on the block.

- A value of 0xFF indicates that the block was in the special ALL ONES state and is therefore considered to be an ERASED block.
- All other values are disallowed by the hardware design.

Recall that up to eight NAND devices can have DMA chains in-flight at once, i.e. they can all be contending for access to the GPMI data bus. It is impossible to predict which NAND device will enter the BCH engine with a transfer first, because each chain includes a wait4ready command structure. As a result, firmware should look at the BCH_STATUS0_COMPLETED_CE bit field to determine which block is being reported in the status register. There is also a 16-bit HANDLE field in the GPMI_ECCCTRL register that is passed down the pipeline with each transaction. This handle field can be used to speed firmware's detection of which transaction is being reported.

These examples of reading and writing have focused on full page transfers of 4K page NAND devices. Other device configurations can be specified by changing the ECCOUNT field in the GPMI registers and reprogramming the BCH's FLASHnLAYOUTm registers.

The BCH and GPMI blocks are designed to be very efficient at reading single 512 (or 1024)-byte pages in one transaction. With no errors, the transaction takes less than 20 HCLKs longer than the time to read the raw data from the NAND.

To summarize, the APBH DMA command chain for a BCH decode operation is shown in [Figure 17-10](#). Seven DMA command structures must be present for each NAND read transaction decoded by the BCH. The seven DMA command structures for multiple NAND read transaction blocks can be chained together to make larger units of work for the BCH, and each will produce an appropriate error report in the BCH PIO space. Multiple NAND devices can have such multiple chains scheduled. The results can come back out of order with respect to the multiple chains.

17.4.3 Interrupts

There are two interrupt sources used in processing BCH protected NAND read and write transfers.

Since all BCH operations are initiated by GPMI DMA command structures, the DMA completion interrupt for the GPMI is an important ISR. Both of the flow charts of [Figure 17-6](#) and [Figure 17-9](#) show the GPMI DMA complete ISR skeleton. In both reads and writes, the GPMI DMA completion interrupt is used to schedule work *INTO* the error correction pipeline. As the front end processing completes, the DMA interrupt is

generated and additional work, such as DMA chains, are passed to the GPMI DMA to keep it *fed*. For write operations, this is the only interrupt that is generated for processing the NAND write transfer.

For reads, however, two interrupts are needed. Every read is started by a GPMI DMA command chain and the front end queue is fed as described above. The back end of the read pipeline is drained by monitoring the BCH completion interrupt found in `HW_BCH_CTRL_COMPLETE_IRQ`.

An BCH transaction consists of reading or writing all of the blocks requested in the `HW_GPMI_ECCCTRL_BUFFER_MASK` bit field. As every read transaction completes, it posts the status of all of the blocks to the `HW_BCH_STATUS0` and `HW_BCH_STATUS1` registers and sets the completion interrupt. The five stages of the BCH read pipeline completes, one in the GPMI and four in the BCH, are independently stalled as they complete and try to deliver to the next stage in the data flow. Several of these stages can be skipped if no-errors are found or once an uncorrectable error is found in a block.

In any case, the final stage will stall if the status register is busy waiting for the CPU to take status register results. The hardware monitors the state of the `HW_BCH_CTRL_COMPLETE_IRQ` bit. If it is still set when the last pipeline stage is ready to post data, then the stage will stall. It follows that the next previous stage will stall when it is ready to hand off work to the final stage, and so on up the pipeline.

CAUTION

It is important that firmware read the STATUS0/1 results and save them before clearing the interrupt request bit. Otherwise, a transaction and its results could be completely lost.

17.5 Behavior During Reset

A soft reset (SFTRST) can take multiple clock periods to complete, so do NOT set `CLKGATE` when setting SFTRST.

The reset process gates the clocks automatically. The exemplary code is shown below.

```
// A soft reset can take multiple clocks to complete, so do NOT gate the
// clock when setting soft reset. The reset process will gate the clock
// automatically. Poll until this has happened before subsequently
// preparing soft-reset and clock gate
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);
// asserting soft-reset
BCH_CTRL_SET(BM_BCH_CTRL_SFTRST);
// waiting for confirmation of soft-reset
while (!BCH_CTRL.B.CLKGATE)
```

```

{
// busy wait
}
// Done.
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);

```

17.6 BCH Memory Map/Register Definition

BCH Hardware Register Format Summary

BCH memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|--|-----------------|--------|-------------|-----------------------------|
| 11_4000 | Hardware BCH ECC Accelerator Control Register (BCH_CTRL) | 32 | R/W | C000_0000h | 17.6.1/781 |

17.6.1 Hardware BCH ECC Accelerator Control Register (BCH_CTRL)

The BCH CTRL provides overall control of the hardware ECC accelerator

Address: 11_4000h base + 0h offset = 11_4000h

BCH Memory Map/Register Definition

BCH_CTRL field descriptions

| Field | Description |
|---------------------|---|
| 31 SFTRST | Set this bit to zero to enable normal BCH operation. Set this bit to one (default) to disable clocking with the BCH and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the BCH block to its default state. This bit resets all state machines except for the AHB master state machine 0x0 RUN — Allow BCH to operate normally. 0x1 RESET — Hold BCH in reset. |
| 30 CLKGATE | This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block. 0x0 RUN — Allow BCH to operate normally. 0x1 NO_CLKS — Do not clock BCH gates in order to minimize power consumption. |
| 29–23 RSVD5 | Reserved, always set this bit to zero. |
| 22 DEBUGSYNDROME | (For debug purposes only). Enable write of computed syndromes to memory on BCH decode operations. Computed syndromes will be written to the auxiliary buffer after the status block. Syndromes will be written as padded 16-bit values. |
| 21–20 RSVD4 | Reserved, always set these bits to zero. |
| 19–18 M2M_LAYOUT | Selects the flash page format for memory-to-memory operations. |
| 17 M2M_ENCODE | Selects encode (parity generation) or decode (correction) mode for memory-to-memory operations. |
| 16 M2M_ENABLE | NOTE! WRITING THIS BIT INITIATES A MEMORY-TO-MEMORY OPERATION. The BCH module must be inactive (not processing data from the GPMI) when this bit is set. The M2M_ENCODE and M2M_LAYOUT bits as well as the ENCODEPTR, DATAPTR, and METAPTR registers are used for memory-to-memory operations and must be correctly programmed before writing this bit. |

Table continues on the next page...

BCH_CTRL field descriptions (continued)

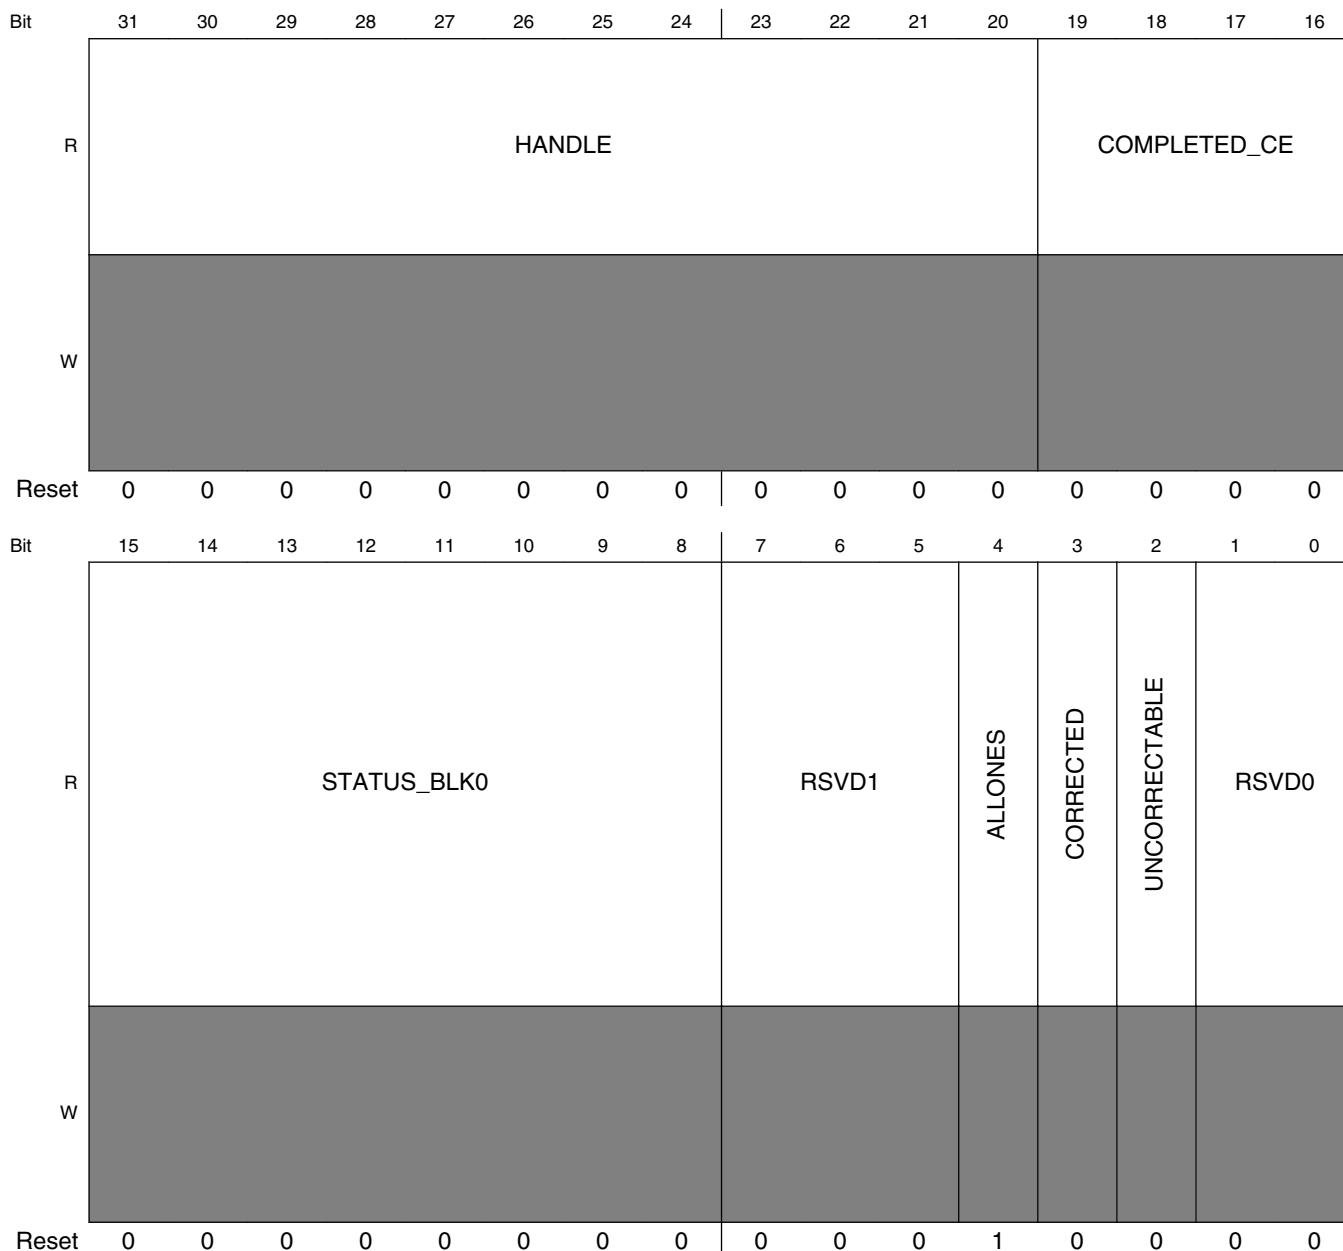

| Field | Description |
|------------------------------|--|
| 15–11 RSVD3 | Reserved, always set these bits to zero. |
| 10 DEBUG_STALL_ IRQ_EN | 1 = interrupt on debug stall mode is enabled. The irq is raised on every block |
| 9 RSVD2 | Reserved, always set these bits to zero. |
| 8 COMPLETE_IRQ_ EN | 1 = interrupt on completion of correction is enabled. |
| 7–4 RSVD1 | Reserved, always set these bits to zero. |
| 3 BM_ERROR_IRQ | AHB Bus interface Error Interrupt Status. Write a one to the SCT clear address to clear the interrupt status bit. |
| 2 DEBUG_STALL_IRQ | DEBUG STALL Interrupt Status. Write a one to the SCT clear address to clear the interrupt status bit. |
| 1 RSVD0 | Reserved, always set these bits to zero. |
| 0 COMPLETE_IRQ | This bit indicates the state of the external interrupt line. Write a one to the SCT clear address to clear the interrupt status bit. NOTE: subsequent ECC completions will be held off as long as this bit is set. Be sure to read the data from BCH_STATUS0,1 before clearing this interrupt bit. |

17.6.2 Hardware ECC Accelerator Status Register 0 (BCH_STATUS0)

The BCH STAT register provides visibility into the run-time status of the BCH and status information when processing is complete. It provides overall status of the hardware ECC accelerator.

BCH Memory Map/Register Definition

Address: 11_4000h base + 10h offset = 11_4010h

BCH_STATUS0 field descriptions

| Field | Description |
|-----------------------|--|
| 31–20 HANDLE | Software supplies a 12 bit handle for this transfer as part of the GPMI DMA PIO operation that started the transaction. That handle passes down the pipeline and ends up here at the time the BCH interrupt is signaled. |
| 19–16 COMPLETED_CE | This is the chip enable number corresponding to the NAND device from which this data came. |
| 15–8 STATUS_BLK0 | Count of symbols in error during processing of first block of flash (metadata block). The number of errors reported will be in the range of 0 to the ECC correction level for block 0. 0x00 ZERO — No errors found on block. |

Table continues on the next page...

BCH_STATUS0 field descriptions (continued)

| Field | Description |
|--------------------|--|
| | 0x01 ERROR1 — One error found on block. 0x02 ERROR2 — One errors found on block. 0x03 ERROR3 — One errors found on block. 0x04 ERROR4 — One errors found on block. 0xFE UNCORRECTABLE — Block exhibited uncorrectable errors. 0xFF ERASED — Page is erased. |
| 7–5 RSVD1 | Reserved, always set these bits to zero. |
| 4 ALLONES | 1 = All data bits of this transaction are ONE. |
| 3 CORRECTED | 1 = At least one correctable error encountered during last processing cycle. |
| 2 UNCORRECTABLE | 1 = Uncorrectable error encountered during last processing cycle. |
| 1–0 RSVD0 | Reserved, always set these bits to zero. |

17.6.3 Hardware ECC Accelerator Mode Register (BCH_MODE)

The BCH MODE register provides additional mode controls.

Contains additional global mode controls for the BCH engine.

Address: 11_4000h base + 20h offset = 11_4020h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

BCH_MODE field descriptions

| Field | Description |
|------------------------|--|
| 31–8 RSVD | Reserved, always set these bits to zero. |
| 7–0 ERASE_THRESHOLD | This value indicates the maximum number of zero bits on a flash page for it to be considered erased. For SLC NAND devices, this value should be programmed to 0 (meaning that the entire page should consist of bytes of 0xFF). For MLC NAND devices, bit errors may occur on reads (even on blank pages), so this threshold can be used to tune the erased page checking algorithm. |

17.6.4 Hardware BCH ECC Loopback Encode Buffer Register (BCH_ENCODEPTR)

When performing memory to memory operations, indicates the address of the encode buffer. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register.

For memory to memory operations, this register is used as the pointer to the encoded data, which is an output when encoding and an input while decoding.

Address: 11_4000h base + 30h offset = 11_4030h

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| R | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

BCH_ENCODEPTR field descriptions

| Field | Description |
|--------------|--|
| 31–0 ADDR | Address pointer to encode buffer. This is the source for decode operations and the destination for encode operations. This value must be aligned on a 4 byte boundary. |

17.6.5 Hardware BCH ECC Loopback Data Buffer Register (BCH_DATAPTR)

When performing memory to memory operations, indicates the address of the data buffer.

For memory to memory operations, this register is used as the pointer to the data to encode or the destination buffer for decode operations.

Address: 11_4000h base + 40h offset = 11_4040h

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

BCH_DATAPTR field descriptions

| Field | Description |
|--------------|--|
| 31–0 ADDR | Address pointer to data buffer. This is the source for encode operations and the destination for decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 byte boundary. |

17.6.6 Hardware BCH ECC Loopback Metadata Buffer Register (BCH_METAPTR)

When performing memory to memory operations, indicates the address of the metadata buffer.

For memory to memory operations, this register is used as the pointer to the metadata to encode or the extracted metadata for decode operations.

Address: 11_4000h base + 50h offset = 11_4050h

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| R | ADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

BCH_METAPTR field descriptions

| Field | Description |
|--------------|---|
| 31–0 ADDR | Address pointer to metadata buffer. This is the source for encode metadata read operations and the destination for metadata decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 byte boundary. |

17.6.7 Hardware ECC Accelerator Layout Select Register (BCH_LAYOUTSELECT)

The BCH LAYOUTSELECT register provides a mapping of chip selects to layout registers.

When the BCH engine receives a request to process a data block from the GPMI interface, it will use this register to map the incoming chip select to one of the four possible flash layout registers

Address: 11_4000h base + 70h offset = 11_4070h

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------|-------------|----|----|----|----|----|----|----|-------------|----|----|----|----|----|----|----|
| R | CS15_SELECT | | | | | | | | CS11_SELECT | | | | | | | |
| W | | | | | | | | | | | | | | | | |

| Reset | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |

BCH_LAYOUTSELECT field descriptions

| Field | Description |
|----------------------|--|
| 31–30 CS15_SELECT | Selects which layout is used for chip select 15. |
| 29–28 CS14_SELECT | Selects which layout is used for chip select 14. |
| 27–26 CS13_SELECT | Selects which layout is used for chip select 13. |
| 25–24 CS12_SELECT | Selects which layout is used for chip select 12. |
| 23–22 CS11_SELECT | Selects which layout is used for chip select 11. |
| 21–20 CS10_SELECT | Selects which layout is used for chip select 10. |
| 19–18 CS9_SELECT | Selects which layout is used for chip select 9. |
| 17–16 CS8_SELECT | Selects which layout is used for chip select 8. |
| 15–14 CS7_SELECT | Selects which layout is used for chip select 7. |
| 13–12 CS6_SELECT | Selects which layout is used for chip select 6. |
| 11–10 CS5_SELECT | Selects which layout is used for chip select 5. |
| 9–8 CS4_SELECT | Selects which layout is used for chip select 4. |
| 7–6 CS3_SELECT | Selects which layout is used for chip select 3. |
| 5–4 CS2_SELECT | Selects which layout is used for chip select 2. |
| 3–2 CS1_SELECT | Selects which layout is used for chip select 1. |
| 1–0 CS0_SELECT | Selects which layout is used for chip select 0. |

17.6.8 Hardware BCH ECC Flash 0 Layout 0 Register (BCH_FLASH0LAYOUT0)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH0LAYOUT1 register to control the format for the devices selecting layout 0 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings

that are used by the BCH block while reading/writing the flash page to control data, metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks. See the BCH programming reference manual for more information on setting up the flash layout registers.

Address: 11_4000h base + 80h offset = 11_4080h

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------|---------|----|----|----|----|---------------|------------|----|-----------|----|----|----|----|----|----|----|

| Reset | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

BCH_FLASH0LAYOUT0 field descriptions

| Field | Description |
|--------------------|--|
| 31–24 NBLOCKS | Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that 8 subsequent blocks are present for a total of 9 blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware. |
| 23–16 META_SIZE | Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata -- if set to zero, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a zero, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and will be covered by a single parity block. |
| 15–11 ECC0 | Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field. 0x0 NONE — No ECC to be performed 0x1 ECC2 — ECC 2 to be performed 0x2 ECC4 — ECC 4 to be performed 0x3 ECC6 — ECC 6 to be performed 0x4 ECC8 — ECC 8 to be performed 0x5 ECC10 — ECC 10 to be performed 0x6 ECC12 — ECC 12 to be performed 0x7 ECC14 — ECC 14 to be performed |

Table continues on the next page...

BCH_FLASH0LAYOUT0 field descriptions (continued)

| Field | Description |
|---------------------|--|
| | 0x8 ECC16 — ECC 16 to be performed 0x9 ECC18 — ECC 18 to be performed 0xA ECC20 — ECC 20 to be performed 0xB ECC22 — ECC 22 to be performed 0xC ECC24 — ECC 24 to be performed 0xD ECC26 — ECC 26 to be performed 0xE ECC28 — ECC 28 to be performed 0xF ECC30 — ECC 30 to be performed 0x10 ECC32 — ECC 32 to be performed 0x11 ECC34 — ECC 34 to be performed 0x12 ECC36 — ECC 36 to be performed 0x13 ECC38 — ECC 38 to be performed 0x14 ECC40 — ECC 40 to be performed |
| 10 GF13_0_GF14_1 | Select GF13 or GF14: 0-GF13; 1-GF14 |
| 9–0 DATA0_SIZE | Indicates the size of the data 0 block (in DWORDS / four bytes) to be stored on the flash page. If set to zero, the first block will only contain metadata. |

17.6.9 Hardware BCH ECC Flash 0 Layout 1 Register (BCH_FLASH0LAYOUT1)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH0LAYOUT0 register to control the format for the device selecting layout 0 in the LAYOUTSELECT register.

Address: 11_4000h base + 90h offset = 11_4090h

BCH_FLASH0LAYOUT1 field descriptions

| Field | Description |
|---------------------|---|
| 31–16 PAGE_SIZE | Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accomodate different flash configurations that may be available in the future. |
| 15–11 ECCN | Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata). 0x0 NONE — No ECC to be performed 0x1 ECC2 — ECC 2 to be performed 0x2 ECC4 — ECC 4 to be performed 0x3 ECC6 — ECC 6 to be performed 0x4 ECC8 — ECC 8 to be performed 0x5 ECC10 — ECC 10 to be performed 0x6 ECC12 — ECC 12 to be performed 0x7 ECC14 — ECC 14 to be performed 0x8 ECC16 — ECC 16 to be performed 0x9 ECC18 — ECC 18 to be performed 0xA ECC20 — ECC 20 to be performed 0xB ECC22 — ECC 22 to be performed 0xC ECC24 — ECC 24 to be performed 0xD ECC26 — ECC 26 to be performed 0xE ECC28 — ECC 28 to be performed 0xF ECC30 — ECC 30 to be performed 0x10 ECC32 — ECC 32 to be performed 0x11 ECC34 — ECC 34 to be performed 0x12 ECC36 — ECC 36 to be performed 0x13 ECC38 — ECC 38 to be performed 0x14 ECC40 — ECC 40 to be performed |
| 10 GF13_0_GF14_1 | Select GF13 or GF14: 0-GF13; 1-GF14 |
| 9–0 DATAN_SIZE | Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block. |

17.6.10 Hardware BCH ECC Flash 1 Layout 0 Register (BCH_FLASH1LAYOUT0)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH1LAYOUT1 register to control the format for the devices selecting layout 1 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading/writing the flash page to control data,

BCH Memory Map/Register Definition

metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks. See the BCH programming reference manual for more information on setting up the flash layout registers.

| Field | Description |
|---------------------|---|
| | 0x9 ECC18 — ECC 18 to be performed 0xA ECC20 — ECC 20 to be performed 0xB ECC22 — ECC 22 to be performed 0xC ECC24 — ECC 24 to be performed 0xD ECC26 — ECC 26 to be performed 0xE ECC28 — ECC 28 to be performed 0xF ECC30 — ECC 30 to be performed 0x10 ECC32 — ECC 32 to be performed 0x11 ECC34 — ECC 34 to be performed 0x12 ECC36 — ECC 36 to be performed 0x13 ECC38 — ECC 38 to be performed 0x14 ECC40 — ECC 40 to be performed |
| 10 GF13_0_GF14_1 | Select GF13 or GF14: 0-GF13; 1-GF14 |
| 9–0 DATA0_SIZE | Indicates the size of the data 0 block (in DWORDS / four bytes) to be stored on the flash page. If set to zero, the first block will only contain metadata. |

17.6.11 Hardware BCH ECC Flash 1 Layout 1 Register (BCH_FLASH1LAYOUT1)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH1LAYOUT0 register to control the format for the device selecting layout 1 in the LAYOUTSELECT register.

Address: 11_4000h base + B0h offset = 11_40B0h

BCH_FLASH1LAYOUT1 field descriptions

| Field | Description |
|---------------------|---|
| 31–16 PAGE_SIZE | Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accomodate different flash configurations that may be available in the future. |
| 15–11 ECCN | Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata). 0x0 NONE — No ECC to be performed 0x1 ECC2 — ECC 2 to be performed 0x2 ECC4 — ECC 4 to be performed 0x3 ECC6 — ECC 6 to be performed 0x4 ECC8 — ECC 8 to be performed 0x5 ECC10 — ECC 10 to be performed 0x6 ECC12 — ECC 12 to be performed 0x7 ECC14 — ECC 14 to be performed 0x8 ECC16 — ECC 16 to be performed 0x9 ECC18 — ECC 18 to be performed 0xA ECC20 — ECC 20 to be performed 0xB ECC22 — ECC 22 to be performed 0xC ECC24 — ECC 24 to be performed 0xD ECC26 — ECC 26 to be performed 0xE ECC28 — ECC 28 to be performed 0xF ECC30 — ECC 30 to be performed 0x10 ECC32 — ECC 32 to be performed 0x11 ECC34 — ECC 34 to be performed 0x12 ECC36 — ECC 36 to be performed 0x13 ECC38 — ECC 38 to be performed 0x14 ECC40 — ECC 40 to be performed |
| 10 GF13_0_GF14_1 | Select GF13 or GF14: 0-GF13; 1-GF14 |
| 9–0 DATAN_SIZE | Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block. |

17.6.12 Hardware BCH ECC Flash 2 Layout 0 Register (BCH_FLASH2LAYOUT0)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH2LAYOUT1 register to control the format for the devices selecting layout 2 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading/writing the flash page to control data,

metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks. See the BCH programming reference manual for more information on setting up the flash layout registers.

Address: 11_4000h base + C0h offset = 11_40C0h

| | | | | | | | | | | | | | | | | |
|-------|---------|----|----|----|----|---------------|----|------------|-----------|----|----|----|----|----|----|----|

BCH_FLASH2LAYOUT0 field descriptions

| Field | Description |
|--------------------|--|
| 31–24 NBLOCKS | Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that 8 subsequent blocks are present for a total of 9 blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware. |
| 23–16 META_SIZE | Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata -- if set to zero, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a zero, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and will be covered by a single parity block. |
| 15–11 ECC0 | Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field. 0x0 NONE — No ECC to be performed 0x1 ECC2 — ECC 2 to be performed 0x2 ECC4 — ECC 4 to be performed 0x3 ECC6 — ECC 6 to be performed 0x4 ECC8 — ECC 8 to be performed 0x5 ECC10 — ECC 10 to be performed 0x6 ECC12 — ECC 12 to be performed 0x7 ECC14 — ECC 14 to be performed 0x8 ECC16 — ECC 16 to be performed |

| 10 GF13_0_GF14_1 | Select GF13 or GF14: 0-GF13; 1-GF14 |
| 9–0 DATAN_SIZE | Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block. |

17.6.16 Hardware BCH ECC Debug Register0 (BCH_DEBUG0)

The hardware BCH accelerator internal state machines and signals can be seen in the ECC debug register.

The BCH_DEBUG0 register provides access to various internal state information which might prove useful during hardware debug and validation.

Address: 11_4000h base + 100h offset = 11_4100h

**BCH_DEBUG0 field descriptions**

| Field | Description |
|------------------------------------|---|
| 31–25 RSVD1 | Reserved, always set these bits to zero. |
| 24–16 KES_DEBUG_SYNDROME_SYMBOL | <p>The 9 bit value in this bit field will be shifted into the syndrome register array at the input of the KES engine whenever BCH_DEBUG0_KES_DEBUG_SHIFT_SYND is toggled.</p> <p>0x0 NORMAL — Bus master address generator for synd_gen writes operates normally.</p> <p>0x1 TEST_MODE — Bus master address generator always addresses last four bytes in Auxilliary block.</p> |
| 15 KES_DEBUG_SHIFT_SYND | Toggling this bit causes the value in BCH_DEBUG0_KES_SYNDROME_SYMBOL to be shift into the syndrome register array at the input to the KES engine. After shifting in 16 symbols, one can kick off both KES and CF cycles by toggling BCH_DEBUG0_KES_DEBUG_KICK. Be sure to set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking. |

Table continues on the next page...

BCH_DEBUG0 field descriptions (continued)

| Field | Description |
|----------------------------------|--|
| 14 KES_DEBUG_ PAYLOAD_FLAG | When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input payload flag. 0x1 DATA — Payload is set for 512 byte data block. 0x1 AUX — Payload is set for 65 or 19 byte auxilliary block. |
| 13 KES_DEBUG_ MODE4K | When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input mode (4K or 2K pages). 0x1 4k — Mode is set for 4K NAND pages. 0x1 2k — Mode is set for 2K NAND pages. |
| 12 KES_DEBUG_ KICK | Toggling causes KES engine FSM to start as if kick by the Bus Master. This allows stand alone testing of the KES and Chien Search engines. Be sure to set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking. |
| 11 KES_ STANDALONE | Set to one to cause the KES engine to suppress toggling the KES_BM_DONE signal to the bus master and to suppress toggling the CF_BM_DONE signal by the CF engine. 0x0 NORMAL — Bus master address generator for synd_gen writes operates normally. 0x1 TEST_MODE — Bus master address generator always addresses last four bytes in Auxilliary block. |
| 10 KES_DEBUG_ STEP | Toggling this bit causes the KES FSM to skip passed the stall state if it is in DEBUG_STALL mode and it has completed processing a block. |
| 9 KES_DEBUG_ STALL | Set to one to cause KES FSM to stall after notifying Chien search engine to start processing its block but before notifying the bus master that the KES computation is complete. This allows a diagnostic to stall the FSM after each blocks key equations are solved. This also has the effect of stalling the CSFE search engine so it's state can be examined after it finishes processing the KES stalled block. 0x0 NORMAL — KES FSM proceeds to next block supplied by bus master. 0x1 WAIT — KES FSM waits after current equations are solved and the search engine is started. |
| 8 BM_KES_TEST_ BYPASS | 1 = Point all synd_gen writes to dummy area at the end of the AUXILLIARY block so that diagnostics can preload all payload, parity bytes and computed syndrome bytes for test the KES engine. 0x0 NORMAL — Bus master address generator for synd_gen writes operates normally. 0x1 TEST_MODE — Bus master address generator always addresses last four bytes in Auxilliary block. |
| 7–6 RSVD0 | Reserved, always set these bits to zero. |
| 5–0 DEBUG_REG_ SELECT | The value loaded in this bit field is used to select the internal register state view of KES engine or the Chien search engine. |

17.6.17 KES Debug Read Register (BCH_DBGKESREAD)

The hardware BCH ECC accelerator key equation solver internal state machines and signals can be seen in the ECC debug registers.

Address: 11_4000h base + 110h offset = 11_4110h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

BCH_BLOCKNAME field descriptions

| Field | Description |
|--------------|---|
| 31–0 NAME | Should be the ASCII characters BCH (0x20, H, C, B). |

17.6.22 BCH Version Register (BCH_VERSION)

This register always returns a known read value for debug purposes and indicates the version of the block and RTL version in use.

Address: 11_4000h base + 160h offset = 11_4160h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|-------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | MAJOR | | | | | | | | MINOR | | | | | | | | STEP | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

BCH_VERSION field descriptions

| Field | Description |
|----------------|--|
| 31–24 MAJOR | Fixed read-only value reflecting the MAJOR field of the RTL version. |
| 23–16 MINOR | Fixed read-only value reflecting the MINOR field of the RTL version. |
| 15–0 STEP | Fixed read-only value reflecting the stepping of the RTL version. |

Chapter 18

Clock Controller Module (CCM)

18.1 Overview

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
 - PLL1 also referenced as ARM PLL
 - PLL2 also referenced as System PLL
 - PLL3 also referenced as USB1 PLL
 - PLL4 also referenced as Audio PLL
 - PLL5 also referenced as Video PLL
 - PLL6 also referenced as ENET PLL
 - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
 - PLL8 also referenced as MLB PLL
- Uses programmable bits to control frequencies of the clock roots.
- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of DVFS and power gating operations.

18.1.1 Features

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- ARM core root clock is generated from a dedicated source clock.

- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM_CLKO1 and CCM_CLKO2 onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for ARM core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
 - PLL - Interfaces for each PLL
 - LPCG - Low Power Clock Gating unit
 - SRC - System Reset Controller
 - GPC - General Power Controller

18.1.2 CCM Block Diagram

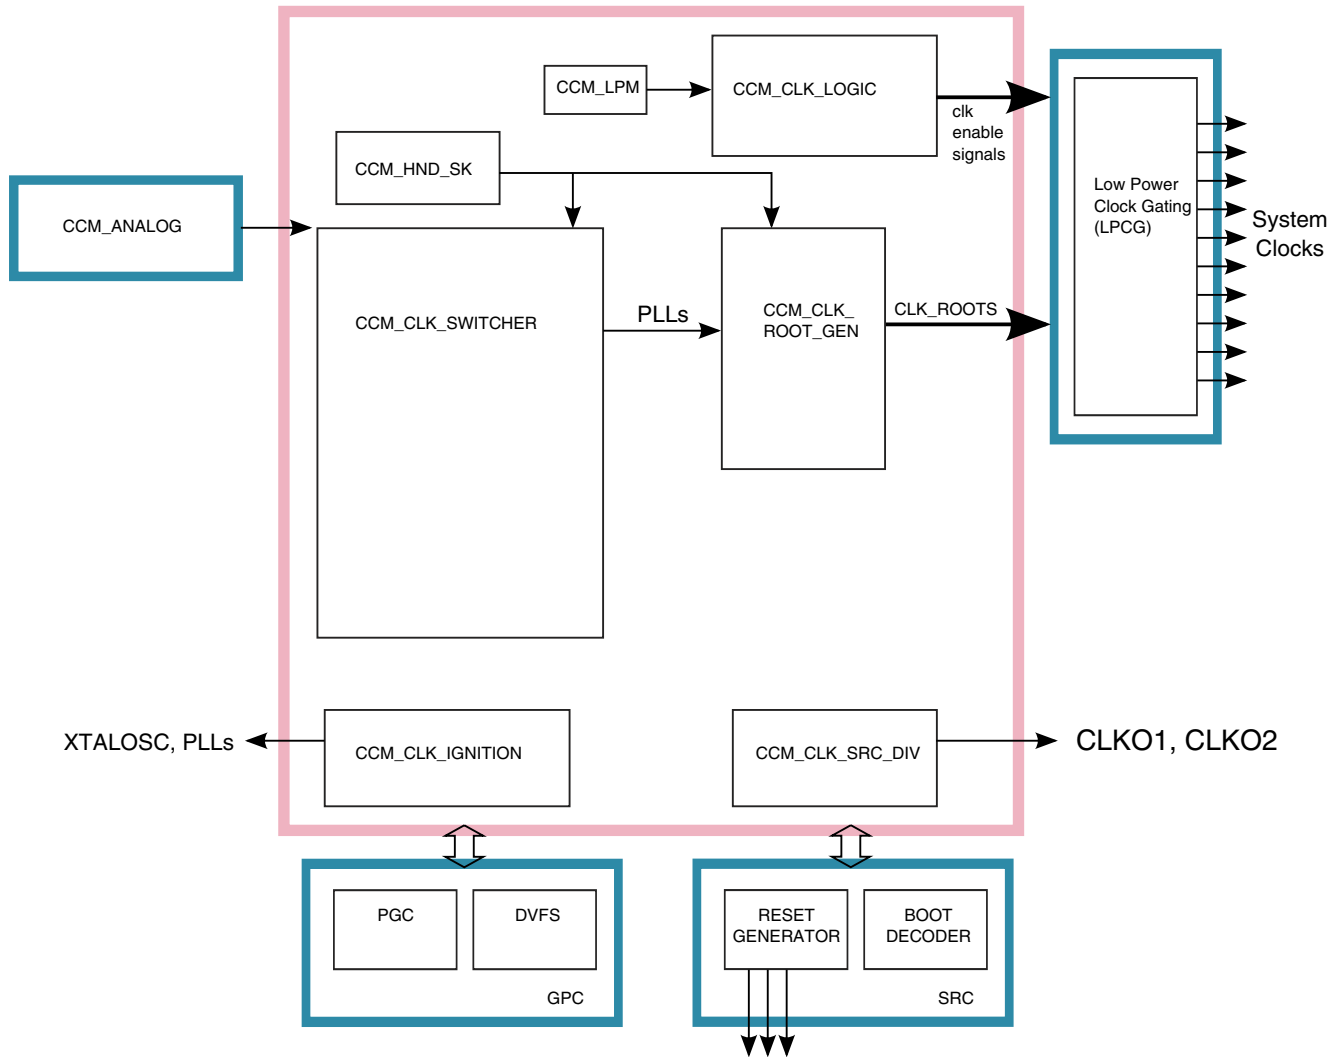

Figure 18-1. Block Diagram

CCM Contains the following sub-blocks:

Table 18-1. CCM Sub-blocks

| Sub-block | Description |
|------------------|---|
| CCM_CLK_IGNITION | Manages the ignition process. This module starts its functionality once CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset. |
| CCM_CLK_SWITCHER | Receives the clock outputs of the four PLLs, together with the bypass clocks for four PLLs , and generates three switcher clock outputs (pll1_sw_clk, pll2_sw_clk, pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module. |
| CCM_CLK_ROOT_GEN | Receives the four main clocks (PLL1, PLL2, PLL3, PLL4) and generates the output root clocks. |
| CCM_CLK_LOGIC | Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks. |

Table continues on the next page...

Table 18-1. CCM Sub-blocks (continued)

| Sub-block | Description |
|-----------------|---|
| CCM_LPM | Manages the low power modes of the IC. |
| CCM_CLK_SRC_DIV | Muxes different clocks to two output clocks, CCM_CLKO1 and CCM_CLKO2, for observability. These output clocks are connected to the pads and can provide support for testing. |
| CCM_HND_SK | Manages the handshake when changing root clock dividers that require handshake, and manages the frequency change in case of dvfs scenario. |

18.2 External Signals

The following table describes the external signals of CCM:

Table 18-2. CCM External Signals

| Signal | Description | Pad | Mode | Direction |
|--------------------|---|----------------|------------------|-----------|
| CCM_CLKO1 | Observability clock 1 output | CSI0_MCLK | ALT3 | O |
| | | GPIO_0 | ALT0 | |
| | | GPIO_19 | ALT3 | |
| | | GPIO_5 | ALT3 | |
| CCM_CLKO2 | Observability clock 2 output | GPIO_3 | ALT4 | O |
| | | NANDF_CS2 | ALT4 | |
| CCM_PMIC_READY | Signal coming from PMIC to indicate that the voltage started to change as result of change in CCM_PMIC_VSTBY_REQ | EIM_EB0 | ALT4 | I |
| | | GPIO_17 | ALT2 | |
| CCM_PMIC_VSTBY_REQ | Goes to PMIC_VSTBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage. | PMIC_VSTBY_REQ | No Muxing (ALT0) | I |
| CCM_REF_EN_B | Enable external reference clock (CKIH) | GPIO_9 | ALT3 | O |

18.3 CCM Clock Tree

The figure found here shows the clock tree configuration and clock roots for CCM.

For detailed sub-block information, please see:

- [Clock Switcher](#)
- [Clock Root Generator](#)

- [Low Power Clock Gating module \(LPCG\)](#)
- [System Clocks](#)

NOTE

The default frequency values (in MHz) for the PLLs and PFDs is the maximum allowed frequency. The PLL and PFD control registers should not be programmed to exceed these values.

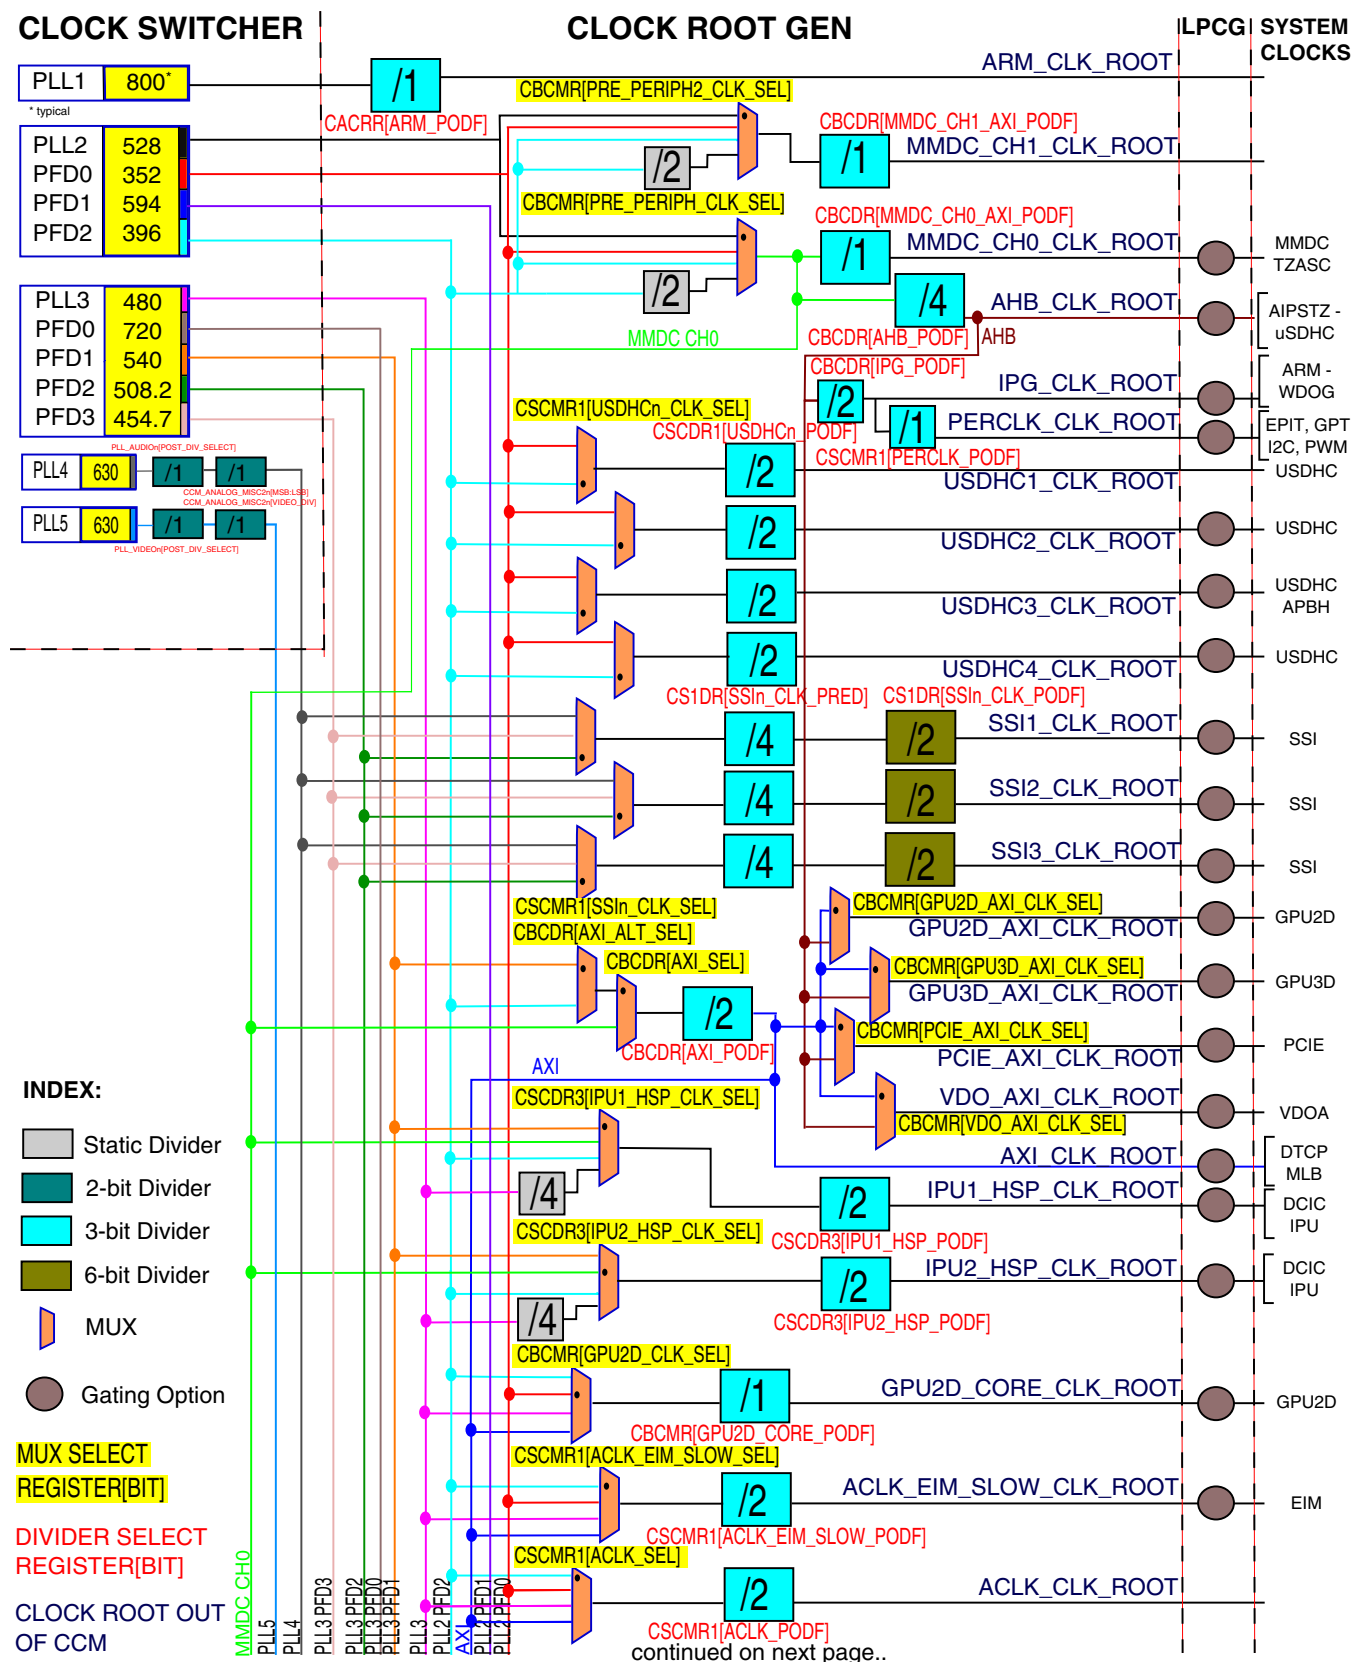

Figure 18-2. Clock Tree - Part 1

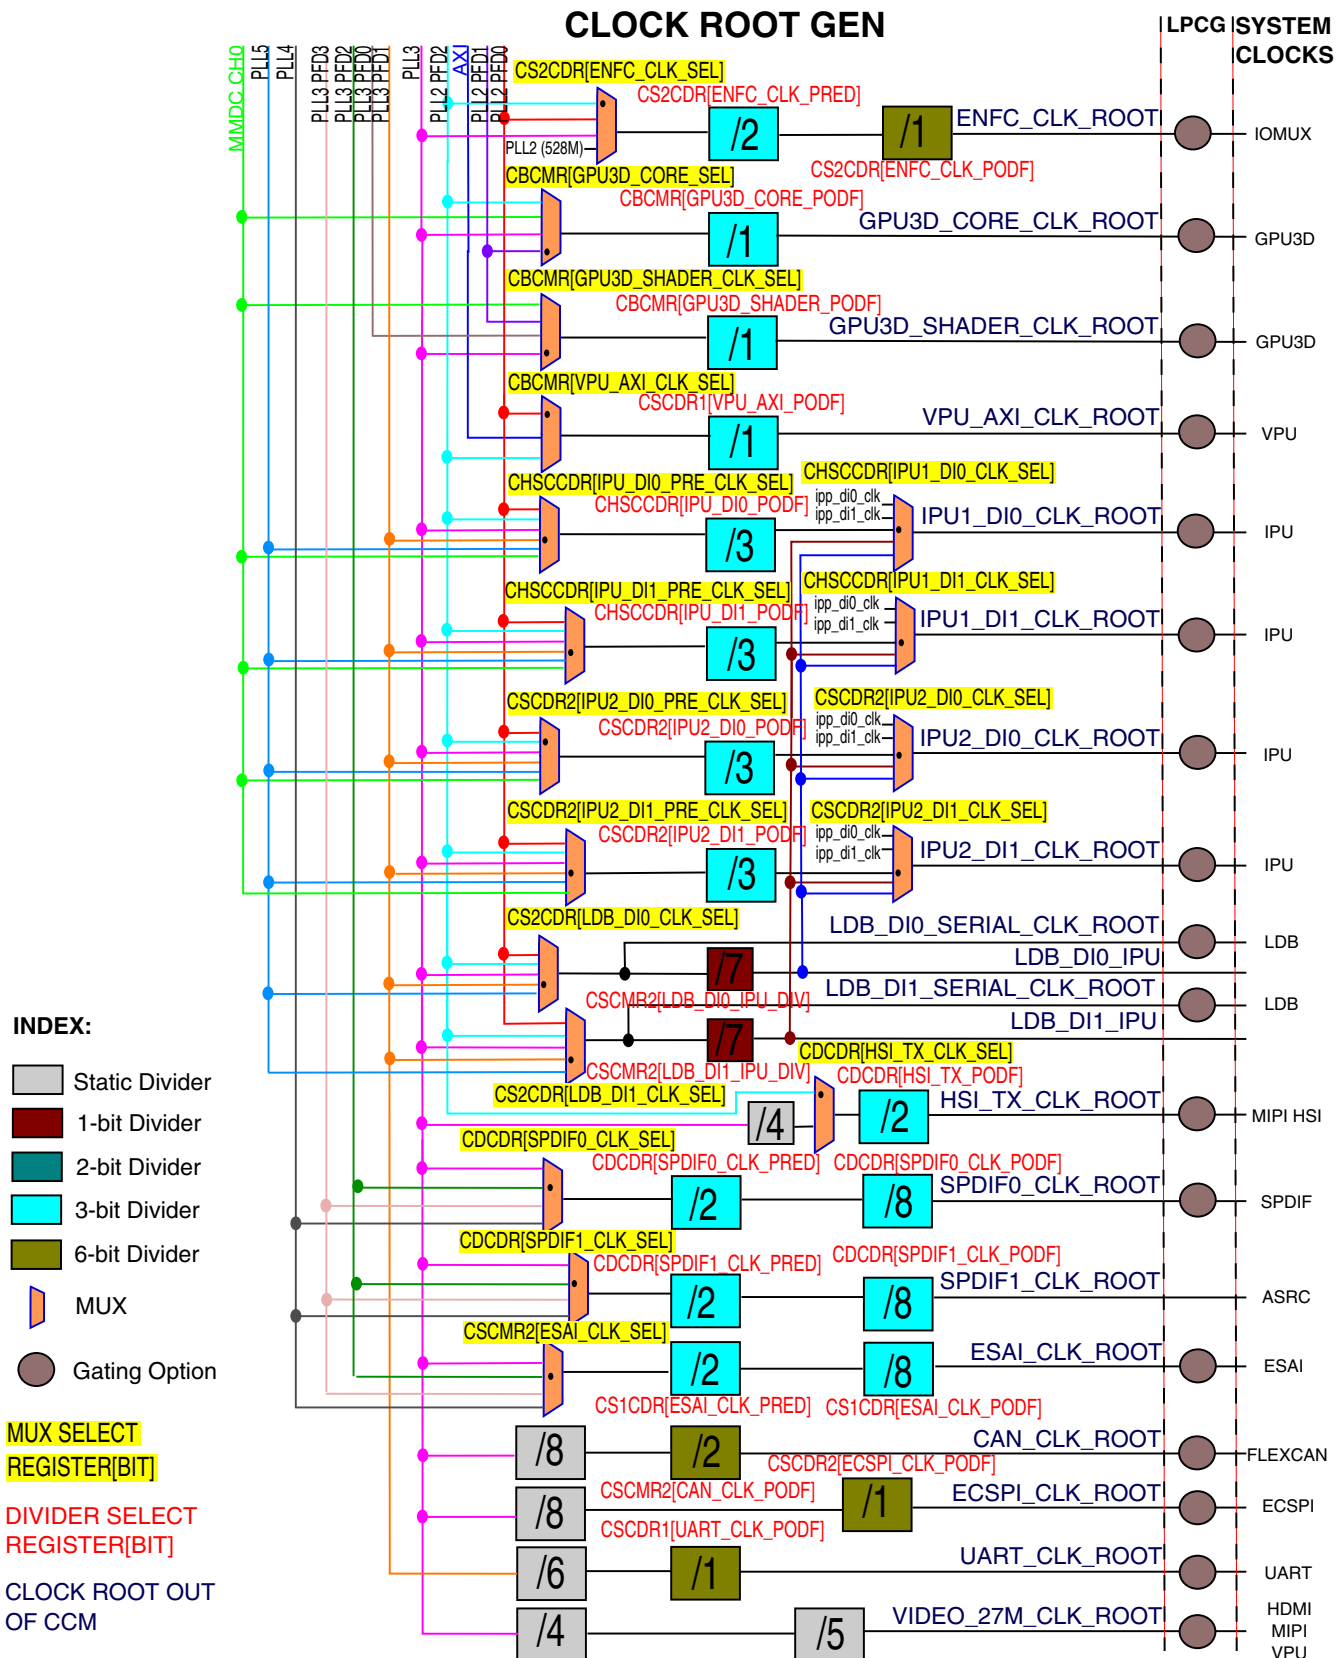

Figure 18-3. Clock Tree - Part 2

18.4 System Clocks

The table found here shows the CCM output clocks' system-level connectivity.

The gating option in the table can either be CGR bit or clock enable from the block itself. Applicable override bits are also shown.

| Block Instance | Clock | Clock Root | Gating CCM_CCGR bits | Override CCM_CMEOR bits |
|----------------|-----------------|-----------------------|----------------------------|-------------------------|
| AIPSTZn | hclk | ahb_clk_root | aips_tz1_clk_enable | |
| APBH | hclk | usdhc3_clk_root | apbhdma_hclk_enable | |
| | sec_mst_hclk | usdhc3_clk_root | apbhdma_hclk_enable | |

18.5 Functional Description

This section provides a complete functional description of the block.

18.5.1 Clock Generation

18.5.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG_CLK and supplied to modules that need it.

18.5.1.1.1 CKIL synchronizing to IPG_CLK

CKIL is synchronized to ipg_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

18.5.1.2 External High Frequency Clock - CKIH and internal oscillator

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

18.5.1.3 PLL reference clock

There are several PLLs in this chip.

PLL1 - ARM PLL (typical functional frequency 1 GHz)

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

PLL8 - MLB PLL

Some of the PLLs are described in the sections below. See [CCM Analog Memory Map/ Register Definition](#) for register information.

18.5.1.3.1 ARM PLL

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. The output frequency is selected by a 7-bit register field CCM_ANALOG_PLL_ARM[DIV_SELECT].

PLL output frequency = Fref * DIV_SEL/2

18.5.1.3.2 USB PLLs

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV_SELECT register field, this PLL should always be set to 480 MHz in normal operation. USB2 PLL is only used by the USB UTM interface through a direct connection.

18.5.1.3.3 System PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus 3 PFD outputs. The System PLL supports spread spectrum modulation for use in applications to minimize radiated emissions. The spread spectrum PLL output clock is frequency modulated so that the energy is spread over a wider bandwidth, thereby reducing peak radiated emissions. Due to this feature support, the associated lock time of this PLL is longer than other PLLs in the SoC that do not support spread spectrum modulation.

Spread spectrum operation is controlled by configuring the CCM_ANALOG_PLL_SYS_SS register. When enabled, the PLL output frequency will decrease by the amount defined in the STEP field, until it reaches the limiting frequency in the STOP field. The frequency will then similarly return to the original nominal frequency. The following equations control the spread-spectrum operation:

$$\text{Spread spectrum range} = \text{Fref} \times \frac{\text{CCM_ANALOG_PLL_SYS_SS[STOP]}}{\text{CCM_ANALOG_PLL_SYS_DENOM[B]}}$$

$$\text{Modulation frequency} = \text{Fref} \times \frac{\text{CCM_ANALOG_PLL_SYS_SS[STEP]}}{2 \times \text{CCM_ANALOG_PLL_SYS_SS[STOP]}}$$

Although this PLL does have a DIV_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

This PLL also supports a Fractional-N synthesizer.

18.5.1.3.4 Audio / Video PLL

The audio PLL and video PLL each synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL and /1, /2, /4 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM_ANALOG_PLL_AUDIO, CCM_ANALOG_PLL_VIDEO, and CCM_ANALOG_MISC2 register sets according to the following equation.

$$\text{PLL output frequency} = \text{Fref} * (\text{DIV_SELECT} + \text{NUM/DENOM})$$

18.5.1.3.5 MLB PLL

The MediaLB PLL is necessary in the MediaLB 6-Pin implementation to phase align the internal and external clock edges, effectively tuning out the delay of the differential clock receiver. The PLL is also responsible for generating the higher speed internal clock when the internal-to-external clock ratio is not 1:1.

18.5.1.3.6 Ethernet PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The PLL outputs a 500 MHz clock. The reference clocks generated by this PLL are:

- Ref_PCIE = 125 MHz
- Ref_SATA = 100 MHz
- Ref_ethernet, which is configurable based on the PLL_ENET[1:0] register field.

18.5.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to $F_{vco} * 18/N$, N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See [CCM Analog Memory Map/Register Definition](#).

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx_CLKGATE bit in CCM_ANALOG_PFD_480n or CCM_ANALOG_PFD_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at www.freescale.com for procedure details.

18.5.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM_CLK_SWITCHER

CCM_CLK_ROOT_GEN

18.5.1.5.1 Clock Switcher

The Clock Switcher (CCM_CLK_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

[Figure 18-4](#) describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

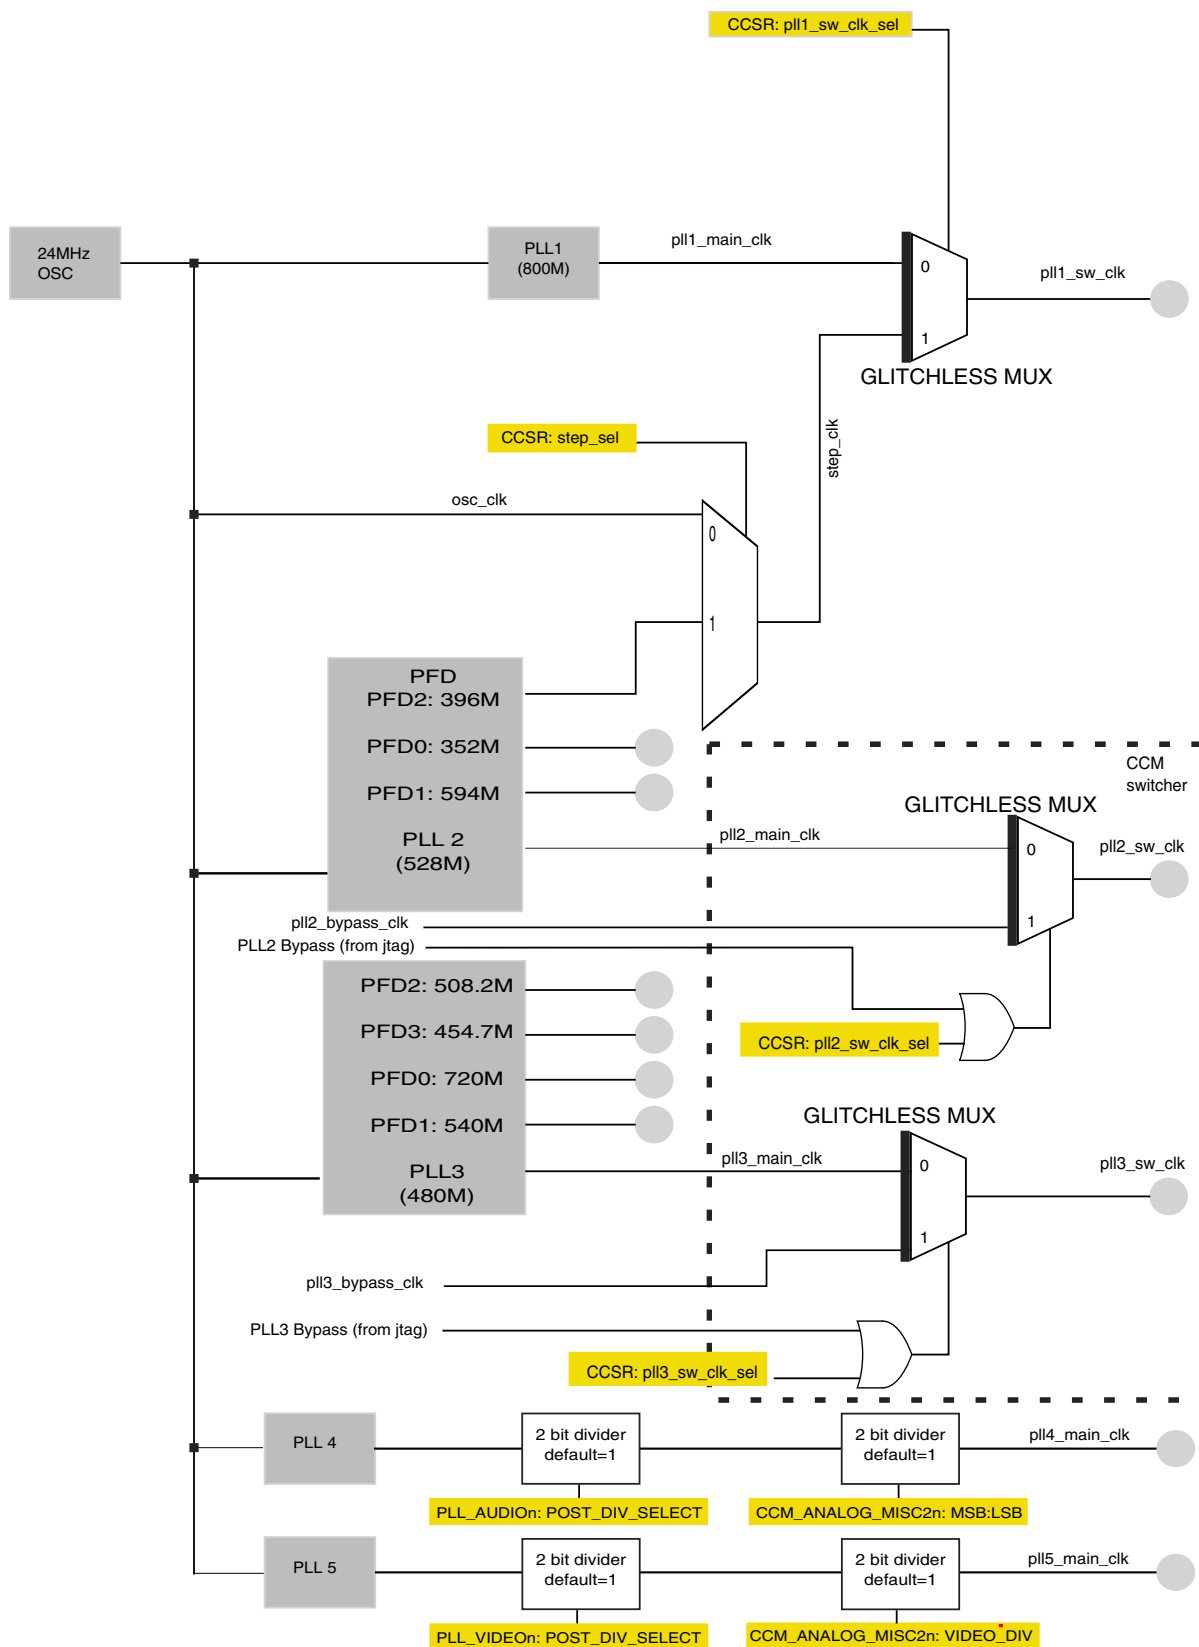

Figure 18-4. Switcher clock generation

18.5.1.5.2 PLL bypass procedure

In addition to PLL bypass options in CCM_ANALOG module, switcher and clk_root_gen sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clk, and in this way supply to the pll_sw_clk outputs an external bypass clock.

18.5.1.5.3 PLL clock change

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See [Disabling / Enabling PLLs](#) for more information.

18.5.1.5.4 Clock Root Generator

The Clock Root Generator (CCM_CLK_ROOT_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parantheses are the default typical frequencies.

Functional Description

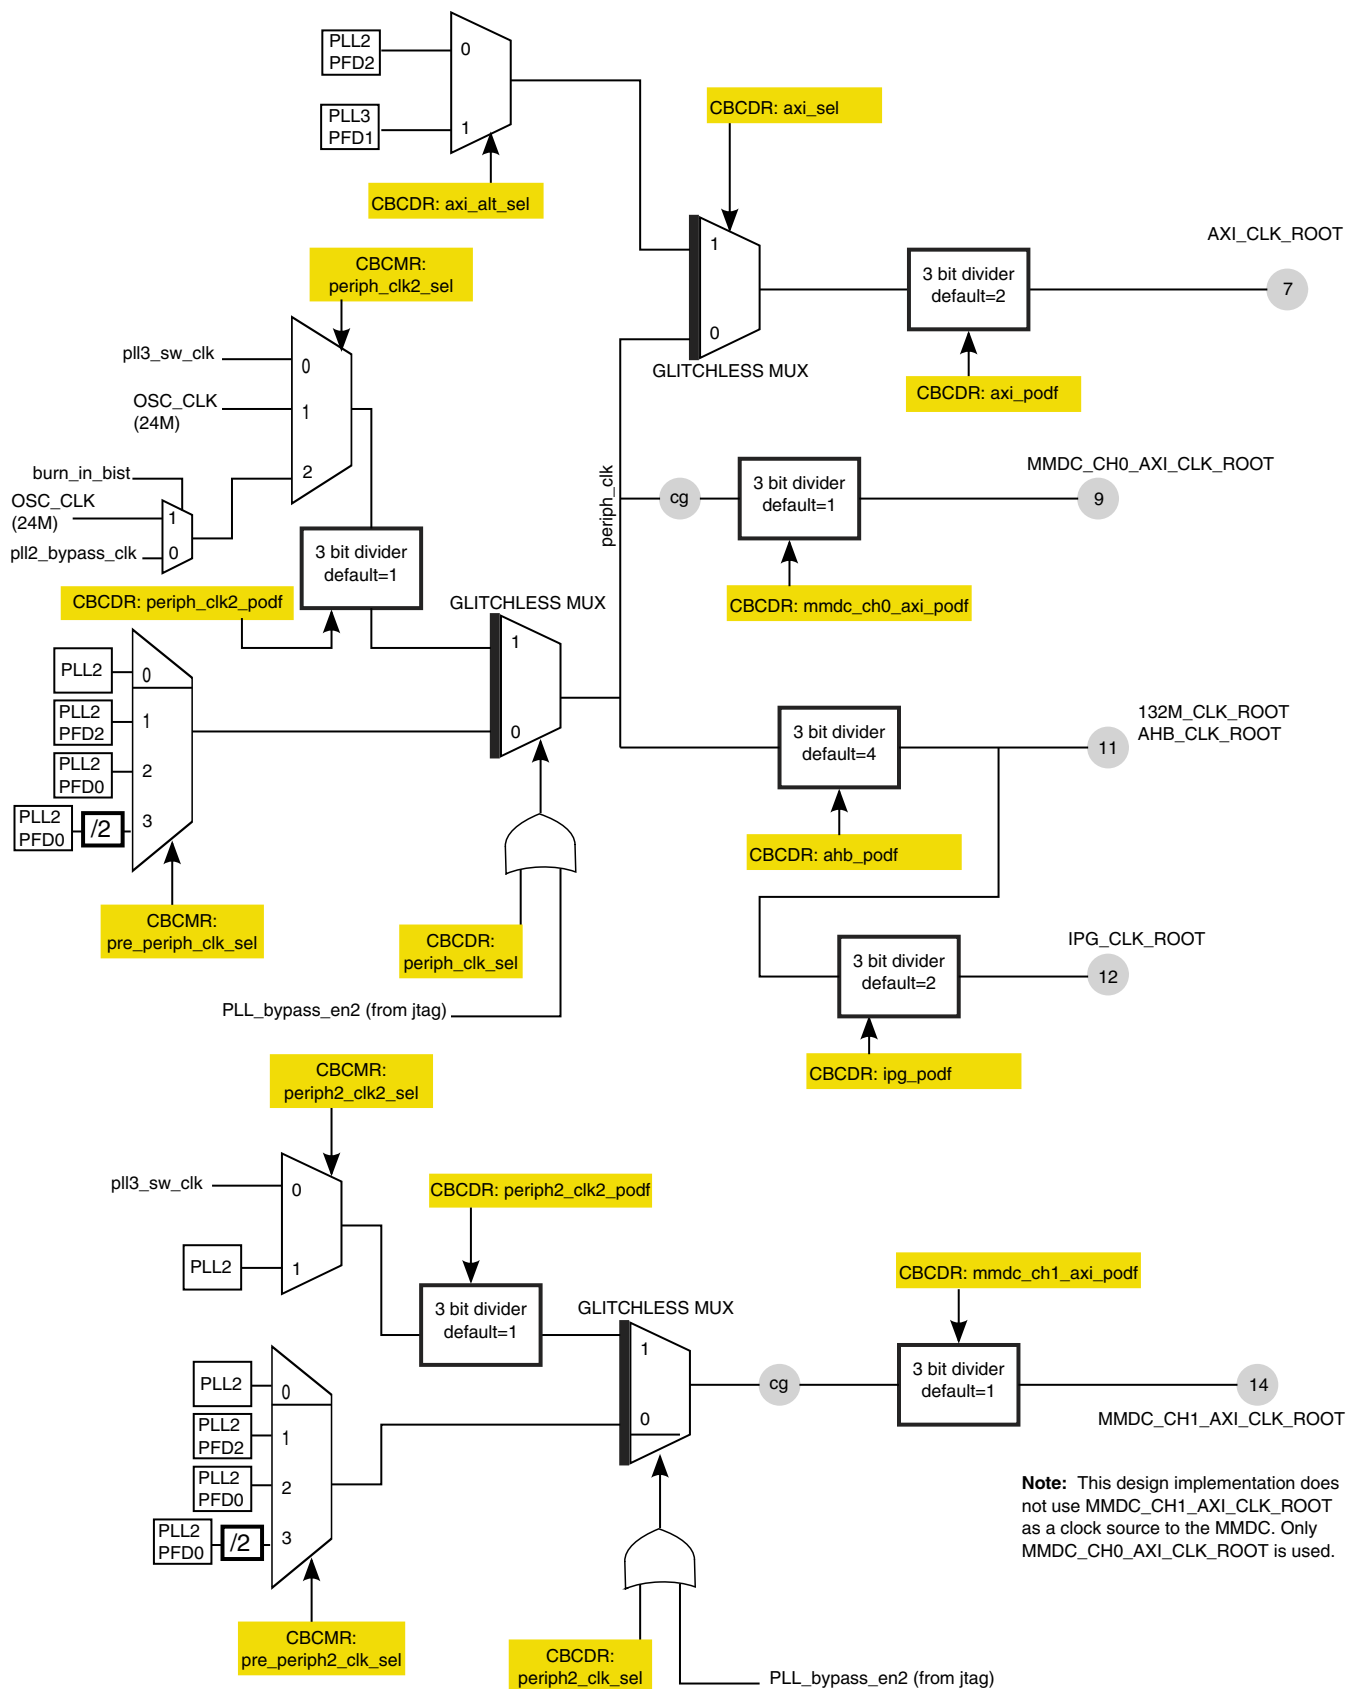

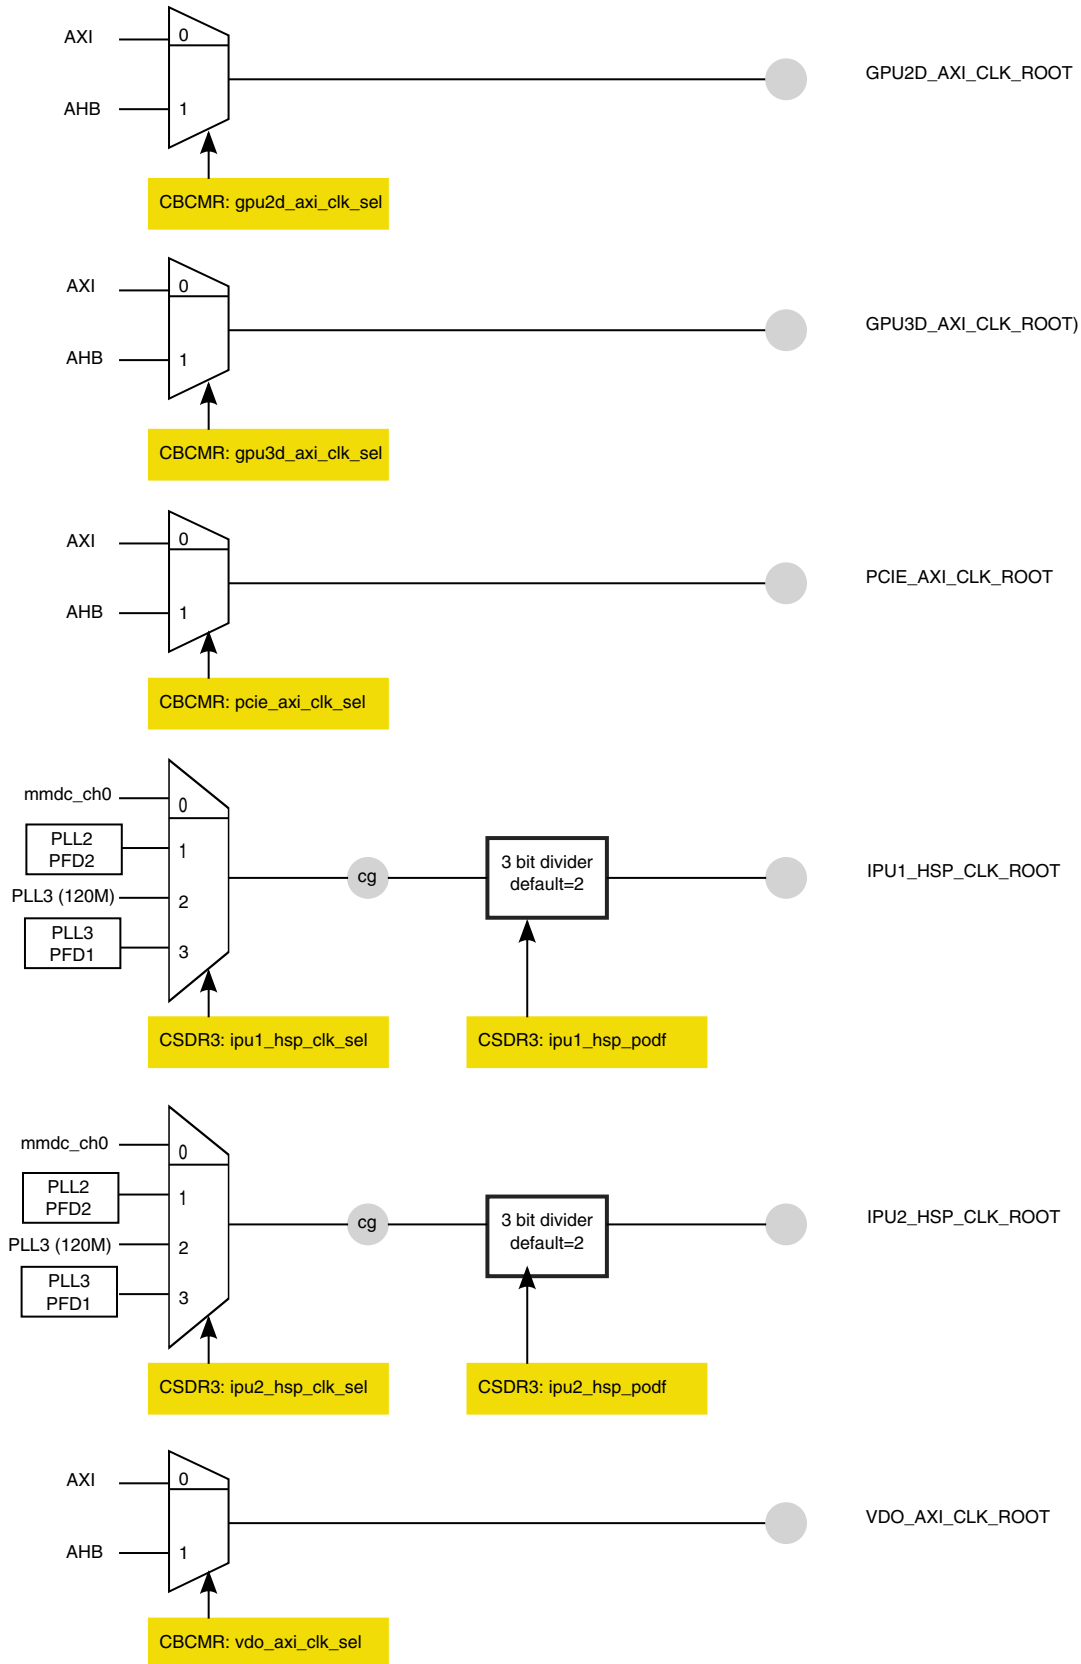

Figure 18-5. BUS clock generation

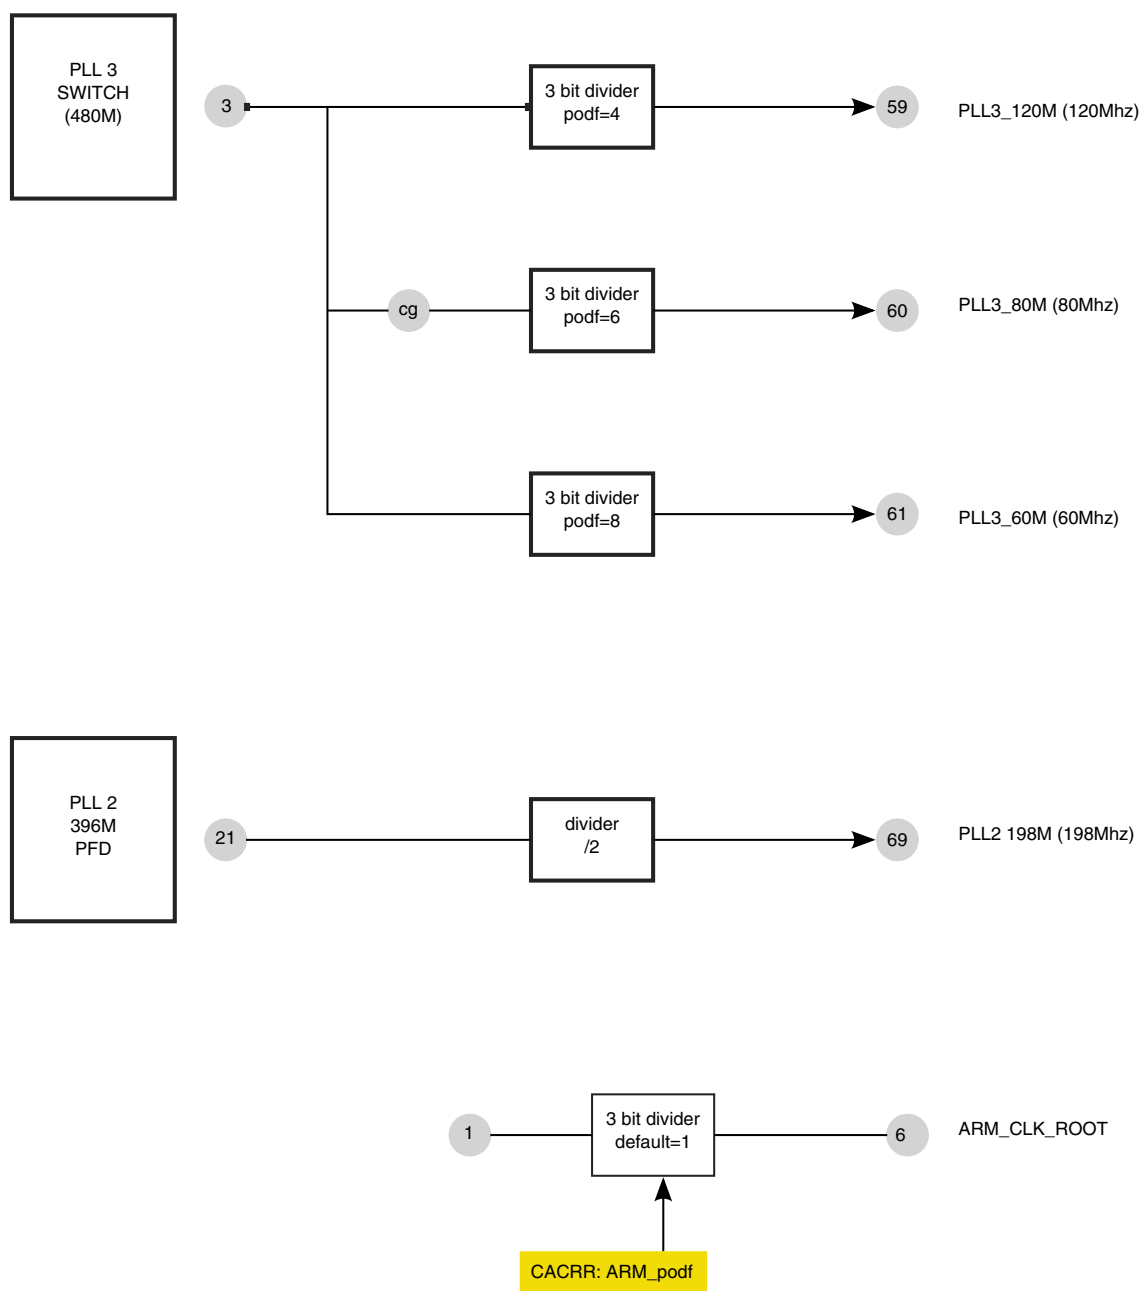

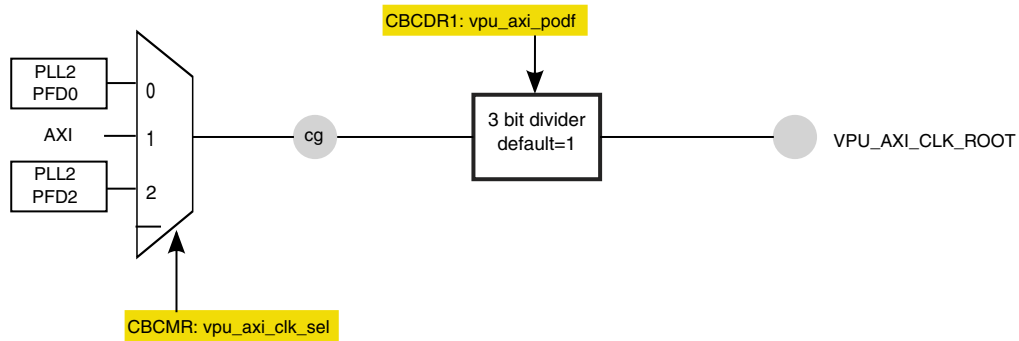

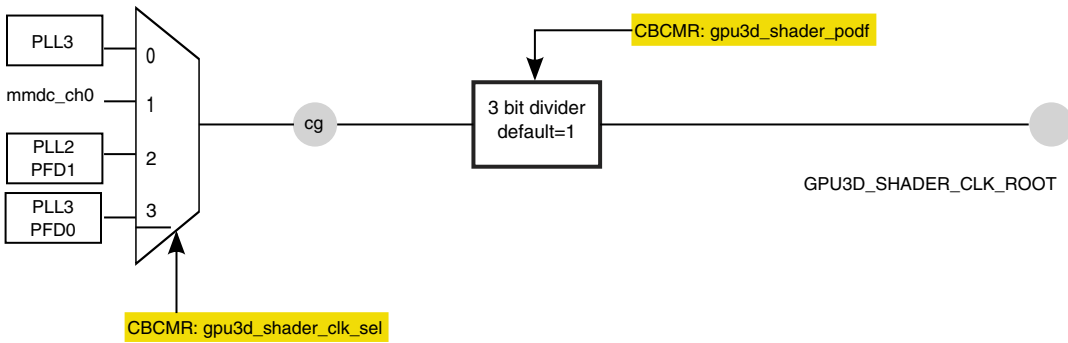

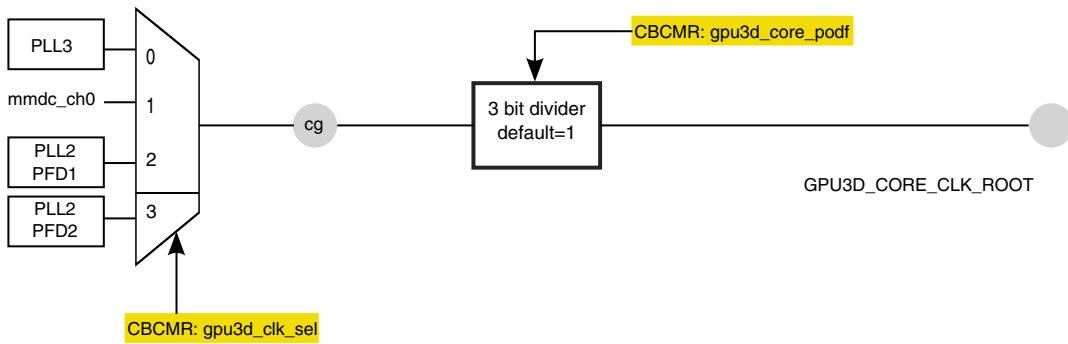

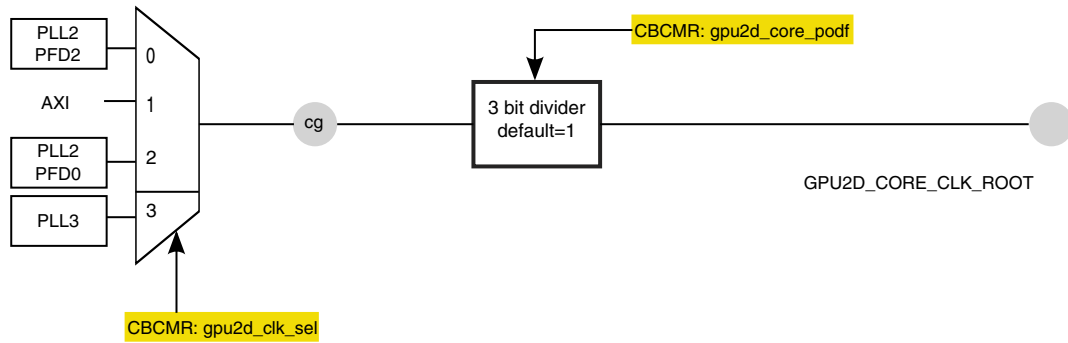

Figure 18-6. AXI clocks generation

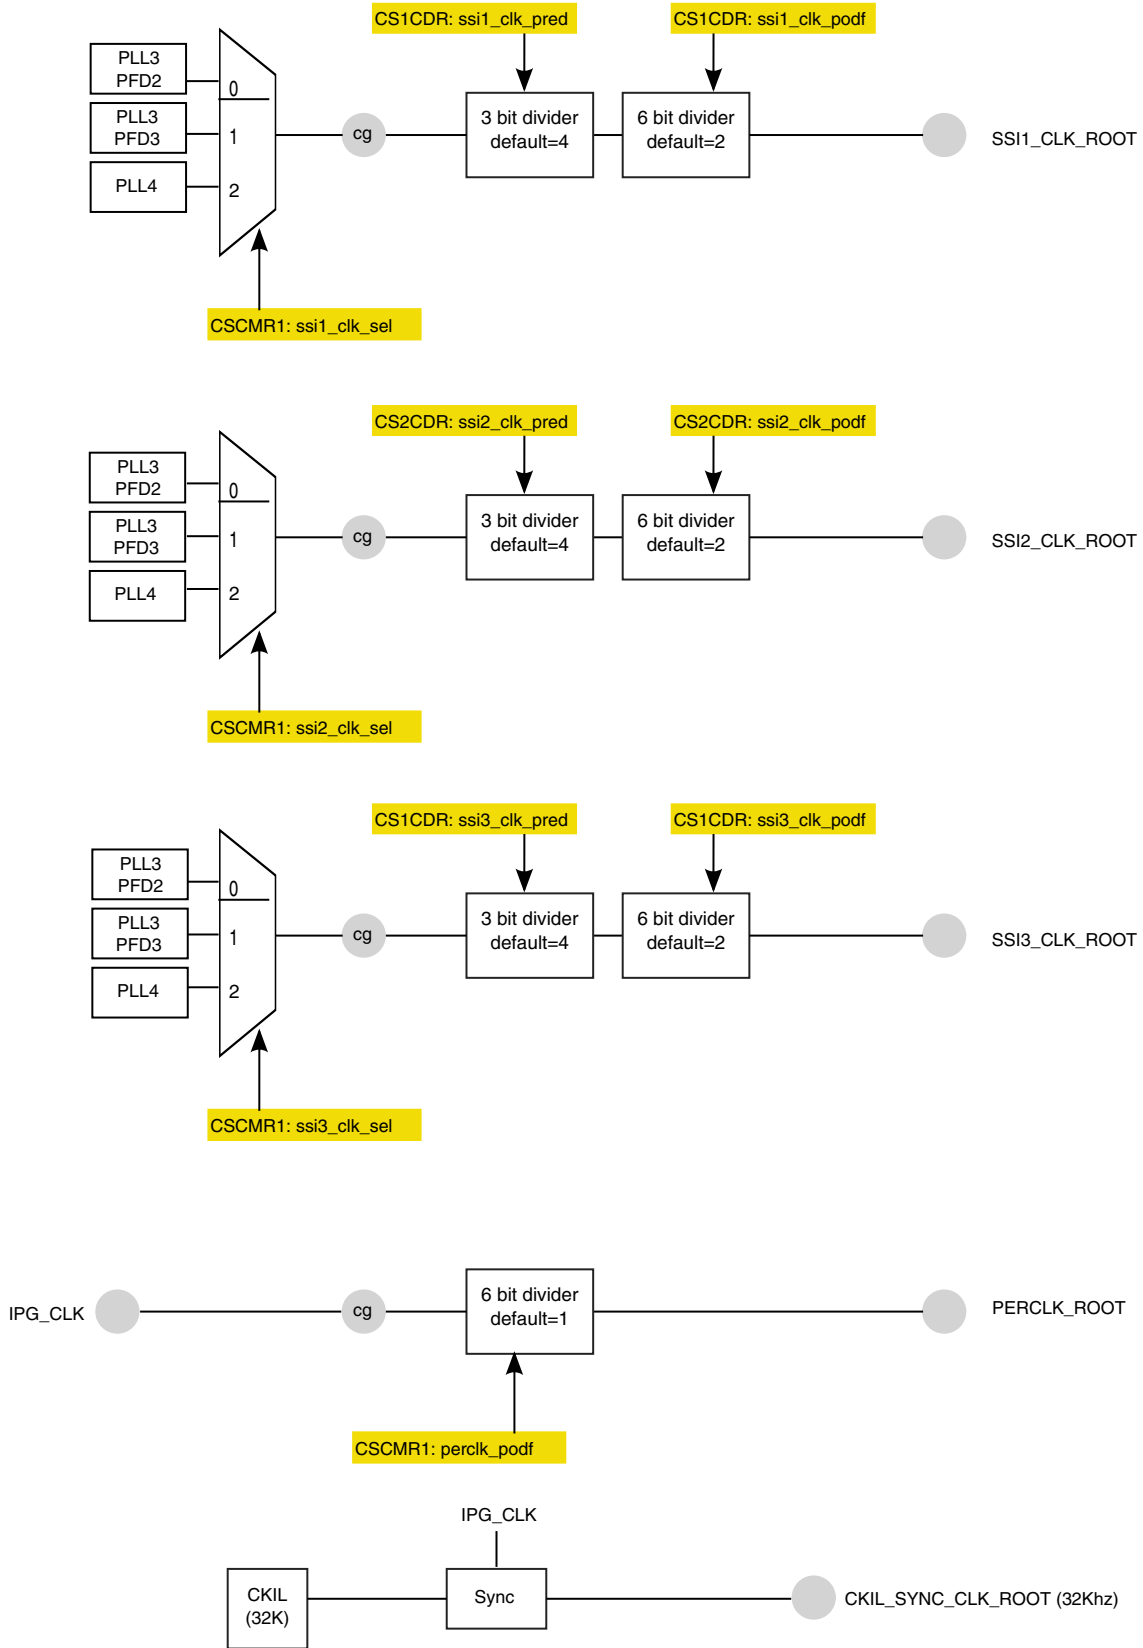

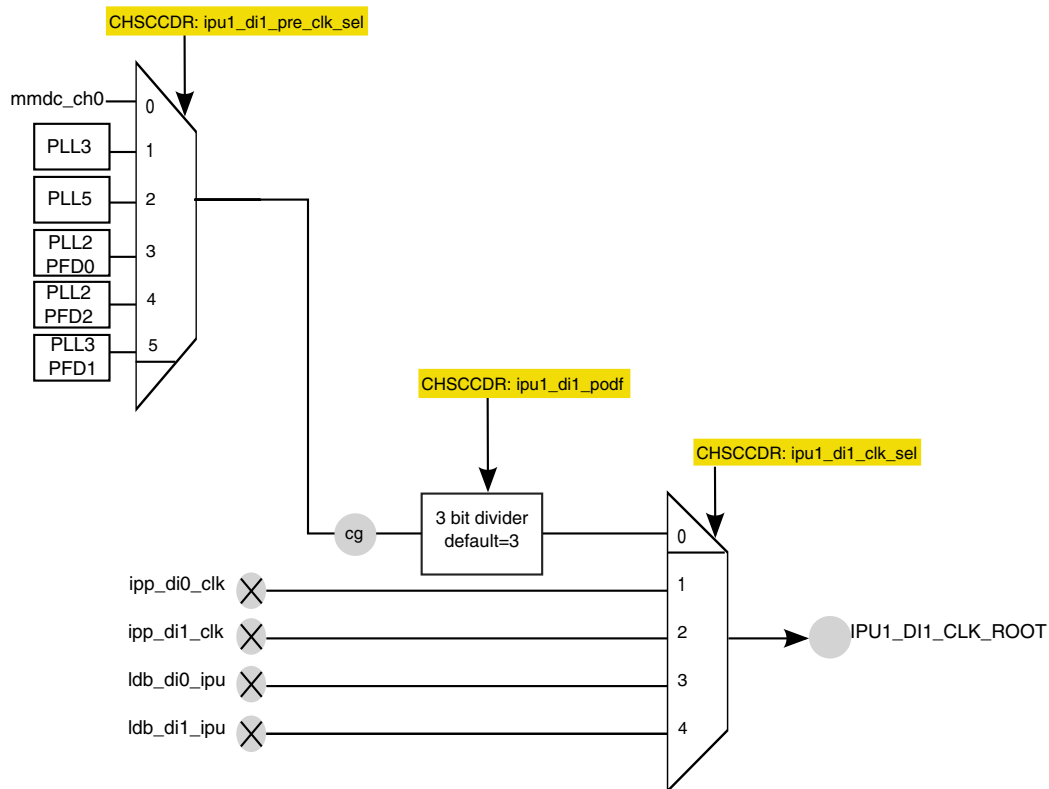

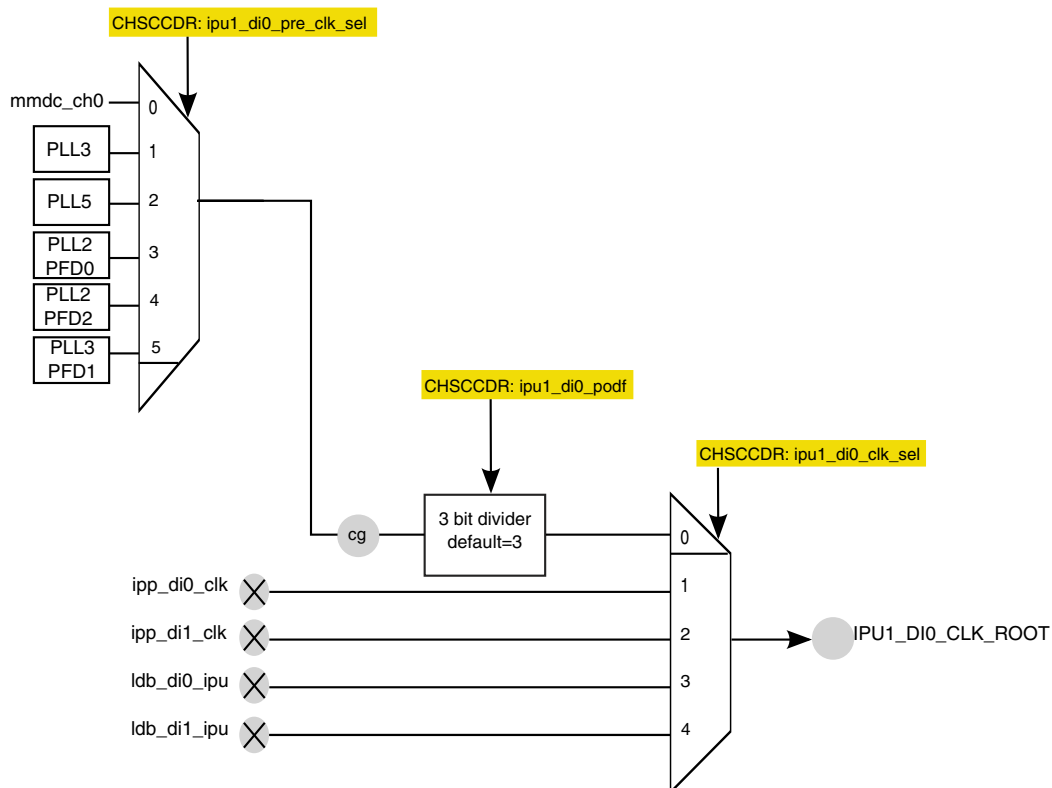

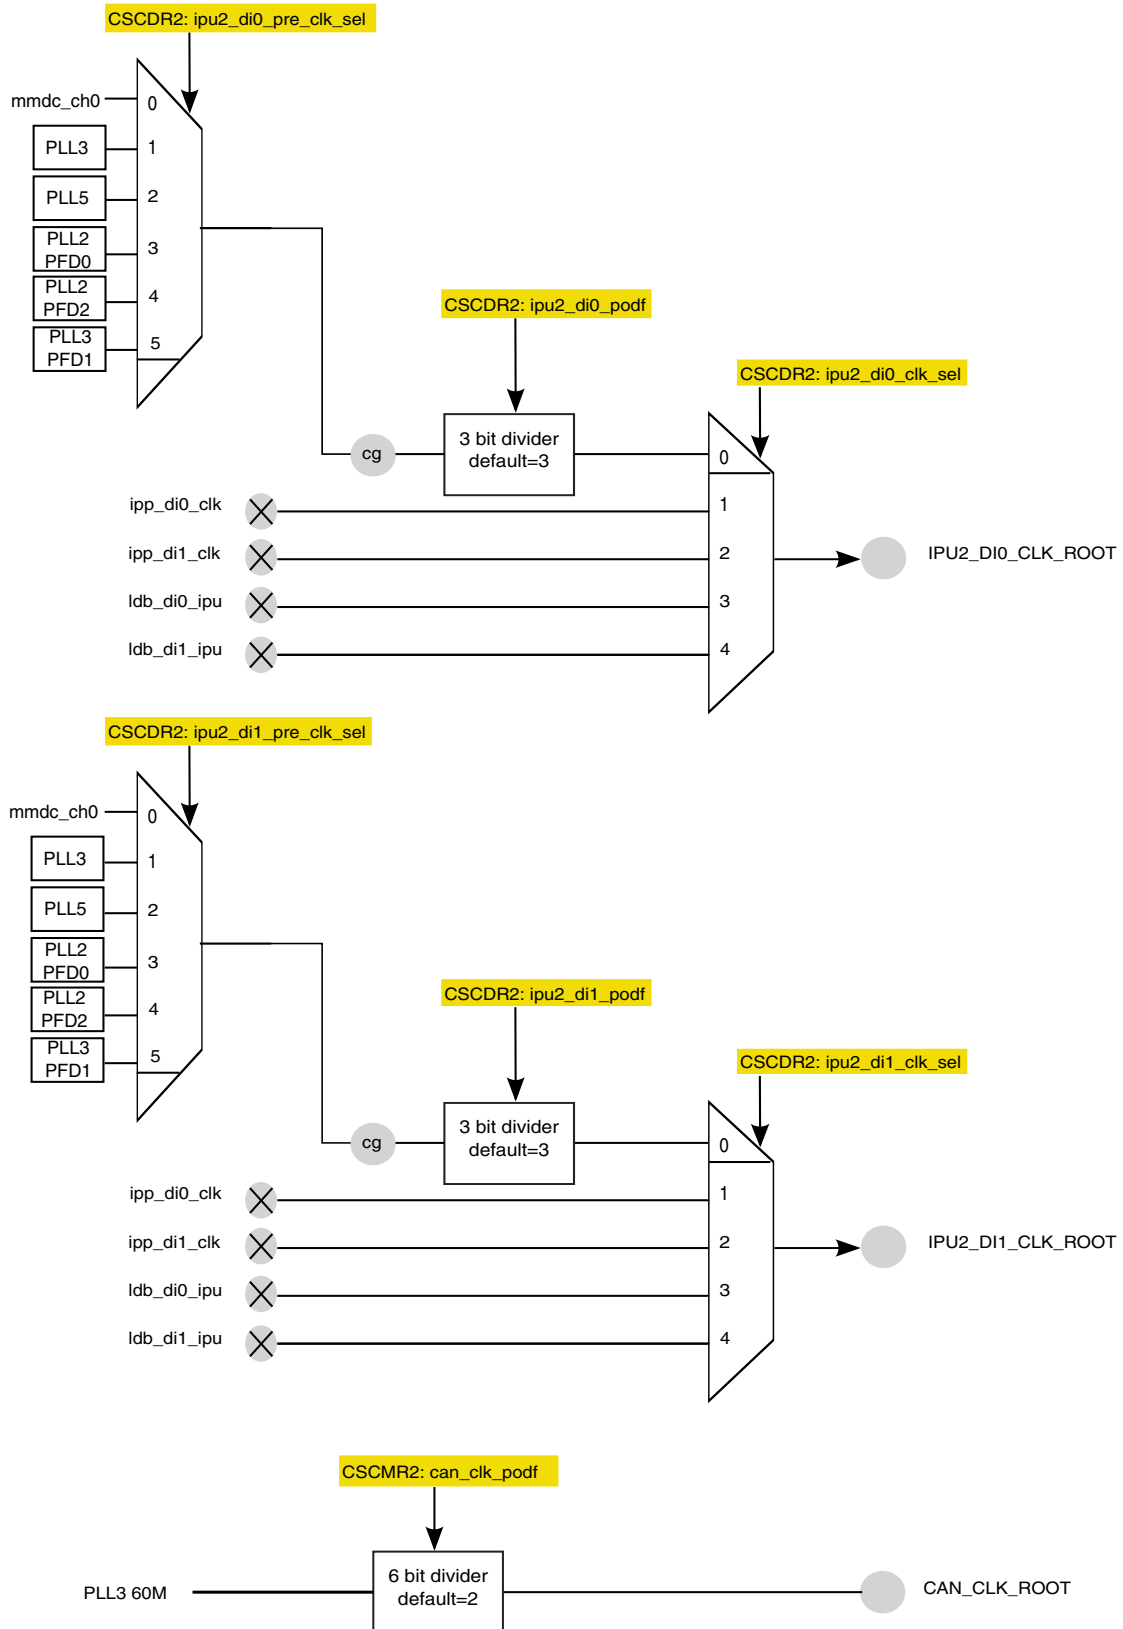

Figure 18-7. Serial clock generation

Functional Description

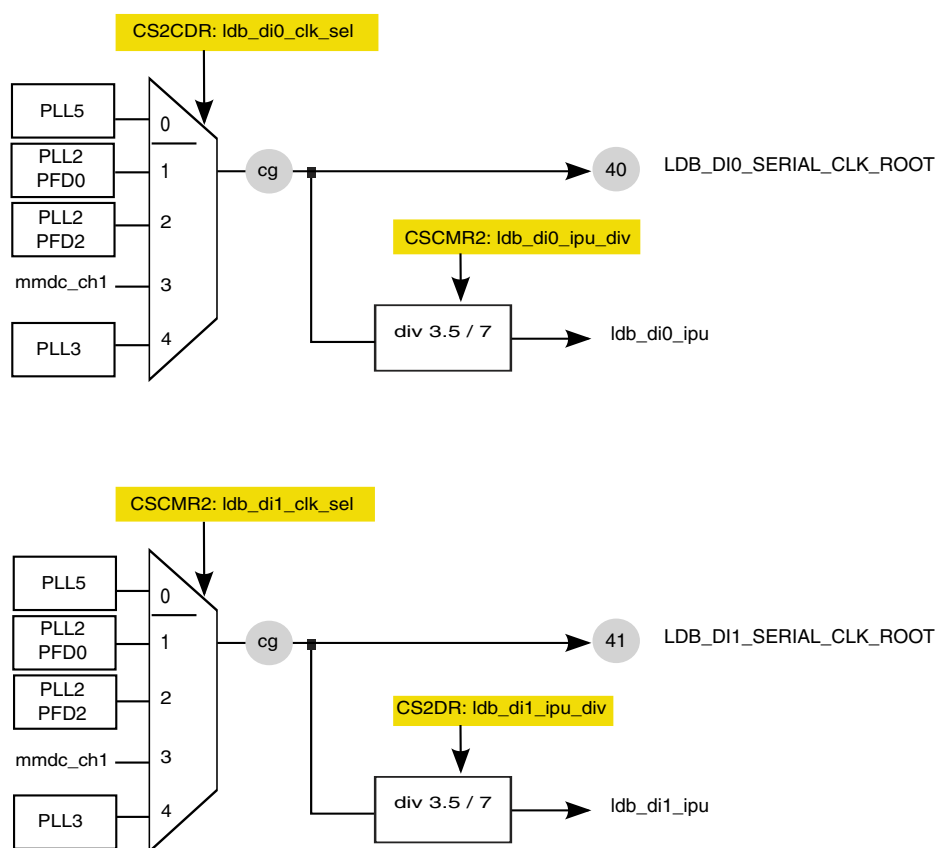

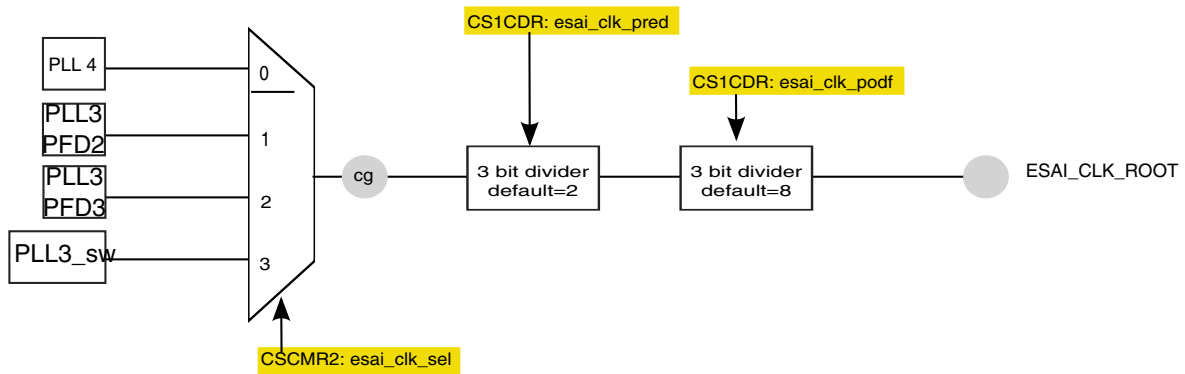

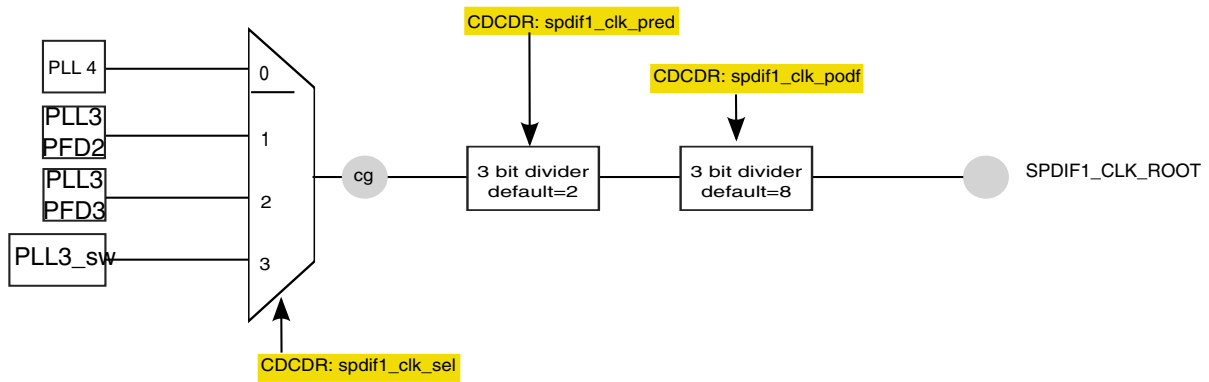

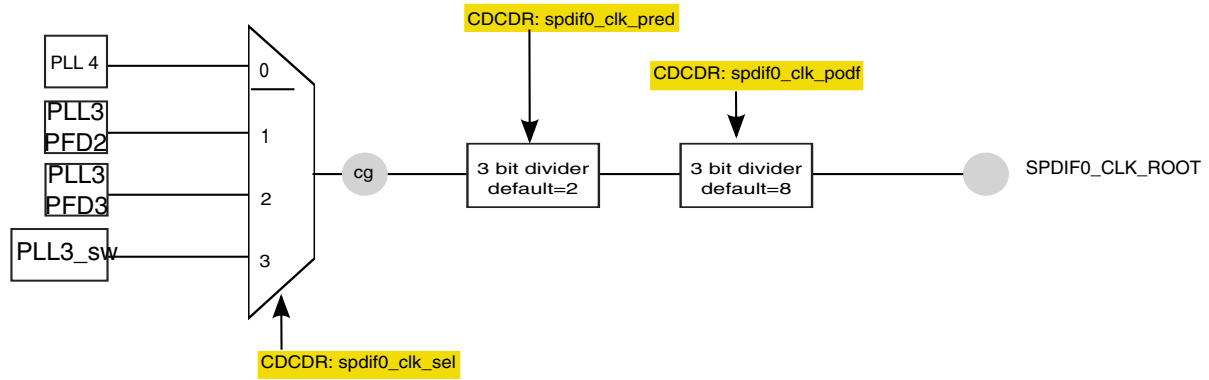

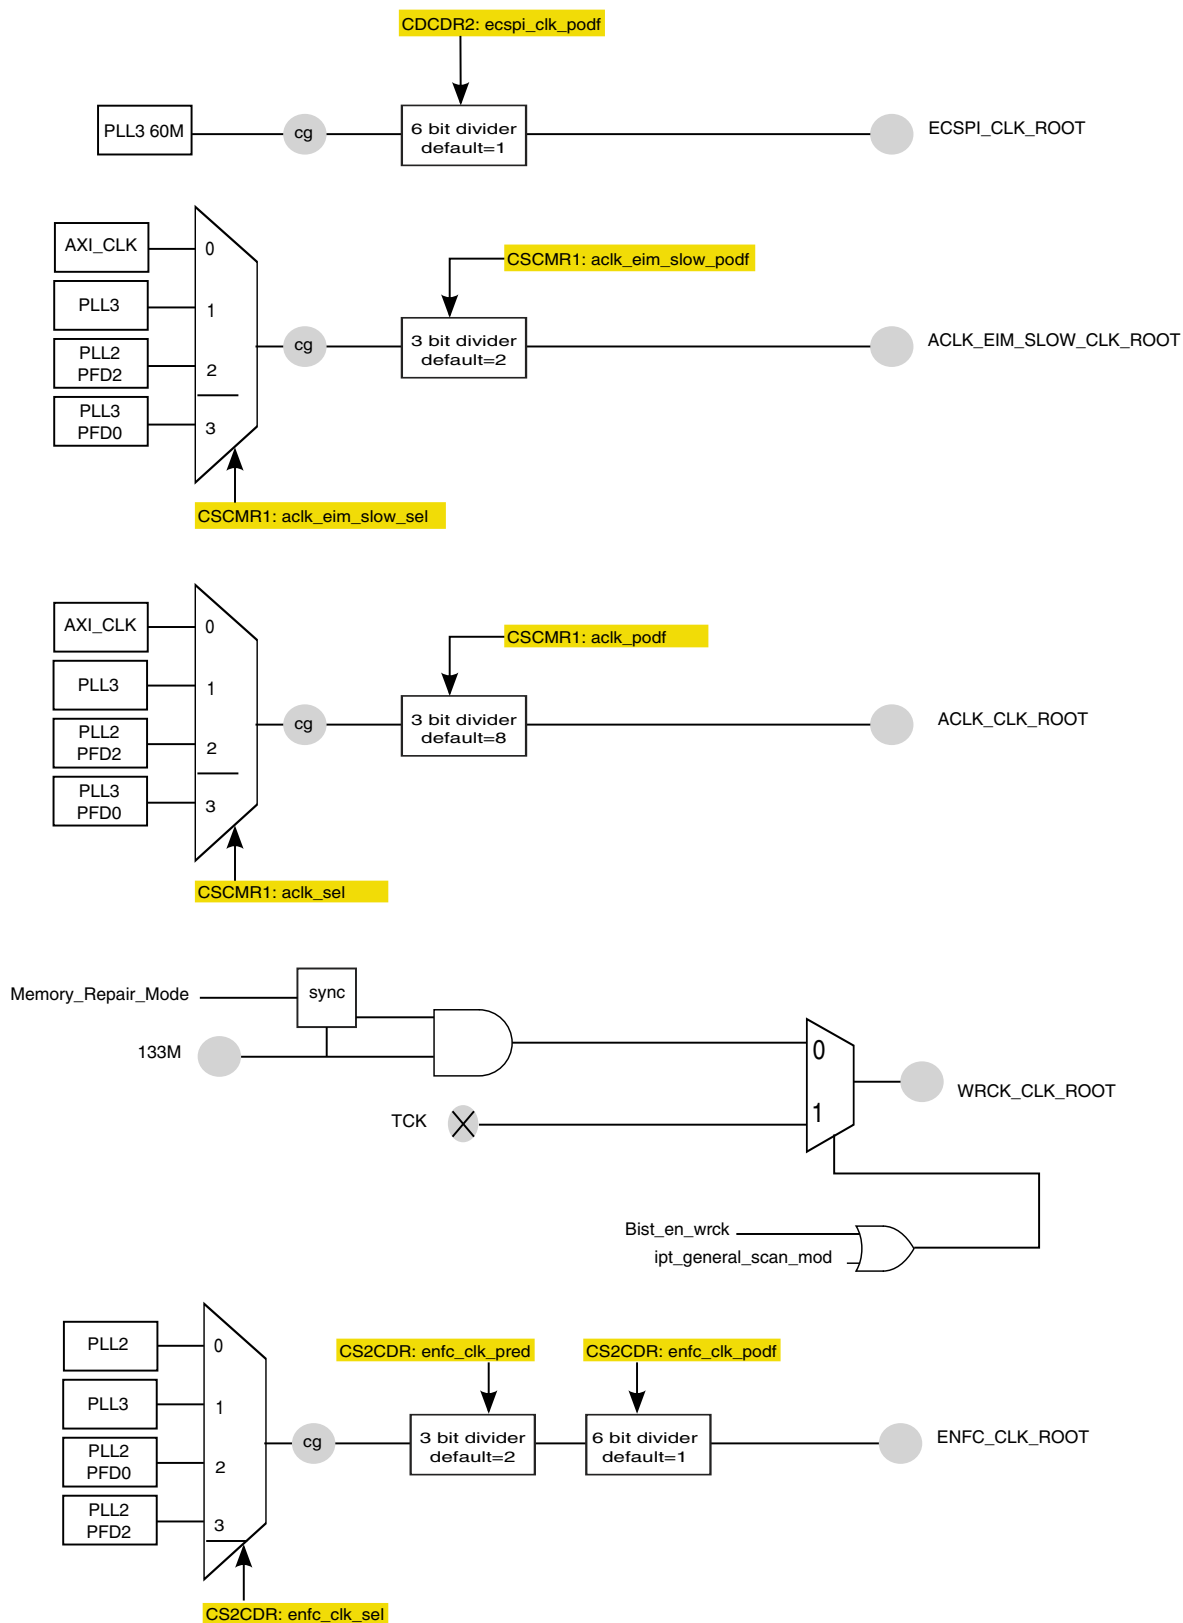

Figure 18-8. Serial clock generation (cont)

Functional Description

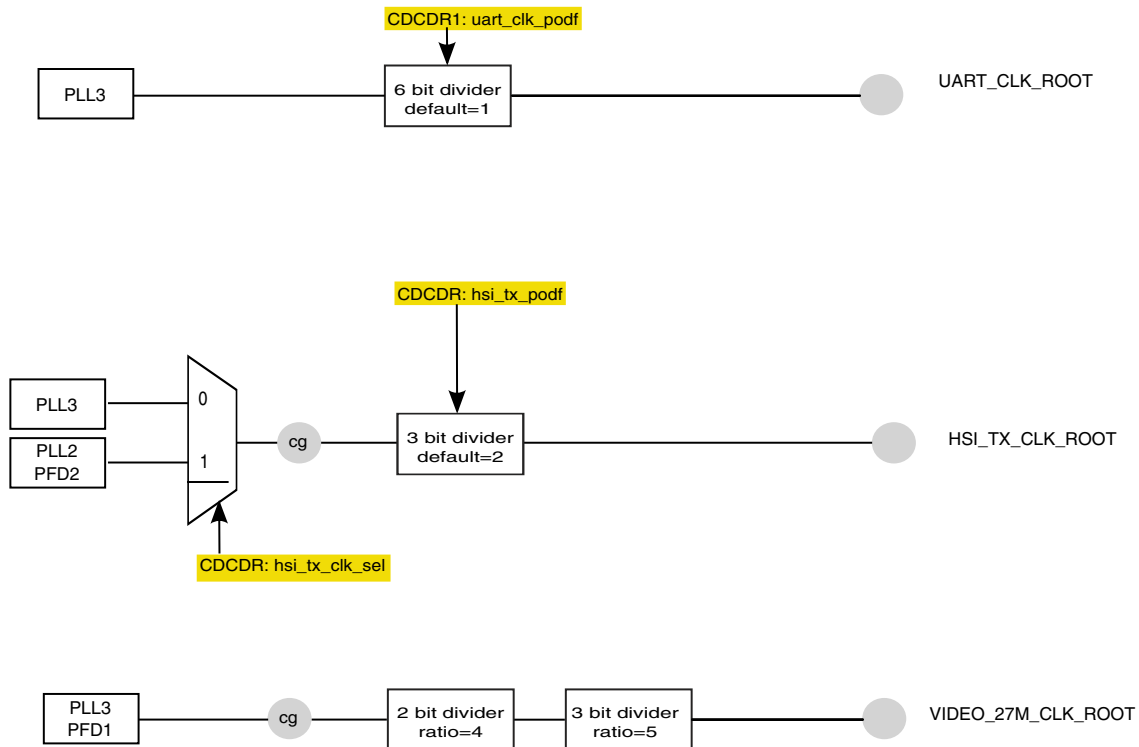

Figure 18-9. UART, HSI, Video clock generation (cont)

NOTE

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

18.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC).

The initial values of the following dividers and muxes can be controlled by SJC.

In regular functional mode, the SJC will drive the reset values stated in the CCM register memory map. If SJC is programmed to change those values, then the reset value for those dividers/muxes will be taken from the SJC programmability.

Software can update the changed reset value after reset sequence. The control signals and the dividers/muxes are listed below:

- [2:0] init_mmdc_ch1_axi_podf
- [2:0] init_periph2_clk2_podf
- [1:0] init_ipg_podf
- [2:0] init_ahb_podf

- [2:0] init_axi_podf
- [2:0] init_mmdc_ch0_axi_podf
- [2:0] init_periph_clk2_podf
- init_periph_clk_sel
- init_periph2_clk_sel

18.5.1.5.6 Divider change handshake

Modifying the following dividers will start the handshake with MMDC CH1 and/or CH0.

- mmdc_ch0_axi_podf
- mmdc_ch1_axi_podf
- periph_clk_sel
- periph2_clk_sel

18.5.1.6 Disabling / Enabling PLLs

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL. For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in [Figure 18-5](#). In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the FABRIC_CLK_ROOT away from the PLL2 or one of its PFDs by programming CBCMR[PERIPH2_CLK2_SEL] and CBCDR[PERIPH2_CLK2_PODF] to provide an appropriate frequency clock, then glitchlessly switch to it by programming CBCDR[PERIPH2_CLK_SEL].

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

18.5.1.7 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

1. Clock enable signal from CCM - this signal is generated by configuration of the CGR bits in CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC spec for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

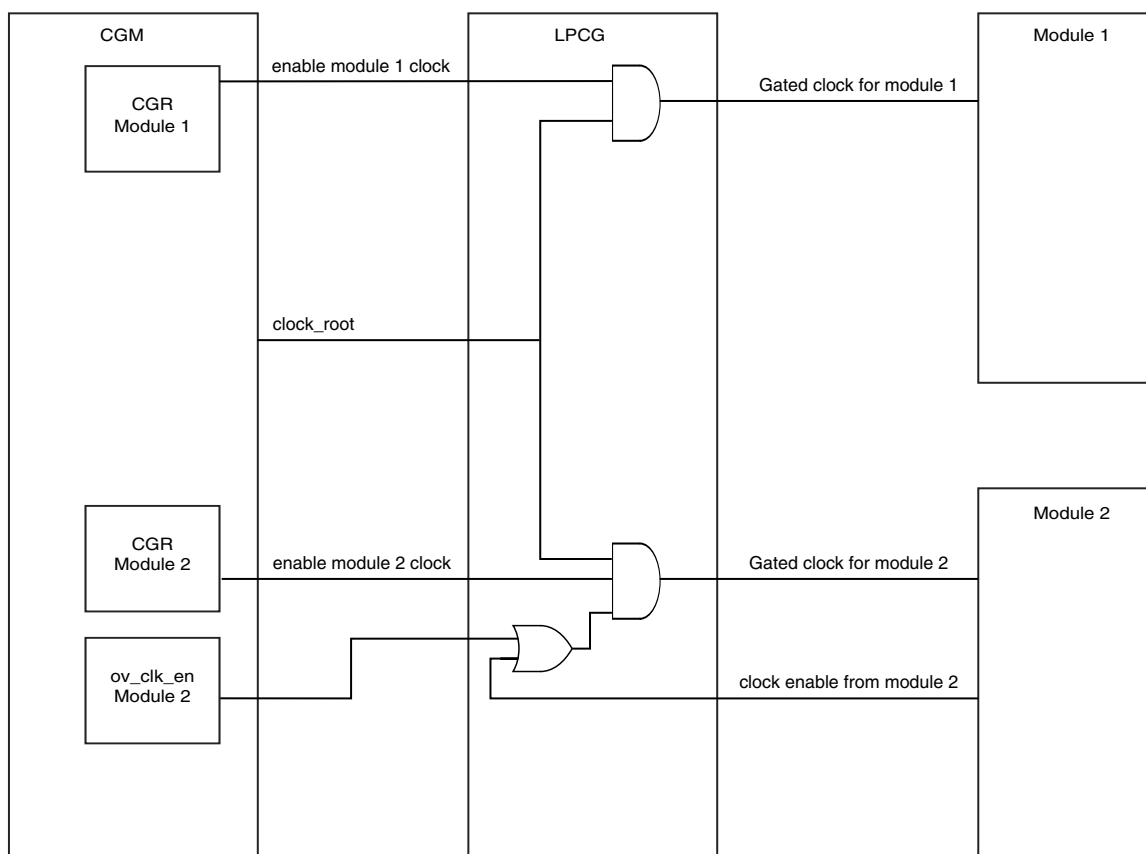

Figure 18-10. Clock split in LPCG

18.5.1.7.1 MMDC handshake

CCM will assert the `mmdc_freq_change_req` signal.

MMDC will assert the `mmdc0_freq_change_ack` and `mmdc1_freq_change_ack` signals to acknowledge that the frequency change request has been received and that the frequency can now be changed safely.

CCM will commence the actual change of division ratio of `mmdc0` and/or `mmdc1` dividers or apply mux change on root clocks once both of the non-masked acknowledges are asserted.

18.5.2 DVFS support

When performing DVFS, the frequency shift procedure for the ARM core clock domain can be performed by software.

CPU PLL frequency or CCM ARM clk divider and CPU power domain supply voltage value are controlled by the CCM_ANALOG module. Please note that frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

Frequency shift for MMDC requires hardware support.

18.5.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

18.5.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

18.5.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits.

18.5.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform. Gating of ARM clock will take place only if CLPCR[5]=1 and debug_arm_clk_off_on_lpm=0 (connected

to the SJC register sjc_gpucr3_reg bit 15). If either CLPCR[5]=0 or debug_arm_clk_off_on_lpm=1, the ARM clocks will not be gated off and CCM will continue to the next step.

The next actions can be programmed during WAIT mode:

1. CCM requests an acknowledge to close clocks to MMDC if its CGR bits indicate to close its clocks on WAIT mode, and if those clocks are not already closed in run mode. The request will be issued if the handshake is not bypassed by programming the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. Once CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.
3. Observability to indicate WAIT mode.

Any enabled interrupt assertion will start the exit from WAIT mode.

18.5.3.2.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

18.5.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating is applied for ARM platform, GPU3D, GPU2D and VPU. External supply voltage can be reduced to decrease leakage.

18.5.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- pmic_vstby_req asserted, if vstby bit is set
- osc_en signal is negated
- osc_pwrdsn is asserted, if sbyos bit is set

Counter will be triggered after `pmic_vstby_req` assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, `anatop_stop_mode` signal will be asserted, that will trigger disabling analog elements in `anatop`.

CCM's low power state machine will remain in state `STOP_GPC` until `STOP` mode is exited.

18.5.3.3.2 Exiting STOP mode

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting `STOP` mode.

The following will take place:

1. If `vstby` bit was set, deassert `PMIC_STBY_REQ` to notify power management IC to change voltage from standby voltage to functional voltage.
2. If well bias was enabled, deasserted well bias controls.
3. If `sbyos` was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting `ref_en_b` signal and deasserting `cosc_pwrdown` signal respectively.
4. After the amount of CKILs defined in `stby_count` bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
5. Start osc. If oscillator was started, wait until `oscnt` has finished its counting to make sure that oscillator is ready.
6. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to `STOP` mode will be started.
7. CCM will request GPC to restore ARM power by `GPC_PUP_REQ`. If power was removed from the ARM platform, GPC will notify CCM by asserting signal `GPC_PUP_ACK` that power to ARM is back on, and its safe to exit from `STOP` mode. Only then will the CCM progress to the next step.
8. Once assertion of notification from `src` that the resets for the power gated modules has been finished, (`src_power_gating_reset_done` is set) negate the low power request signals to all modules and enable all module clocks including ARM clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in `RUN` mode will not be opened; they will continued to be gated.)

Once the system is in run mode, negate signals `ccm_ipg_stop` and `system_in_stop_mode`.

18.6 CCM Memory Map/Register Definition

NOTE

CCM Register reset values may not be the same in ROM. See for more information.

CCM_CCR field descriptions

| Field | Description |
|---------------------------|---|
| 31–28 Reserved | This read-only field is reserved and always has the value 0. |
| 27 RBC_EN | Enable for REG_BYPASS_COUNTER. If enabled, analog_reg_bypass signal will be asserted after REG_BYPASS_COUNT clocks of CKIL, after standby voltage is requested. If standby voltage is not requested analog_reg_bypass won't be asserted, event if counter is enabled. 1 REG_BYPASS_COUNTER enabled. 0 REG_BYPASS_COUNTER disabled |
| 26–21 REG_BYPASS_COUNT | Counter for analog_reg_bypass signal assertion after standby voltage request by pmic_vstby_req. Should be zeroed and reconfigured after exit from low power mode. REG_BYPASS_COUNT can also be used for holding off interrupts when the PGC unit is sending signals to power gate the core. 000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock periods delay |
| 20–19 Reserved | This read-only field is reserved and always has the value 0. |
| 18–16 WB_COUNT | Well Bias counter. Delay, defined by this value, counted by CKIL clock will be applied till well bias is enabled at exit from wait or stop low power mode. Counter will be used if wb_core_at_lpm or wb_per_at_lpm bits are set. Should be zeroed and reconfigured after exit from low power mode. 000 no delay 001 1 CKIL clock delay 111 7 CKIL clocks delay |
| 15–13 Reserved | This read-only field is reserved and always has the value 0. |
| 12 COSC_EN | On chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on chip oscillator enabled to supply source for the PLLs. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then CCM will enable the on chip oscillator and after counting oscnt ckil clock cycles it will notify that on chip oscillator is ready by a interrupt cosc_ready and by status bit cosc_ready. The cosc_en bit should be changed only when on chip oscillator is not chosen as the clock source. 0 disable on chip oscillator 1 enable on chip oscillator |
| 11–8 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 7–0 OSCNT | Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in ignition sequence and in wake from stop sequence if sbyos bit was defined, to notify that on chip oscillator output is ready for the dp1l_ip to use and only then the gate in dp1l_ip can be opened. 00000000 count 1 ckil 11111111 count 256 ckil's (default) |

18.6.2 CCM Control Divider Register (CCM_CCDDR)

The figure below represents the CCM Control Divider Register (CCDR), which contains bits that control the loading of the dividers that need handshake with the modules they affect. The table below provides its field descriptions.

Address: 20C_4000h base + 4h offset = 20C_4004h

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------------|---------------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | | | | | | | | | | | | | | mmdc_ch0_mask | mmdc_ch1_mask |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

CCM_CCDDR field descriptions

| Field | Description |
|---------------------|---|
| 31–18 Reserved | This read-only field is reserved and always has the value 0. |
| 17 mmdc_ch0_mask | During divider ratio mmdc_ch0_axi_podf change or sync mux periph_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc_ch0 module. 0 allow handshake with mmdc_ch0 module 1 mask handshake with mmdc_ch0. Request signal will not be generated. |
| 16 mmdc_ch1_mask | During divider ratio mmdc_ch1_axi_podf change or sync mux periph2_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc_ch1 module. 0 allow handshake with mmdc_ch1 module 1 mask handshake with mmdc_ch1. Request signal will not be generated. |
| 15–0 Reserved | This read-only field is reserved and always has the value 0. |

18.6.3 CCM Status Register (CCM_CSR)

The figure below represents the CCM status Register (CSR). The status bits are read-only bits. The table below provides its field descriptions.

Address: 20C_4000h base + 8h offset = 20C_4008h

CCM_CSR field descriptions

| Field | Description |
|------------------|--|
| 31–6 Reserved | This read-only field is reserved and always has the value 0. |
| 5 cosc_ready | Status indication of on board oscillator. This bit will be asserted if on chip oscillator is enabled and on chip oscillator is not powered down, and if oscnt counter has finished counting. |

Table continues on the next page...

CCM_CSR field descriptions (continued)

| Field | Description |
|-----------------|---|
| | 0 on board oscillator is not ready. 1 on board oscillator is ready. |
| 4 Reserved | This read-only field is reserved and always has the value 1. |
| 3–1 Reserved | This read-only field is reserved and always has the value 0. |
| 0 REF_EN_B | Status of the value of CCM_REF_EN_B output of ccm 0 value of CCM_REF_EN_B is '0' 1 value of CCM_REF_EN_B is '1' |

18.6.4 CCM Clock Swither Register (CCM_CCSR)

The figure below represents the CCM Clock Switcher register (CCSR). The CCSR register contains bits to control the switcher sub-module dividers and multiplexers. The table below provides its field descriptions.

Address: 20C_4000h base + Ch offset = 20C_400Ch

| | | | | | | | | | | | | | | | | |

CCM_CCSR field descriptions

| Field | Description |
|-------------------|--|
| 31–16 Reserved | This read-only field is reserved and always has the value 0. |

Table continues on the next page...

CCM_CCSR field descriptions (continued)

| Field | Description |
|-------------------------|---|
| 15 pfd_540m_dis_mask | Mask of 540M PFD auto-disable. 0 - 540M PFD disable=0 (PFD always on) 1 540M PFD disable is managed by associated dividers disable. If all 540M-driven dividers are closed, PFD is disabled. |
| 14 pfd_720m_dis_mask | Mask of 720M PFD auto-disable. 0 720M PFD disable=0 (PFD always on) 1 720M PFD disable is managed by associated dividers disable. If all 720M-driven dividers are closed, PFD is disabled. |
| 13 pfd_454m_dis_mask | Mask of 454M PFD auto-disable. 0 454M PFD disable=0 (PFD always on) 1 454M PFD disable is managed by associated dividers disable. If all 454M-driven dividers are closed, PFD is disabled. |
| 12 pfd_508m_dis_mask | Mask of 508M PFD auto-disable. 0 508M PFD disable=0 (PFD always on) 1 508M PFD disable is managed by associated dividers disable. If all 508M-driven dividers are closed, PFD is disabled. |
| 11 pfd_594m_dis_mask | Mask of 594M PFD auto-disable. 0 594M PFD disable=0 (PFD always on) 1 594M PFD disable is managed by associated dividers disable. If all 594M-driven dividers are closed, PFD is disabled. |
| 10 pfd_352m_dis_mask | Mask of 352M PFD auto-disable. 0 352M PFD disable=0 (PFD always on) 1 352M PFD disable is managed by associated dividers disable. If all 352M-driven dividers are closed, PFD is disabled. |
| 9 pfd_396m_dis_mask | Mask of 396M PFD auto-disable. 0 396M PFD disable=0 (PFD always on) 1 396M PFD disable is managed by associated dividers disable. If all 396M-driven dividers are closed, PFD is disabled. |
| 8 step_sel | Selects the option to be chosen for the step frequency when shifting ARM frequency. This will control the step_clk. NOTE: This mux is allowed to be changed only if its output is not used, i.e. ARM uses the output of pll1, and step_clk is not used. 0 osc_clk (24M) - source for lp_apm. (default) 1 pll2 PFD clock |
| 7-3 Reserved | This read-only field is reserved and always has the value 0. |
| 2 pll1_sw_clk_sel | Selects source to generate pll1_sw_clk. 0 pll1_main_clk(default) 1 step_clk |

Table continues on the next page...

CCM_CCSR field descriptions (continued)

| Field | Description |
|----------------------|---|
| 1 pll2_sw_clk_sel | Selects source to generate pll2_sw_clk. This bit should only be used for testing purposes. 0 pll2_main_clk(default) 1 pll2 bypass clock |
| 0 pll3_sw_clk_sel | Selects source to generate pll3_sw_clk. This bit should only be used for testing purposes. 0 pll3_main_clk(default) 1 pll3 bypass clock |

18.6.5 CCM Arm Clock Root Register (CCM_CACRR)

The figure below represents the CCM Arm Clock Root register (CACRR). The CACRR register contains bits to control the ARM clock root generation. The table below provides its field descriptions.

Address: 20C_4000h base + 10h offset = 20C_4010h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

18.6.7 CCM Bus Clock Multiplexer Register (CCM_CBCMR)

The figure below represents the CCM Bus Clock Multiplexer Register (CBCMR). The CBCMR register contains bits to control the multiplexers that generate the bus clocks. The table below provides its field descriptions.

NOTE

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and

the respective clock is gated in LPCG. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

The change for arm_clk_sel should be done through sdma so that ARM will not use this clock during the change and the clock will be gated in LPCG.

18.6.8 CCM Serial Clock Multiplexer Register 1 (CCM_CSCMR1)

The figure below represents the CCM Serial Clock Multiplexer Register 1 (CSCMR1). The CSCMR1 register contains bits to control the multiplexers that generate the serial clocks. The table below provides its field descriptions.

NOTE

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and the clock is gated. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

18.6.10 CCM Serial Clock Divider Register 1 (CCM_CSCDR1)

The figure below represents the CCM Serial Clock Divider Register 1 (CSCDR1). The CSCDR1 register contains bits to control the clock generation sub-module dividers. The table below provides its field descriptions.

NOTE

Any change on the above dividers will have to be done while the module that its clock is affected is not functional and the affected clock is gated. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

CCM_CLPCR field descriptions

| Field | Description |
|----------------------|---|
| 31–28 Reserved | This read-only field is reserved and always has the value 0. |
| 27 mask_l2cc_idle | Mask L2CC IDLE for entering low power mode. NOTE: Assertion of all bits[27:22] will generate low power mode request 1 L2CC IDLE is masked 0 L2CC IDLE is not masked |
| 26 mask_scu_idle | Mask SCU IDLE for entering low power mode NOTE: Assertion of all bits[27:22] will generate low power mode request 1 SCU IDLE is masked 0 SCU IDLE is not masked |

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

| Field | Description |
|------------------------------|--|
| 25 mask_core3_wfi | Mask WFI of core3 for entering low power mode NOTE: Assertion of all bits[27:22] will generate low power mode request 1 WFI of core3 is masked 0 WFI of core3 is not masked |
| 24 mask_core2_wfi | Mask WFI of core2 for entering low power mode NOTE: Assertion of all bits[27:22] will generate low power mode request 1 WFI of core2 is masked 0 WFI of core2 is not masked |
| 23 mask_core1_wfi | Mask WFI of core1 for entering low power mode NOTE: Assertion of all bits[27:22] will generate low power mode request 1 WFI of core1 is masked 0 WFI of core1 is not masked |
| 22 mask_core0_wfi | Mask WFI of core0 for entering low power mode NOTE: Assertion of all bits[27:22] will generate low power mode request 0 WFI of core0 is not masked 1 WFI of core0 is masked |
| 21 bypass_mmdc_ch1_lpm_hs | Bypass handshake with mmdc_ch1 on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. Handshake also will be bypassed, if CGR3 CG10 is set to gate fast mmdc_ch1 clock. 0 Handshake with mmdc_ch1 on next entrance to low power mode will be performed. (Default.) 1 Handshake with mmdc_ch1 on next entrance to low power mode will be bypassed. |
| 20 Reserved | This read-only field is reserved and always has the value 0. |
| 19 bypass_mmdc_ch0_lpm_hs | Bypass handshake with mmdc_ch0 on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. Handshake will also be bypassed, if CGR3 CG10 is set to gate fast mmdc_ch0 clock. 0 Handshake with mmdc_ch0 on next entrance to low power mode will be performed. (default). 1 Handshake with mmdc_ch0 on next entrance to low power mode will be bypassed. |
| 18 Reserved | This read-only field is reserved and always has the value 0. |
| 17 - | This field is reserved. Reserved |
| 16 wb_per_at_lpm | Enable periphery charge pump for well biasing at low power mode (stop or wait) 0 Periphery charge pump won't be enabled at STOP or WAIT low power modes 1 Periphery charge pump will be enabled at STOP or WAIT low power modes |
| 15–12 Reserved | This read-only field is reserved and always has the value 0. |
| 11 cosc_pwrdown | In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on chip oscillator will be bypassed. |

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

| Field | Description |
|-------------------------|--|
| | <p>The manual closing of onchip oscillator should be performed only in case the reference oscillator is not the source of all the clocks generation.</p> <p>0 On chip oscillator will not be powered down, i.e. <code>cosc_pwrdown = '0'</code>. (default)</p> <p>1 On chip oscillator will be powered down, i.e. <code>cosc_pwrdown = '1'</code>.</p> |
| 10–9 stby_count | <p>Standby counter definition. These two bits define, in the case of stop exit (if <code>vstby</code> bit was set), the amount of time CCM will wait between <code>PMIC_VSTBY_REQ</code> negation and the check of assertion of <code>CCM_PMIC_READY</code>.</p> <p>NOTE: Clock cycles ratio depends on <code>pmic_delay_scaler</code>, defined by <code>CGPR[0]</code> bit.</p> <p>00 CCM will wait $(1 * pmic_delay_scaler) + 1$ ckil clock cycles</p> <p>01 CCM will wait $(3 * pmic_delay_scaler) + 1$ ckil clock cycles</p> <p>10 CCM will wait $(7 * pmic_delay_scaler) + 1$ ckil clock cycles</p> <p>11 CCM will wait $(15 * pmic_delay_scaler) + 1$ ckil clock cycles</p> |
| 8 VSTBY | <p>Voltage standby request bit. This bit defines if <code>PMIC_VSTBY_REQ</code> pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in STOP mode.</p> <p>0 Voltage will not be changed to standby voltage after next entrance to STOP mode. (<code>PMIC_VSTBY_REQ</code> will remain negated - '0')</p> <p>1 Voltage will be requested to change to standby voltage after next entrance to stop mode. (<code>PMIC_VSTBY_REQ</code> will be asserted - '1').</p> |
| 7 dis_ref_osc | <p><code>dis_ref_osc</code> - in run mode, software can manually control closing of external reference oscillator clock, i.e. generating '1' on <code>CCM_REF_EN_B</code> signal. If software closed manually the external reference clock, then sbyos functionality will be bypassed.</p> <p>The manual closing of external reference oscillator should be performed only in case the reference oscillator is not the source of any clock generation.</p> <p>NOTE: When returning from stop mode, the <code>PMIC_VSTBY_REQ</code> will be deasserted (if it was asserted when entering stop mode), and CCM will wait for indication that functional voltage is ready (by sampling the assertion of <code>pmic_vfunctional_ready</code>) before continuing the process of exiting from stop mode. See <code>stby_count</code> bits.</p> <p>0 external high frequency oscillator will be enabled, i.e. <code>CCM_REF_EN_B = '0'</code>. (default)</p> <p>1 external high frequency oscillator will be disabled, i.e. <code>CCM_REF_EN_B = '1'</code></p> |
| 6 SBYOS | <p>Standby clock oscillator bit. This bit defines if <code>cosc_pwrdown</code>, which power down the on chip oscillator, will be asserted in STOP mode. This bit is discarded if <code>cosc_pwrdown = '1'</code> for the on chip oscillator.</p> <p>0 On-chip oscillator will not be powered down, after next entrance to STOP mode. (<code>CCM_REF_EN_B</code> will remain asserted - '0' and <code>cosc_pwrdown</code> will remain de asserted - '0')</p> <p>1 On-chip oscillator will be powered down, after next entrance to STOP mode. (<code>CCM_REF_EN_B</code> will be deasserted - '1' and <code>cosc_pwrdown</code> will be asserted - '1'). (Default.) When returning from STOP mode, external oscillator will be enabled again, on-chip oscillator will return to oscillator mode, and after <code>oscnt</code> count, CCM will continue with the exit from the STOP mode process.</p> |
| 5 ARM_clk_dis_on_lpm | <p>Define if ARM clocks (<code>arm_clk</code>, <code>soc_mxclk</code>, <code>soc_pclk</code>, <code>soc_dbg_pclk</code>, <code>vl_wrck</code>) will be disabled on wait mode. This is useful for debug mode, when the user still wants to simulate entering wait mode and still keep ARM clock functioning.</p> <p>NOTE: Software should not enable ARM power gating in wait mode if this bit is cleared.</p> <p>0 ARM clock enabled on wait mode.</p> <p>1 ARM clock disabled on wait mode. (default).</p> |

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

| Field | Description |
|------------------------|--|
| 4–3 - | This field is reserved. Reserved |
| 2 bypass_pmic_ready | By asserting this bit CCM will bypass waiting for CCM_PMIC_READY signal when coming out of STOP mode. This should be used for PMIC's that don't support the CCM_PMIC_READY signal. 0 Don't bypass the CCM_PMIC_READY signal - CCM will wait for it's assertion during exit of low power mode if standby voltage was enabled. 1 bypass the CCM_PMIC_READY signal - CCM will not wait for it's assertion during exit of low power mode if standby voltage was enabled. |
| 1–0 LPM | Setting the low power mode that system will enter on next assertion of dsm_request signal. NOTE: Set CCM_CGPR[INT_MEM_CLK_LPM] and CCM_CGPR[1] bits to 1 when setting CCM_CLPCR[LPM] bits to 01 (WAIT Mode) or 10 (STOP mode) without power gating. CCM_CGPR[INT_MEM_CLK_LPM] and CCM_CGPR[1] bits do not have to be set for STOP mode entry. 00 Remain in run mode 01 Transfer to wait mode 10 Transfer to stop mode 11 Reserved |

18.6.19 CCM Interrupt Status Register (CCM_CISR)

The figure below represents the CCM Interrupt Status Register (CISR). This is a write one to clear register. Once a interrupt is generated, software should write one to clear it. The table below provides its field descriptions.

NOTE

CCM interrupt request 1 can be masked by CCM interrupt request 1 mask bit. CCM interrupt request 2 can be masked by CCM interrupt request 2 mask bit.

CCM.CGPR field descriptions

| Field | Description |
|-----------------------|---|
| 31–18 Reserved | This read-only field is reserved and always has the value 0. |
| 17 INT_MEM_CLK_LPM | Control for the Deep Sleep signal to the ARM Platform memories with additional control logic based on the ARM WFI signal. Used to keep the ARM Platform memory clocks enabled if an interrupt is pending when entering low power mode. NOTE: This bit should always be set when the CCM_CLPCR_LPM bits are set to 01(WAIT Mode) or 10 (STOP mode) without power gating. This bit does not have to be set for STOP mode entry. 0 Disable the clock to the ARM platform memories when entering Low Power Mode (Default) 1 Keep the clocks to the ARM platform memories enabled only if an interrupt is pending when entering Low Power Modes (WAIT and STOP without power gating) |
| 16 FPL | Fast PLL enable. |

Table continues on the next page...

CCM_CGPR field descriptions (continued)

| Field | Description |
|---------------------------------|---|
| | 0 Engage PLL enable default way. 1 Engage PLL enable 3 CKIL clocks earlier at exiting low power mode (STOP). Should be used only if 24MHz OSC was active in low power mode. |
| 15–9 Reserved | This read-only field is reserved and always has the value 1. |
| 8–7 Reserved | This read-only field is reserved and always has the value 0. |
| 6–5 Reserved | This read-only field is reserved and always has the value 1. |
| 4 efuse_prog_ supply_gate | Defines the value of the output signal cgpr_dout[4]. Gate of program supply for efuse programing 0 fuse programing supply voltage is gated off to the efuse module 1 allow fuse programing. |
| 3 - | This field is reserved. Reserved |
| 2 mmdc_ext_clk_ dis | Disable external clock driver of MMDC during STOP mode 1 disable during stop mode 0 don't disable during stop mode. |
| 1 - | Reserved. Keep default value set to '1' for proper operation. |
| 0 pmic_delay_ scaler | Defines clock division of clock for stby_count (pmic delay counter) 0 clock is not divided 1 clock is divided /8 |

18.6.23 CCM Clock Gating Register 0 (CCM_CCGR0)

CG(i) bits CCGR 0-6

These bits are used to turn on/off the clock to each module independently. The following table details the possible clock activity conditions for each module.

| CGR value | Clock Activity Description |
|-----------|---|
| 00 | Clock is off during all modes. Stop enter hardware handshake is disabled. |
| 01 | Clock is on in run mode, but off in WAIT and STOP modes |
| 10 | Not applicable (Reserved). |
| 11 | Clock is on during all modes, except STOP mode. |

Module should be stopped, before set its bits to "0"; clocks to the module will be stopped immediately.

The tables above show the register mappings for the different CGRs. The clock connectivity table should be used to match the "CCM output affected" to the actual clocks going into the modules.

The figure below represents the CCM Clock Gating Register 0 (CCM_CCGR0). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 7 CGR registers. The number of registers required is according to the number of peripherals in the system.

Address: 20C_4000h base + 68h offset = 20C_4068h

18.6.26 CCM Clock Gating Register 3 (CCM_CCGR3)

The figure below represents the CCM Clock Gating Register 3 (CCM_CCGR3). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 8 CGR registers. The number of registers required is determined by the number of peripherals in the system.

Address: 20C_4000h base + 74h offset = 20C_4074h

18.7 CCM Analog Memory Map/Register Definition

This section describes the registers for the analog PLLs. The registers which have the same description are grouped within { }. The register offsets for the various PLLs are:

- ARM PLL: {0h000, 0h004, 0h008, 0h00C}.
- USB1 PLL: {0h010, 0h014, 0h018, 0h01C}, {0h0F0, 0h0F4, 0h0F8, 0h0FC}.
- System PLL: {0h030, 0h034, 0h038, 0h03C}, 0h040, 0h050, 0h060, {0h100, 0h104, 0h108, 0h10C}.
- Audio / Video PLL: {0h070, 0h074, 0h078, 0h07C}, 0h080, 0h090, {0h0A0, 0h0A4, 0h0A8, 0h0AC}, 0h0B0, 0h0C0

18.7.1 Analog ARM PLL control Register (CCM_ANALOG_PLL_ARMn)

The control register provides control for the system PLL.

Address: 20C_8000h base + 0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_ARMn field descriptions

| Field | Description |
|------------|--|
| 31 LOCK | 1 - PLL is currently locked. 0 - PLL is not currently locked. |

Table continues on the next page...

CCM_ANALOG_PLL_ARMn field descriptions (continued)

| Field | Description |
|-------------------------|---|
| 30–20 - | Always set to zero (0). |
| 19 PLL_SEL | Reserved |
| 18 LVDS_24MHZ_SEL | Analog Debug Bit |
| 17 LVDS_SEL | Analog Debug Bit |
| 16 BYPASS | Bypass the pll. |
| 15–14 BYPASS_CLK_SRC | Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 CLK2 — Select the CLK2_N / CLK2_P as source. 0x3 XOR — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source. |
| 13 ENABLE | Enable the clock output. |
| 12 POWERDOWN | Powers down the PLL. |
| 11–7 - | This field is reserved. Reserved. |
| 6–0 DIV_SELECT | This field controls the pll loop divider. Valid range for divider value: 54-108. $F_{out} = F_{in} * div_select / 2.0$. |

18.7.2 Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1*n*)

The control register provides control for USBPHY0 480MHz PLL.

Address: 20C_8000h base + 10h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_USB1*n* field descriptions

| Field | Description |
|--------------|--|
| 31 LOCK | 1 - PLL is currently locked. 0 - PLL is not currently locked. |
| 30–17 - | Always set to zero (0). |
| 16 BYPASS | Bypass the pll. |

Table continues on the next page...

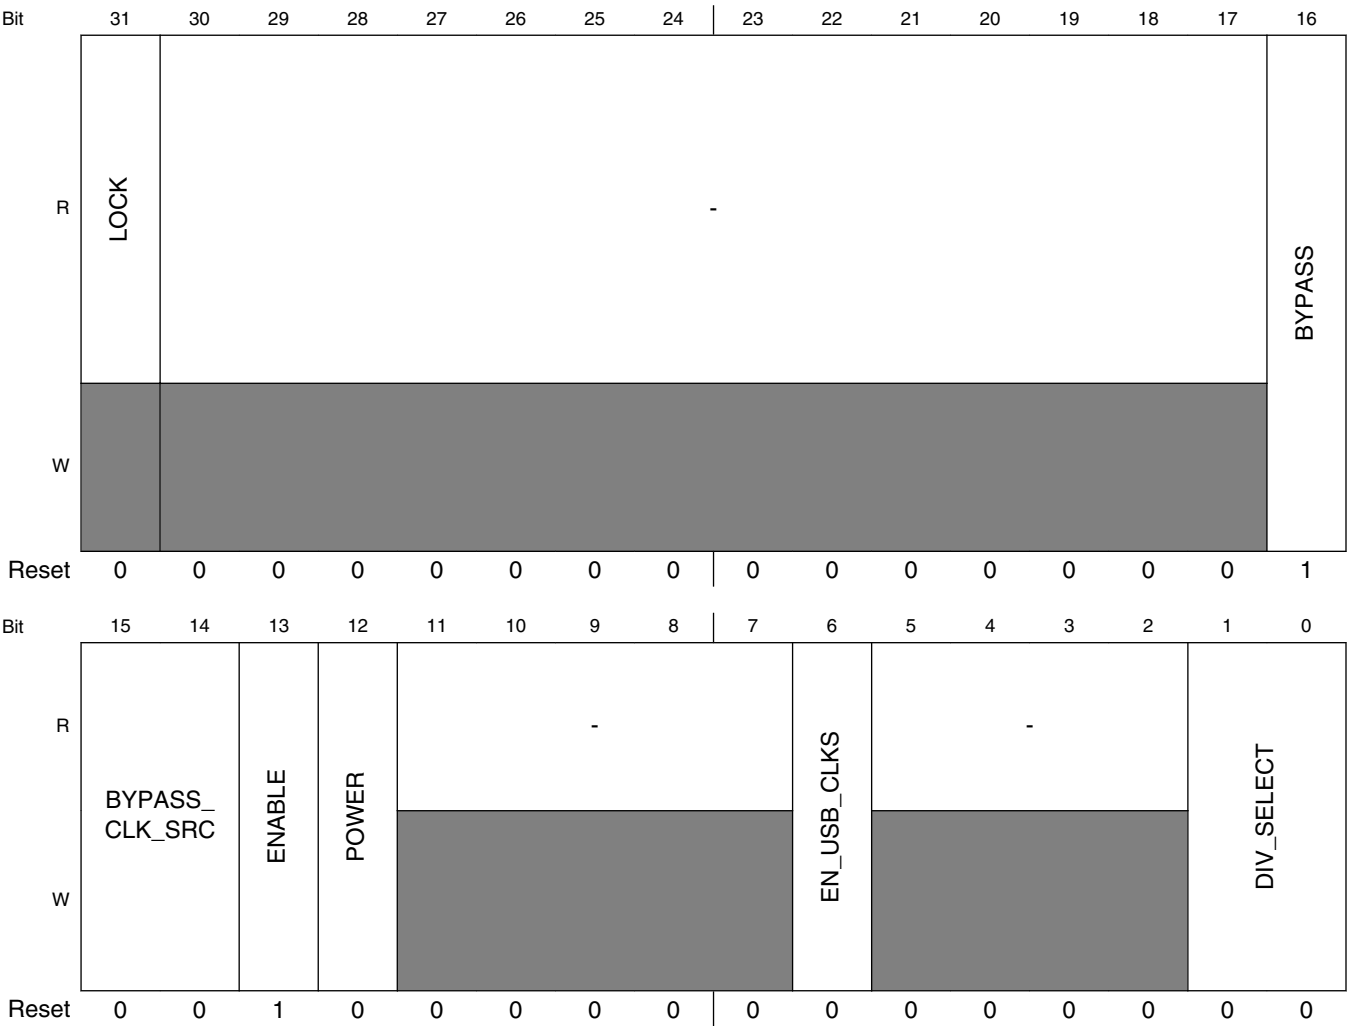

CCM_ANALOG_PLL_USB1_n field descriptions (continued)

| Field | Description |
|-------------------------|--|
| 15–14 BYPASS_CLK_SRC | Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 CLK2 — Select the CLK2_N / CLK2_P as source. 0x3 XOR — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source. |
| 13 ENABLE | Enable the PLL clock output. |
| 12 POWER | Powers up the PLL. This bit will be set automatically when USBPHY0 remote wakeup event happens. |
| 11–7 - | Always set to zero (0). |
| 6 EN_USB_CLKS | Powers the 9-phase PLL outputs for USBPHY _n . Additionally, the UTMI clock gate must be deasserted in the USBPHY _n to enable USB _n operation (clear CLKGATE bit in USBPHY _n _CTRL). This bit will be set automatically when USBPHY _n remote wakeup event occurs. 0 PLL outputs for USBPHY _n off. 1 PLL outputs for USBPHY _n on. |
| 5–2 - | Always set to zero (0). |
| 1–0 DIV_SELECT | This field controls the pll loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22. |

18.7.3 Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2n)

The control register provides control for USBPHY1 480MHz PLL.

Address: 20C_8000h base + 20h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_USB2n field descriptions

| Field | Description |
|--------------|--|
| 31 LOCK | 1 - PLL is currently locked. 0 - PLL is not currently locked. |
| 30–17 - | Always set to zero (0). |
| 16 BYPASS | Bypass the pll. |

Table continues on the next page...

CCM_ANALOG_PLL_USB2n field descriptions (continued)

| Field | Description |
|-------------------------|--|
| 15–14 BYPASS_CLK_SRC | Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 CLK2 — Select the CLK2_N / CLK2_P as source. 0x3 XOR — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source. |
| 13 ENABLE | Enable the PLL clock output. |
| 12 POWER | Powers up the PLL. This bit will be set automatically when USBPHY1 remote wakeup event happens. |
| 11–7 - | Always set to zero (0). |
| 6 EN_USB_CLKS | 0: 8-phase PLL outputs for USBPHY1 are powered down. If set to 1, 8-phase PLL outputs for USBPHY1 are powered up. Additionally, the utmi clock gate must be deasserted in the USBPHY1 to enable USB0 operation (clear CLKGATE bit in USBPHY1_CTRL). This bit will be set automatically when USBPHY1 remote wakeup event happens. |
| 5–2 - | Always set to zero (0). |
| 1–0 DIV_SELECT | This field controls the pll loop divider. 0 - $F_{out}=F_{ref}*20$; 1 - $F_{out}=F_{ref}*22$. |

18.7.4 Analog System PLL Control Register (CCM_ANALOG_PLL_SYSn)

The control register provides control for the 528MHz PLL.

Address: 20C_8000h base + 30h offset + (4d × i), where i=0d to 3d

Register 0: LOCK, PFD_OFFSET_EN, Reserved, BYPASS. Bit 31 is LOCK, bits 18-30 are LOCK, bits 17-16 are Reserved, bit 15 is BYPASS.

CCM_ANALOG_PLL_SYSn field descriptions

| Field | Description |
|-------------------------|---|
| 31 LOCK | 1 - PLL is currently locked; 0 - PLL is not currently locked. |
| 30–19 - | Always set to zero (0). |
| 18 PFD_OFFSET_EN | Enables an offset in the phase frequency detector. |
| 17 - | This field is reserved. Reserved |
| 16 BYPASS | Bypass the pll. |
| 15–14 BYPASS_CLK_SRC | Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 CLK2 — Select the CLK2_N / CLK2_P as source. 0x3 XOR — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source. |
| 13 ENABLE | Enable PLL output |
| 12 POWERDOWN | Powers down the PLL. |
| 11–7 - | This field is reserved. Reserved. |
| 6–1 - | Always set to zero (0). |
| 0 DIV_SELECT | This field controls the pll loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22. |

18.7.5 528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS)

This register contains the 528 PLL spread spectrum controls.

Address: 20C_8000h base + 40h offset = 20C_8040h

| | | | | | | | | | | | | | | | | |
|-------|--------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | STOP | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | ENABLE | STEP | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

CCM_ANALOG_PLL_SYS_SS field descriptions

| Field | Description |
|---------------|---|
| 31–16 STOP | Frequency change = stop/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz. |
| 15 ENABLE | 0 — Spread spectrum modulation disabled 1 — Spread spectrum modulation enabled |
| 14–0 STEP | Frequency change step = step/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz. |

18.7.6 Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM)

This register contains the numerator of 528MHz PLL fractional loop divider (signed number).

Absolute value should be less than denominator

Address: 20C_8000h base + 50h offset = 20C_8050h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | - | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | A | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

CCM_ANALOG_PLL_SYS_NUM field descriptions

| Field | Description |
|------------|---|
| 31–30 - | Always set to zero (0). |
| 29–0 A | 30 bit numerator (A) of fractional loop divider (signed integer). |

18.7.7 Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM)

This register contains the Denominator of 528MHz PLL fractional loop divider.

Address: 20C_8000h base + 60h offset = 20C_8060h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | - | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | B | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |

CCM_ANALOG_PLL_SYS_DENOM field descriptions

| Field | Description |
|------------|---|
| 31–30 - | Always set to zero (0). |
| 29–0 B | 30 bit Denominator (B) of fractional loop divider (unsigned integer). |

18.7.8 Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDION)

The control register provides control for the audio PLL.

Address: 20C_8000h base + 70h offset + (4d × i), where i=0d to 3d

| | | | | | | | | | | | | | | | | |
|-------|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

CCM_ANALOG_PLL_AUDION field descriptions

| Field | Description |
|--------------------------|---|
| 31 LOCK | 1 - PLL is currently locked. 0 - PLL is not currently locked. |
| 30–22 - | Always set to zero (0). |
| 21 SSC_EN | Reserved Bit |
| 20–19 POST_DIV_SELECT | These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved |
| 18 PFD_OFFSET_EN | Enables an offset in the phase frequency detector. |
| 17 - | This field is reserved. Reserved |
| 16 BYPASS | Bypass the pll. |
| 15–14 BYPASS_CLK_SRC | Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 CLK2 — Select the CLK2_N / CLK2_P as source. 0x3 XOR — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source. |

CCM_ANALOG_PLL_AUDIO_n field descriptions (continued)

| Field | Description |
|-------------------|--|
| 13 ENABLE | Enable PLL output |
| 12 POWERDOWN | Powers down the PLL. |
| 11–7 - | This field is reserved. Reserved. |
| 6–0 DIV_SELECT | This field controls the pll loop divider. Valid range for DIV_SELECT divider value: 27~54. |

18.7.9 Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM)

This register contains the numerator (A) of Audio PLL fractional loop divider.(Signed number), absolute value should be less than denominator

Absolute value should be less than denominator

Address: 20C_8000h base + 80h offset = 20C_8080h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

CCM_ANALOG_PLL_AUDIO_NUM field descriptions

| Field | Description |
|------------|--|
| 31–30 - | Always set to zero (0). |
| 29–0 A | 30 bit numerator of fractional loop divider. |

18.7.10 Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM)

This register contains the Denominator (B) of Audio PLL fractional loop divider. (unsigned number)

Address: 20C_8000h base + 90h offset = 20C_8090h

CCM_ANALOG_PLL_AUDIO_DENOM field descriptions

| Field | Description |
|------------|--|
| 31–30 - | Always set to zero (0). |
| 29–0 B | 30 bit Denominator of fractional loop divider. |

18.7.11 Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEOn)

The control register provides control for the Video PLL.

Address: 20C_8000h base + A0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_VIDEOn field descriptions

| Field | Description |
|--------------------------|---|
| 31 LOCK | 1 - PLL is currently locked; 0 - PLL is not currently locked. |
| 30–22 - | Always set to zero (0). |
| 21 SSC_EN | Reserved Bit |
| 20–19 POST_DIV_SELECT | These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved |
| 18 PFD_OFFSET_EN | Enables an offset in the phase frequency detector. |
| 17 - | This field is reserved. Reserved |
| 16 BYPASS | Bypass the pll. |
| 15–14 BYPASS_CLK_SRC | Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 CLK2 — Select the CLK2_N / CLK2_P as source. 0x3 XOR — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source. |

CCM_ANALOG_PLL_VIDEO_NUM field descriptions

| Field | Description |
|------------|--|
| 31–30 - | Always set to zero (0). |
| 29–0 A | 30 bit numerator of fractional loop divider(Signed number), absolute value should be less than denominator |

18.7.13 Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM)

This register contains the Denominator (B) of Video PLL fractional loop divider.
(Unsigned number)

Address: 20C_8000h base + C0h offset = 20C_80C0h

CCM_ANALOG_PLL_VIDEO_DENOM field descriptions

| Field | Description |
|------------|--|
| 31–30 - | Always set to zero (0). |
| 29–0 B | 30 bit Denominator of fractional loop divider. |

18.7.14 MLB PLL Control Register (CCM_ANALOG_PLL_MLBn)

This register defines the control bits for the MLB PLL.

Address: 20C_8000h base + D0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_MLBn field descriptions

| Field | Description |
|------------|---|
| 31 LOCK | Lock bit 0 PLL is not currently locked 1 PLL is currently locked. |

Table continues on the next page...

CCM_ANALOG_PLL_MLB_n field descriptions (continued)

| Field | Description |
|---------------------------|--|
| 30–29 - | This field is reserved. Reserved. |
| 28–26 MLB_FLT_RES_CFG | Configure the filter resistor for different divider ratio of MLB PLL. |
| 25–23 RX_CLK_DELAY_CFG | Configure the phase delay of the MLB PLL RX Clock. |
| 22–20 VDDD_DELAY_CFG | Configure the phase delay of the MLB PLL by adjusting the delay line in core Vdd poser domain. |
| 19–17 VDDA_DELAY_CFG | Configure the phase delay of the MLB PLL by adjusting the delay line in Vddio power domain. |
| 16 BYPASS | Bypass the PLL. |
| 15–14 - | This field is reserved. Reserved. |
| 13–12 PHASE_SEL | Analog debut bit. |
| 11 HOLD_RING_OFF | Analog debug bit. |
| 10–0 - | This field is reserved. Reserved. |

18.7.15 Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENETn)

The control register provides control for the ENET PLL.

Address: 20C_8000h base + E0h offset + (4d × i), where i=0d to 3d

| | | | | | | | | | | | | | | | | |
|-------|------|----|----|----|----|----|----|----|----|----|----|-------------|-------------|---------------|----------|--------|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | LOCK | | | | | | | | | | | ENABLE_100M | ENABLE_125M | PFD_OFFSET_EN | Reserved | BYPASS |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

CCM_ANALOG_PLL_ENET n field descriptions

| Field | Description |
|-------------------------|---|
| 31 LOCK | 1 - PLL is currently locked; 0 - PLL is not currently locked. |
| 30–21 - | Always set to zero (0). |
| 20 ENABLE_100M | Enables an offset in the phase frequency detector. |
| 19 ENABLE_125M | Enables an offset in the phase frequency detector. |
| 18 PFD_OFFSET_EN | Enables an offset in the phase frequency detector. |
| 17 - | This field is reserved. Reserved |
| 16 BYPASS | Bypass the pll. |
| 15–14 BYPASS_CLK_SRC | Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 CLK2 — Select the CLK2_N / CLK2_P as source. 0x3 XOR — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source. |
| 13 ENABLE | Enable the ethernet clock output. |
| 12 POWERDOWN | Powers down the PLL. |
| 11–7 - | This field is reserved. Reserved. |

Table continues on the next page...

CCM_ANALOG_PLL_ENET_n field descriptions (continued)

| Field | Description |
|-------------------|---|
| 6-2 - | Always set to zero (0). |
| 1-0 DIV_SELECT | Controls the frequency of the ethernet reference clock.00 - 25MHz; 01 - 50MHz; 10 - 100MHz (not 50% duty cycle); 11 - 125MHz; |

18.7.16 480MHz Clock (from PLL_USB2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480_n)

The PFD_480 control register provides control for PFD clock generation.

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 20C_8000h base + F0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PFD_480n field descriptions

| Field | Description |
|--------------------|---|
| 31 PFD3_CLKGATE | IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL is powered down |
| 30 PFD3_STABLE | This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state. |
| 29–24 PFD3_FRAC | This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD3_FRAC}$ where PFD3_FRAC is in the range 12–35. |
| 23 PFD2_CLKGATE | IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL is powered down |
| 22 PFD2_STABLE | This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state. |
| 21–16 PFD2_FRAC | This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD2_FRAC}$ where PFD2_FRAC is in the range 12–35. |
| 15 PFD1_CLKGATE | IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. Need to assert this bit before PLL is powered down |
| 14 PFD1_STABLE | This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, |

| 2–0 REG0_BO_ OFFSET | This field defines the brown out voltage offset for the CORE power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. Some steps may be irrelevant because of input supply limitations or load operation. NOTE: Not related to CCM. See Power Management Unit (PMU) for more information. 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V |

Chapter 19

MIPI CSI to IPU Gasket (CSI2IPU)

19.1 Overview

The CSI2IPU gasket is a digital core that functions as a gasket interface between the MIPI CSI-2 host controller and the IPU system. This facilitates communication between a MIPI CSI-2 compliant camera sensor and IPU (the image processing unit). The gasket's main functions are to synchronize the CSI-2 input 32-bit data bus with the 16-bit data bus and to separate the four virtual channels.

The following block diagram shows the CSI2IPU gasket's position in the system as part of the CSI to IPU connectivity.

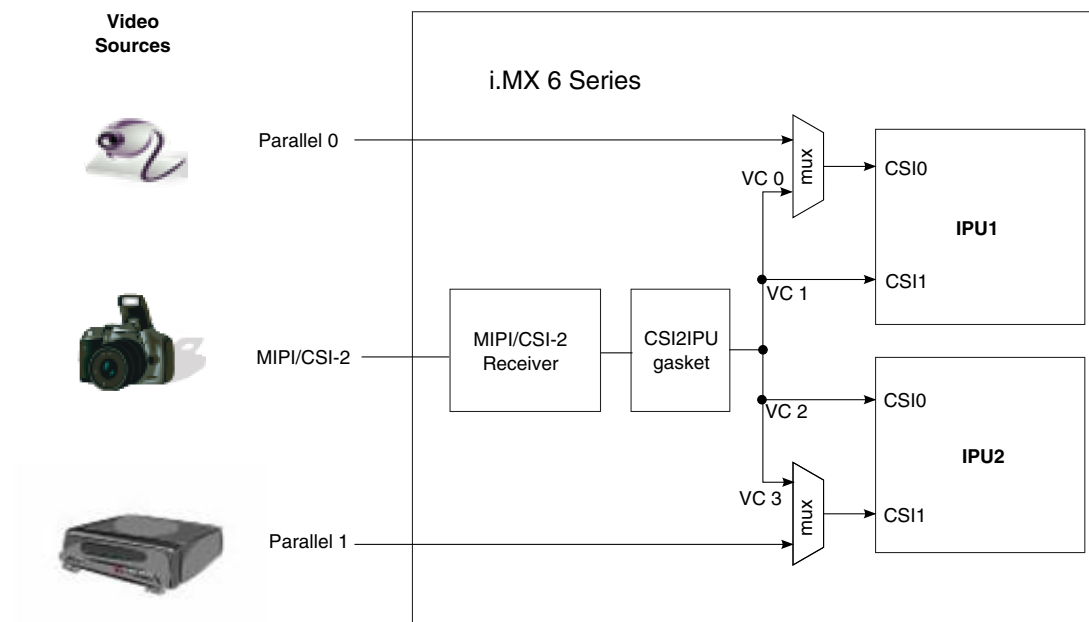

Figure 19-1. CSI2IPU gasket connectivity

19.1.1 CSI2IPU feature summary

The CSI2IPU gasket supports:

- Up to 4 virtual channels of MIPI CSI-2 host controller
- All data types of the MIPI Alliance Standard for Camera Serial Interface (CSI)
- Dynamically configurable pixel clock gating or non-gating for the IPU module
- Dynamically configurable RGB444 and YUV422 data format for the IPU module
- A software reset to reset the program during operation

19.1.2 CSI2IPU architectural description

The following figure shows the overall architecture of the CSI2IPU gasket.

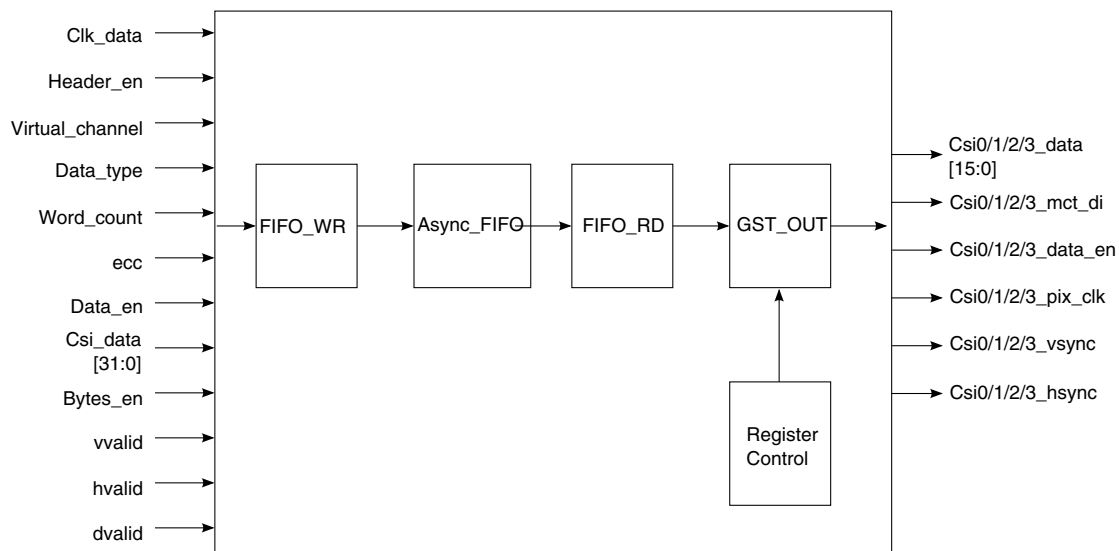

Figure 19-2. CSI2IPU gasket architecture

The main blocks are:

- **FIFO WRITE**—Responsible for receiving the CSI-2 host input signals and integrating them into a wr_data[46:0] bus
- **ASYNC FIFO**—Used to synchronize the wr_data to the read clock domain. It also generates FIFO full and empty signals.
- **FIFO READ**—Responsible for reading FIFO output and changing the 32-bit data bus to the 16-bit data bus.

- GST OUT—Generates output data according to the format controlled by the register bank.
- REGISTER CONTROL—register bank used to control the GST OUT block.

19.2 CSI2IPU signals

The following tables describe the CSI2IPU gasket's input and output signals.

Table 19-1. Input signals to CSI2IPU

| Signal | Description |
|----------------------|--|
| clk_data | Clock input for the CSI host controller |
| header_en | Shows that the header data at the input (signals virtual_channel, data_type, word_count, and ecc) is valid for the packet being transferred. This signal stays HIGH during the complete packet transfer. |
| virtual_channel[1:0] | Virtual channel identifier value <ul style="list-style-type: none"> • 00—VC0 • 01—VC1 • 10—VC2 • 11—VC3 |
| data_type[5:0] | <ul style="list-style-type: none"> • 00h–07h—Synchronization short packet data types • 08h–0Fh—Generic short packet data types • 10h–17h—Generic long packet data types • 18h–1Fh—YUV data • 20h–27h—RGB data • 28h–2Fh—RAW data • 30h–37h—User defined byte-based data • 38h–3Fh—Reserved |
| word_count[15:0] | 16-bit word count information from the packet header |
| ecc[7:0] | 8-bit error correction code for the packet header |
| data_en | Shows that new payload data is present at the input (signals csi_data and bytes_en). This signal is only asserted when receiving long packets. Note that the signal header_en is also asserted when data_en is asserted. |
| bytes_en[1:0] | Shows how many bytes are in the csi_data output signal <ul style="list-style-type: none"> • 00 = 1 valid byte in csi_data[7:0] • 01 = 2 valid bytes in csi_data[15:0] • 10 = 3 valid bytes in csi_data[23:0] • 11 = 4 valid bytes in csi_data[31:0] |
| vvalid[3:0] | This signal is asserted when a Frame Start is detected and de-asserted when a Frame End is detected. Each virtual channel has one valid signal. <ul style="list-style-type: none"> • vvalid[0]—vvalid for Virtual Channel 0 • vvalid[1]—vvalid for Virtual Channel 1 • vvalid[2]—vvalid for Virtual Channel 2 • vvalid[3]—vvalid for Virtual Channel 3 |

Table continues on the next page...

Table 19-1. Input signals to CSI2IPU (continued)

| Signal | Description |
|--------------------|---|
| hvalid[3:0] | This signal is asserted when a Line Start is detected and de-asserted when a Line End is detected. Line Start and Line End are optional; when they are not available, hvalid has the same behavior as dvalid. Each virtual channel has one valid signal. <ul style="list-style-type: none"> • hvalid[0]—hvalid for Virtual Channel 0 • hvalid[1]—hvalid for Virtual Channel 1 • hvalid[2]—hvalid for Virtual Channel 2 • hvalid[3]—hvalid for Virtual Channel 3 |
| dvalid[3:0] | Used to signal when valid data is available |
| csi_data_out[31:0] | Payload data |
| hw_resetrn | System hardware reset |
| sft_resetrn | System software reset from top module |
| gst_clk_sel | <ul style="list-style-type: none"> • 0—Gating clock mode • 1—Non-gating clock mode |
| gst_rgb444_fm | Rgb444 output format select <ul style="list-style-type: none"> • 0—{4'h0,r4g4b4} • 1—{r4,1'b0,g4,1'b0,b4,1'b0} |
| gst_yuv422_8bit_fm | Yuv422 output format select <ul style="list-style-type: none"> • 0—output YUYV • 1—output UYVY |
| ccm_pixel_clk | Reading clock from CCM |

Table 19-2. CSI2IPU output signals to IPU

Chapter 20

Display Content Integrity Checker (DCIC)

20.1 Overview

The goal of the DCIC is to verify that a safety-critical information sent to a display is not corrupted.

Such a verification is mandatory for warning icons in the instrument cluster of a car, to comply with the ASIL B (Automotive Safety Integrity Level B) specification. It is also required in other safety-sensitive systems.

Using external muxing DCIC can monitor either one of the IPU display port outputs or feedback signals going from IO pads of Parallel display interface. The figure below shows DCIC integration in system with two IPU blocks.

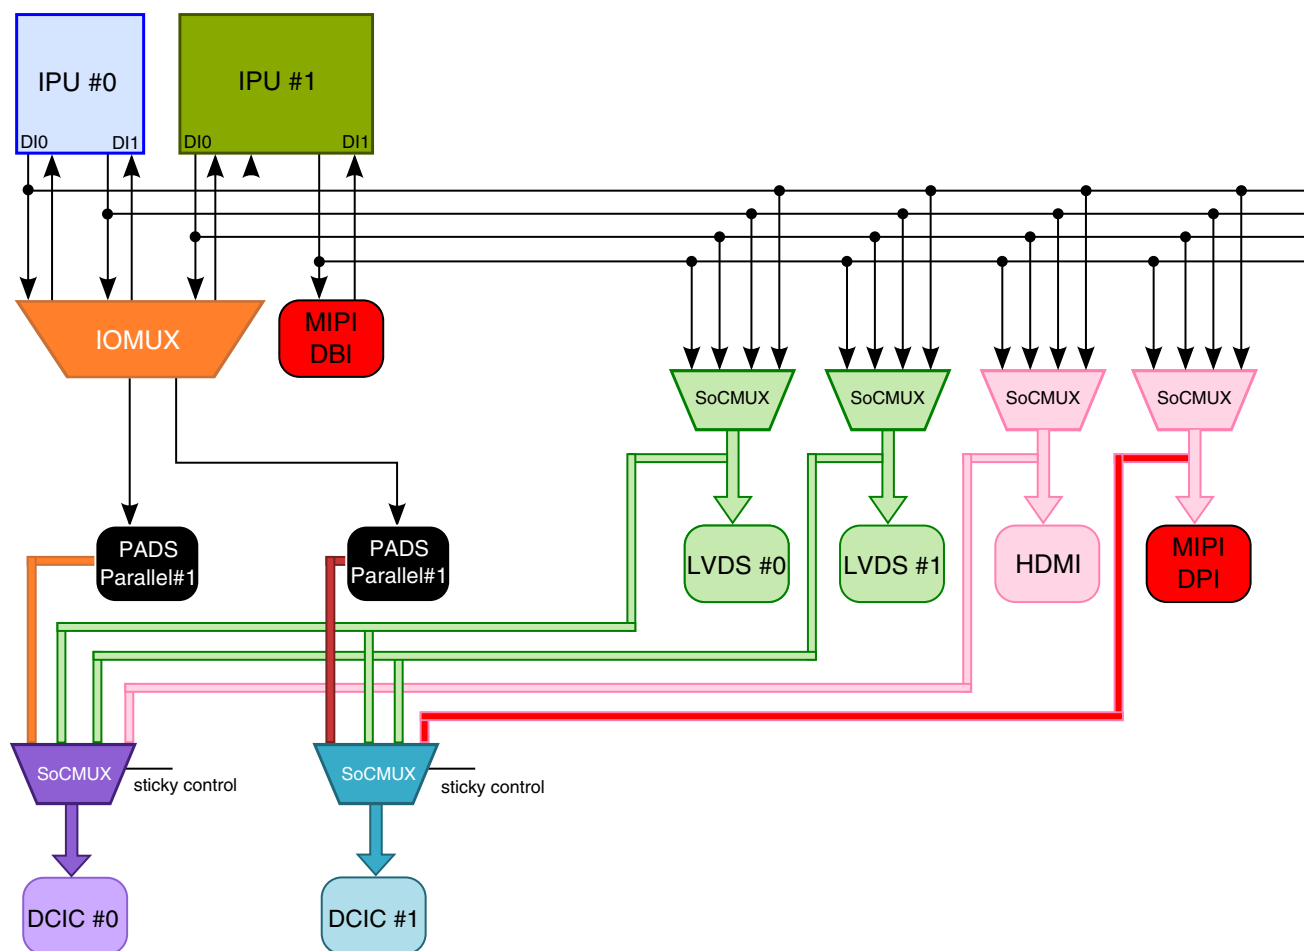

Figure 20-1. DCIC system integration example

20.1.1 Block Diagram

The figure below shows DCIC top level block diagram.

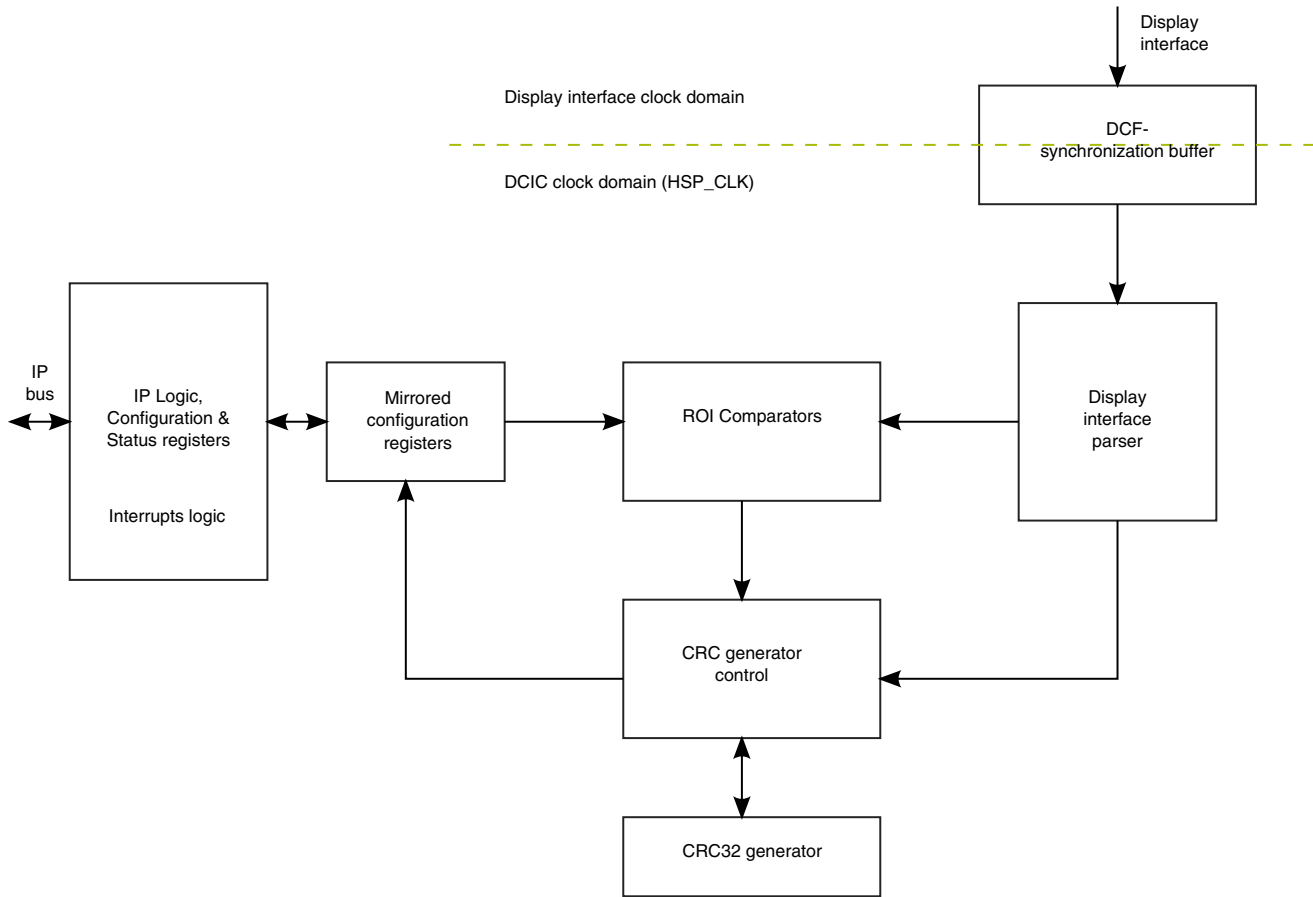

Figure 20-2. DCIC Block Diagram

20.1.2 Features

- Pixel clock up to 266 MHz
- Configurable polarity of Display Interface control signals
- 24-bit pixel data bus
- Up to 16 rectangular ROIs with a configurable location and size
- Independent CRC32 signature calculation for each ROI
- External controller mismatch indication signal

20.2 Functional Description

This section provides a complete functional description of the block.

20.2.1 Generic synchronous parallel display interface

The figure below depicts the LCD interface timing for a generic active matrix color TFT panel. In this figure signals are shown with negative polarity, but both polarity modes are supported by DCIC through configuration of appropriate bits of DCICCR register.

The sequence of events for active matrix interface timing is:

- IPP_DISP_CLK latches data into the panel on its negative edge (when positive polarity is selected). In active mode, IPP_DISP_CLK runs continuously.
- HSYNC causes the panel to start a new line.
- VSYNC causes the panel to start a new frame. It always encompasses at least one HSYNC pulse.
- DRDY acts like an output enable signal. This output enables the data to be shifted onto the display. When disabled, the data is invalid and the trace is off.

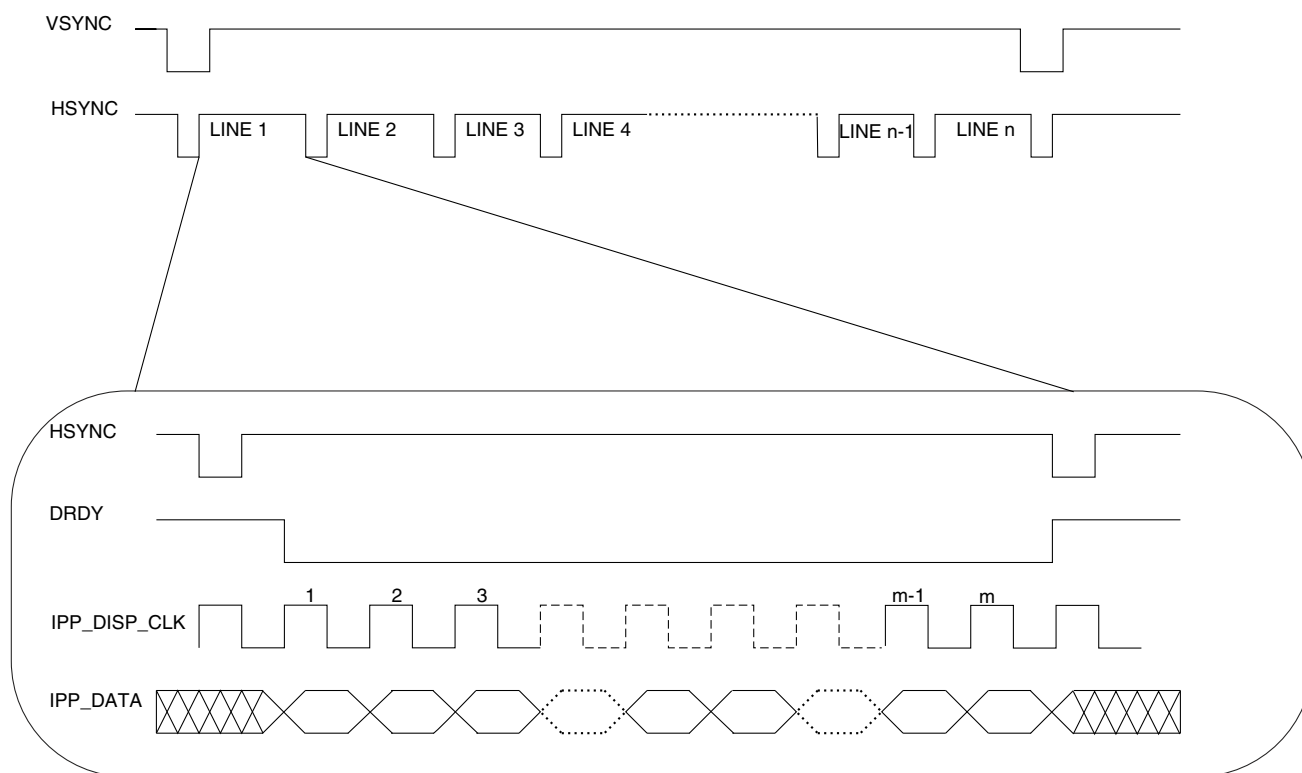

Figure 20-3. Interface Timing Diagram for TFT (Active Matrix) Panels

20.2.2 CRC Polynomial

DCIC uses the CRC32 polynomial to calculate the data signature.

Initial value for CRC calculation is 0x00000000.

$$X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$$

CRC generator uses XOR-ed combination of input data bits and previous result bits.

20.2.3 Mode of operation

After DCIC is configured and enabled, providing IPU display interface is already enabled, first VSYNC is being watched. VSYNC assertion zeroizes main position counters and initializes CRC storage registers.

Each HSYNC assertion after first line in frame that holds valid pixel data (non blanking) will signal new line, i.e. increment Y-counter and zeroize X-counter. Each valid data cycle (DATA_EN asserted) will increment X-counter. Thus X & Y values used to configure the module should be the coordinates on the actual visual part of the screen without blanking intervals. X & Y position counters are constantly compared to ROIs configuration. When current position matches one of the enabled ROIs, it triggers the enablement of CRC generator, which will use the current pixel data and previous pixel CRC result for this ROI. The result of the new calculation stored separately for each ROI. Next VSYNC, apart of signalling new frame start, will cause sampling calculated CRC values into configuration registers domain. These values then will be compared to expected signatures and appropriate status bits / interrupts will be asserted.

20.2.4 Interrupts

There are two maskable interrupts:

- Functional - Asserted when match results ready.
- Error - Asserted when there is a signature mismatch.

Both interrupts are generated immediately after completing the signature match check. Software should clean the interrupts by writing "1" to appropriate status bits (FI_STAT, ROI_MATCH_STAT). EI_STAT bit is a result of OR between all ROI_MATCH_STAT bits, hence it will be cleared automatically when these bits are clear.

Interrupt masks can be set/reset only while FREEZE_MASK bit isn't set. This bit can not be set back to zero.

20.2.5 Software reset

Disabling and enabling the module operation (IC_EN bit, [DCIC Control Register \(DCIC_DCICC\)](#)) will reset all the logic apart of configuration registers domain. Status bits of DCICS ([DCIC Status Register \(DCIC_DCICS\)](#)) register will also be cleared.

20.2.6 Clock domains

Asynchronous FIFO is being used to sample raw display interface signals and transfer them into DCIC fast clock domain (hsp_clk).

Display interface clock is always slower than DCIC fast clock.

IP registers are driven by the same fast clock and will be synchronized to system IP Bus clock by external IP_SYNC module.

20.2.7 External controller mismatch indication signal

Besides of interrupts to SoC core, DCIC provides an additional mismatch indication for external controller. The signal, if enabled, continuously oscillating at a rate which is an integer division of the main clock (hsp clock).

- When the status bit of the mismatch interrupt is set - i.e. from mismatch detection until the CPU clears the bit: division x16
- Otherwise: division x4

The indication signal is idle while integrity check is disabled.

20.2.8 Power saving

Disabling the module by clearing IC_EN bit will stop all module activities, including sampling of input signals into the FIFO.

20.2.9 System Considerations

- The DCIC always assumes a 24-bit pixel. For proper functionality with lower color depth, one must ensure that:
 - When the CPU calculates the reference signature, it applies the same mapping of a pixel to a 24-bit field as that performed by the IPU.

- The display is connected to the appropriate pins.
- The simplest mapping would be
 - Map the pixel to the data bus in the same way as for 24 bpp
 - Set the values at the extra LSBs to zero.
- Parameter updates
 - The reference signature can be freely updated from frame to frame, in coordination with the changing content (since it is used only once per frame, just before the interrupt)
 - Each ROI can be freely and independently enabled/disabled between frames (since the enable bit is double buffered)
 - The size and location of a ROI can be modified while it is disabled.
 - Display interface signals polarity can be changed only when the module is disabled.
- ROI (regions of interest) don't overlap, i.e. each pixel belongs to single ROI at most.
- DCIC operation is intended for monitoring relatively static portions of graphic interface, otherwise it will be complicated software task to keep up with frame synchronization and update expected signature for each frame.
- There should be no processing done at IPU on monitored ROIs, which can't be taken in consideration by software when calculating the expected signature.

20.3 DCIC Memory Map/Register Definition

Important: All write accesses have to be full word (32-bit) accesses. No error/abort will be responded in case of different access size, but no data will be written. Similarly, there will be no error response in case of access to undefined memory space.

Read access will return 32-bit data, which may be truncated on system level in case it wasn't full word acces.

DCIC memory map

|-----------------------|---|
| 31–28 Reserved | This read-only field is reserved and always has the value 0. |
| 27–16 END_OFFSET_Y | Row number of ROIs lower-right corner (Y coordinate) Range: 1 to $2^{12}-1$ |
| 15–13 Reserved | This read-only field is reserved and always has the value 0. |
| 12–0 END_OFFSET_X | Column number of ROIs lower-right corner (X coordinate) Range: 1 to $2^{13}-1$ |

20.3.7 DCIC ROI Reference Signature Register m (DCICx_DCICRRS)

Address: Base address + 18h offset

DCICx_DCICRRS field descriptions

| Field | Description |
|---------------------------------|---|
| 31–0 REFERENCE_ SIGNATURE | 32-bit expected signature (CRC calculation result) for ROI #m |

20.3.8 DCIC ROI Calculated Signature m (DCICx_DCICRCS)

Address: Base address + 1Ch offset

DCICx_DCICRCS field descriptions

| Field | Description |
|----------------------------------|---|
| 31–0 CALCULATED_ SIGNATURE | 32-bit actual signature (CRC calculation result) for ROI #m during the last frame. Updated automatically at the beginning of a next frame. |

Chapter 21

Enhanced Configurable SPI (ECSPI)

21.1 Overview

The Enhanced Configurable Serial Peripheral Interface (ECSPI) is a full-duplex, synchronous, four-wire serial communication block.

The ECSPI contains a 64 x 32 receive buffer (RXFIFO) and a 64 x 32 transmit buffer (TXFIFO). With data FIFOs, the ECSPI allows rapid data communication with fewer software interrupts. The figure below shows a block diagram of the ECSPI.

Figure 21-1. ECSPI Block Diagram

21.1.1 Features

Key features of the ECSPI include:

- Full-duplex synchronous serial interface
- Master/Slave configurable
- Four Chip Select (SS) signals to support multiple peripherals
- Transfer continuation function allows unlimited length data transfers
- 32-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SS) and SPI Clock (SCLK) are configurable
- Direct Memory Access (DMA) support
- Max operation frequency up to the reference clock frequency.

21.1.2 Modes and Operations

The ECSPI supports the modes described in the indicated sections:

- [Master Mode](#)
- [Slave Mode](#)
- [Low Power Modes](#)

As described in [Operations](#), the ECSPI supports the operations described in the indicated sections:

- [Typical Master Mode](#)
 - [Master Mode with SPI_RDY](#)
 - [Master Mode with Wait States](#)
 - [Master Mode with SS_CTL\[3:0\] Control](#)
 - [Master Mode with Phase Control](#)
- [Typical Slave Mode](#)

21.2 External Signals

The following table describes the external signals of ECSPI:

Table 21-1. ECSPI1 External Signals

| Signal | Description | Pad | Mode | Direction |
|--------------------|--------------------------------|-------------|------|-----------|
| ECSPI1_MISO (MISO) | Master data in; slave data out | CSI0_DAT6 | ALT2 | IO |

Figure 21-2 shows the ECSPI in master mode connected to four external devices in a one-way communication link.

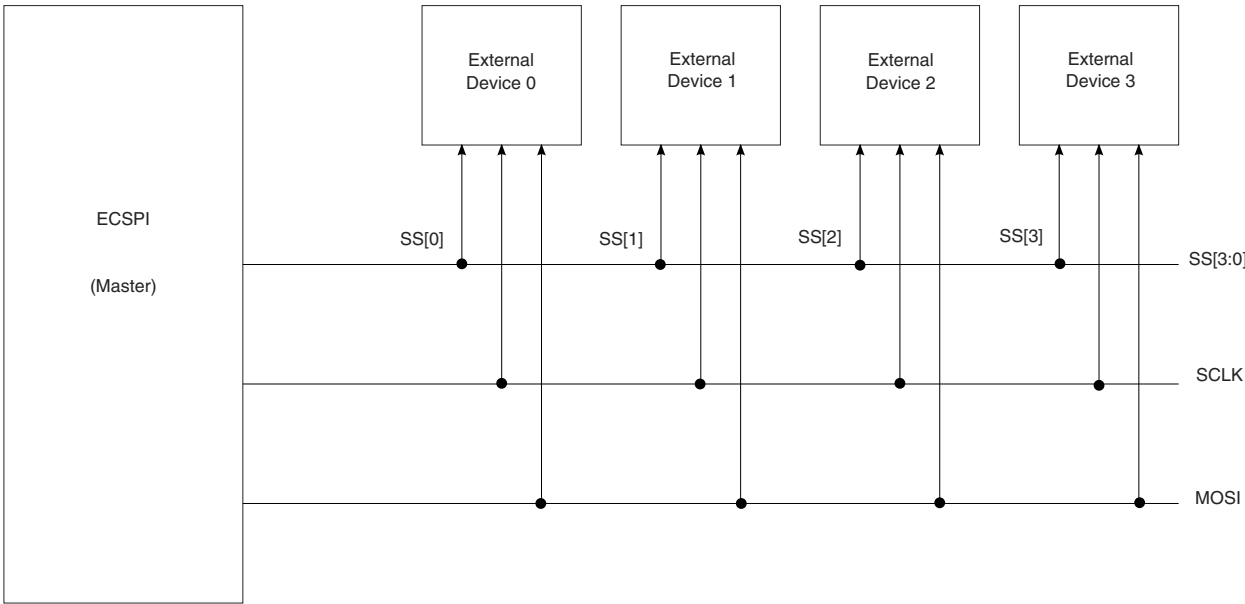

Figure 21-2. Example Connection Diagram

21.3 Clocks

The following table describes the clock sources for eCSPI. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 21-6. eCSPI Clocks

| Clock name | Clock Root | Description |
|-------------|--------------------|---------------------------------------|
| ipg_clk | ipg_clk_root | Peripheral clock |
| ipg_clk_32k | ckil_sync_clk_root | Low-frequency reference clock (32kHz) |
| ipg_clk_per | ecspi_clk_root | eCSPI module clock |
| ipg_clk_s | ipg_clk_root | Peripheral access clock |

21.4 Functional Description

This section provides a complete functional description of the ECSPI. The figure found here shows the relationship of SCLK and data lines while ECSPI has been configured with different POL and PHA settings.

Figure 21-3. ECSPI SCLK, MISO, and MOSI Relationship

21.4.1 Master Mode

When the ECSPI is configured as a master, it uses a serial link to transfer data between the ECSPI and an external slave device.

One of the Chip Select (SS) signals and the clock signal (SCLK) are used to transfer data between two devices. If the external device is a transmit-only device, the ECSPI master's output port can be ignored and used for other purposes. In order to use the internal TXFIFO and RXFIFO, two auxiliary output signals, Chip Select (SS) and SPI_RDY, are used for data transfer rate control. Software can also configure the sample period control register to a fixed data transfer rate.

21.4.2 Slave Mode

When the ECSPI is configured as a slave, software can configure the ECSPI Control register to match the external SPI master's timing.

In this configuration, Chip Select (\overline{SS}) becomes an input signal, and is used to control data transfers through the Shift register, as well as to load/store the data FIFO.

Slave mode only supports the case when SSCTL (SSB_CTRL[x] bit) is cleared. The accurate burst length should always be specified using the BURST_LENGTH parameter. SSCTL (SSB_CTRL[x] bit) set to 1 is not supported in slave mode.

21.4.3 Low Power Modes

The ECSPI does not operate under low power mode.

It holds its operation when its clock is gated off in master mode. In slave mode, the ECSPI does not respond when its clock is gated off.

21.4.4 Operations

The information found here describes the ECSPI's operations.

21.4.4.1 Typical Master Mode

The ECSPI master uses the Chip Select (SS) signal to enable an external SPI device, and uses the SCLK signal to transfer data in and out of the Shift register.

The SPI_RDY enables fast data communication with fewer software interrupts. By programming the ECSPI_PERIODREG register accordingly, the ECSPI can be used for a fixed data transfer rate.

When the ECSPI is in Master mode the SS, SCLK, and MOSI are output signals, and the MISO signal is an input.

Figure 21-4. Typical SPI Burst (8-bit Transfer)

In the above figure, the Chip Select (SS) signal enables the selected external SPI device, and the SCLK synchronizes the data transfer. The MOSI and MISO signals change on rising edge of SCLK and the MISO signal is latched on the falling edge of the SCLK. The figure above shows a data of 0xD2 is shifted out, and a data of 0x66 is shifted in.

21.4.4.1.1 Master Mode with SPI_RDY

By default, the ECSPI does not use the SPI_RDY signal in master mode (MODE = 1).

A SPI burst begins when the following events happen:

- The ECSPI is enabled, TXFIFO has data in it, and ECSPI_CONREG[XCH] bit or the ECSPI_CONREG[SMC] bit is set.
- When the SPI Data Ready Control (ECSPI_CONREG[DRCTL]) bits contains either 01 or 10, the SPI_RDY signal controls when a SPI burst starts.

A SPI burst is defined as a bus transaction that starts when the slave select is asserted and ends when the slave select is negated. The Chip Select (SS) signal will remain asserted until all the bits in a SPI burst are shifted out.

If ECSPI_CONREG[DRCTL] is set to 01, the SPI burst can be triggered only if a falling edge of the SPI_RDY signal has been detected.

The following figure shows the relationship between a SPI burst and the falling edge of SPI_RDY signal.

Figure 21-5. Relationship Between a SPI Burst and SPI_RDY: Falling-Edge Triggered

A SPI burst does not start until the falling edge of the SPI_RDY signal is detected. The next SPI burst starts when the next SPI_RDY falling edge is detected, after the last burst has finished.

If SPI Data Ready Control (ECSPI_CONREG[DRCTL]) is set to 10, the SPI burst can be triggered only if the SPI_RDY signal is low.

The following figure shows the relationship between a SPI burst and the SPI_RDY signal. The SPI burst does not begin until the SPI_RDY signal goes low. The ECSPI will keep transmitting SPI burst if the SPI_RDY signal remains low.

Figure 21-6. Relationship Between a SPI Burst and SPI_RDY: Low-Level Triggered

21.4.4.1.2 Master Mode with Wait States

Wait states can be inserted between SPI bursts. This provides a way for software to slow down the SPI burst to meet the timing requirements of a slower SPI device.

The following figure shows wait states inserted between SPI bursts.

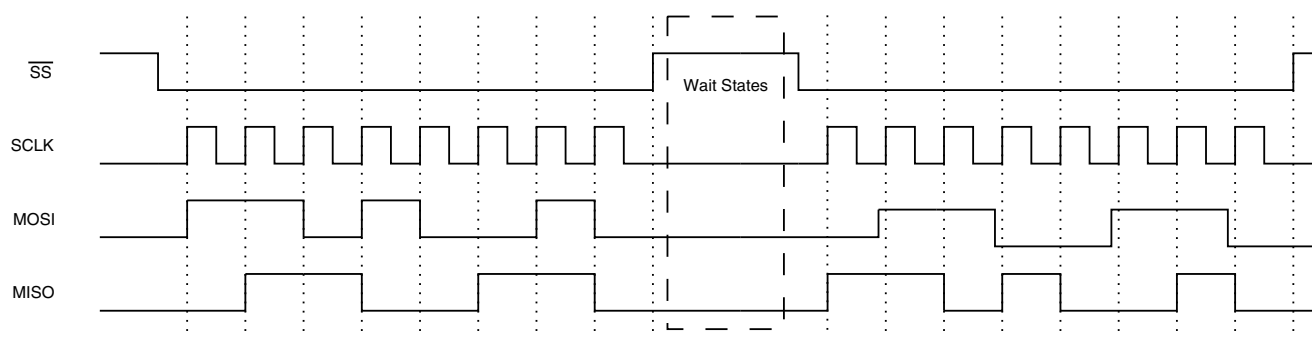

Figure 21-7. SPI Bursts with Wait States

In this case, the number of wait states is controlled by ECSPI_PERIODREG[SAMPLE PERIOD] and the wait states' clock source is selected by ECSPI_PERIODREG[CSRC].

21.4.4.1.3 Master Mode with SS_CTL[3:0] Control

The SPI SS Control (SS_CTL[3:0]) controls whether the current operation is single burst or multiple bursts.

When the SPI SS Wave Form Select (SS_CTL[3:0]) is set, the current operation is multiple bursts transfer. When the SPI SS Wave Form Select (SS_CTL[3:0]) bit is cleared, the current operation is single burst transfer. A SPI burst can contains multiple words as defined in the BURST LENGTH field of the ECSPI_CONREG register.

Figure 21-8. SPI Burst While SS_CTL[3:0] is Clear

In [Figure 21-8](#), two 8-bit bursts in the TXFIFO have been combined and transmitted in one SPI burst. The maximum length of a single SPI burst is defined in the BURST LENGTH field of the ECSPI_CONREG control register. ([Figure 21-8](#) corresponds to a BURST LENGTH of 8.) This provides a way for transferring a longer SPI burst by writing data into TXFIFO while the ECSPI is transmitting.

Figure 21-9. SPI Bursts While SS_CTL[3:0] is Set

In [Figure 21-9](#), two FIFO entries are transmitted, one entry with each SPI burst. The ECSPI will continue to transmit SPI bursts until the TXFIFO is empty. When wait states can be inserted between SPI bursts, the SS will negate between SPI bursts until the wait states finish.

21.4.4.1.4 Master Mode with Phase Control

The Phase Control (ECSPI_CONREG[PHA]) bit controls how the transmit data shifts out and the receive data shifts in.

When the Phase control (ECSPI_CONREG[PHA]) bit is set, the transmit data will shift out on the rising edge of SCLK, and the receive data is latched on the falling edge of SCLK. The most-significant bit is output on the first rising SCLK edge.

When ECSPI_CONREG[PHA] is cleared, the transmit data is shifted out on the falling edge of SCLK and the receive data is latched on the rising edge of SCLK. The MSB is output when the host processor loads the transmitted data.

Inverting the SCLK polarity does not impact the edge-triggered operations because they are internal to the serial peripheral interface master. [Figure 21-10](#) shows how SPI burst works with different POL and PHA configuration.

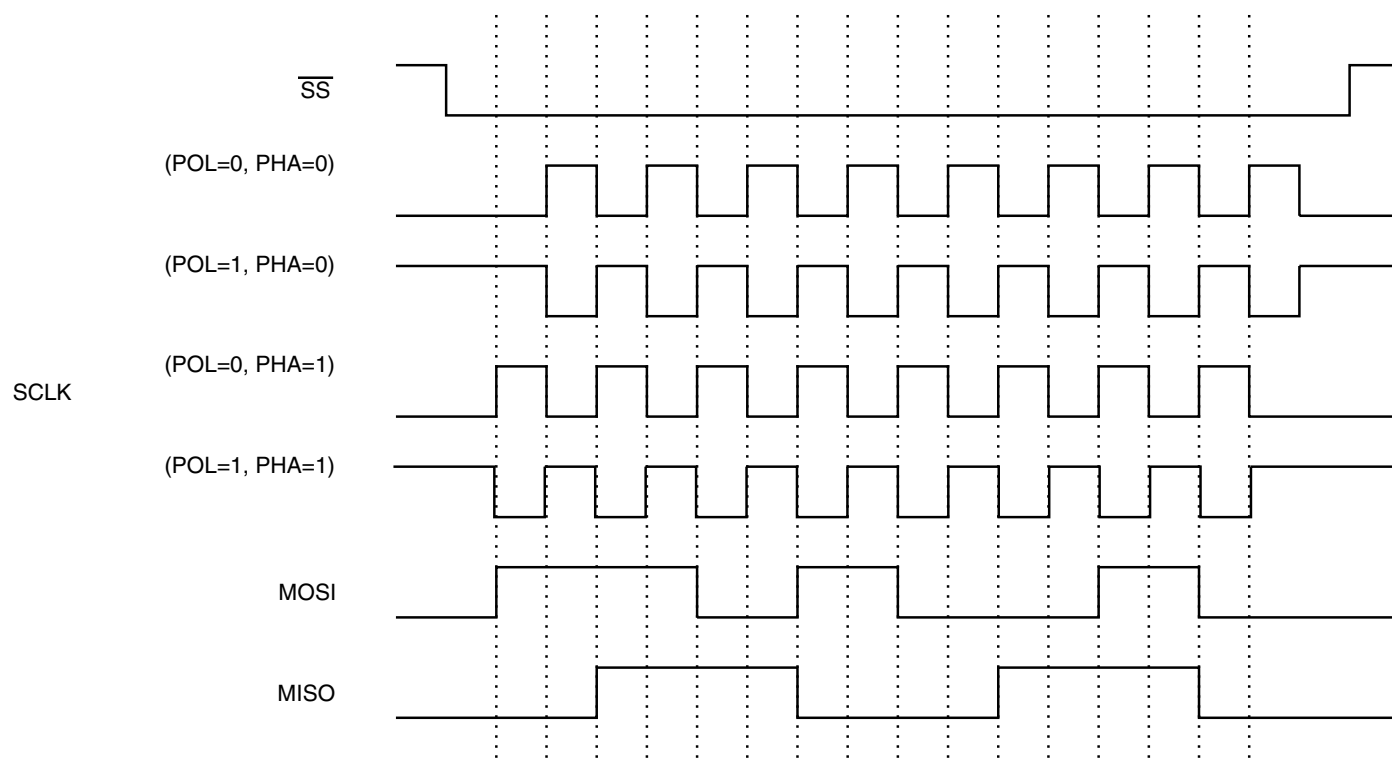

Figure 21-10. SPI Burst with Different POL and PHA Configurations

21.4.4.2 Typical Slave Mode

When the ECSPI is configured as a slave (Mode = 0), software can configure the ECSPI Control register to match the external SPI master's timing. In this configuration, \overline{SS} becomes an input signal, and is used to latch data in and out of the internal data Shift registers, as well as to advance the data FIFO.

The SS, SCLK, and MOSI are inputs and MISO is output. Most of the timing diagrams are similar to the diagrams shown previously for the SPI in Master mode (Mode = 1), because the inputs come from a SPI master device.

However, the timing is different when SS is used to advance the data FIFO. When the SS_CTL[3:0] is set while the ECSPI is configured in Slave mode, the data FIFO will advance on the rising edge of the SS signal. When the polarity is reversed (SSPOL = 1), the data FIFO will advance on the falling edge of the SS signal.

The figure below shows a SPI burst in which the data FIFO is advanced by the rising edge of the SS signal.

Figure 21-11. Advancing the Data FIFO on the Rising Edge of \overline{SS}

In the above case, only the most significant 7 bits are loaded to the RXFIFO.

21.4.5 Reset

Whenever a device reset occurs, a reset is performed on the ECSPI, resetting all registers to their default values.

Software can reset the block using the CONREG[EN] bit; see [ECSPI](#).

21.4.6 Interrupts

Interrupt control provides a way to manage the ECSPI FIFOs:

- For transmitting data, software can enable the TXFIFO empty, TXFIFO data request, and TXFIFO full interrupts to maintain the TXFIFO using an interrupt service routine.
- For receiving data, software can enable the RXFIFO ready, RXFIFO data request, and RXFIFO full interrupts to retrieve data from the RXFIFO using an interrupt service routine.

Other interrupt sources can be used to control or debug the SPI bursts:

- The transfer-completed interrupt means that there is no data left in the TXFIFO and that the data in the Shift register has been shifted out.
- The RXFIFO overflow interrupt means that the RXFIFO received more than 64 words and will not accept any other words.

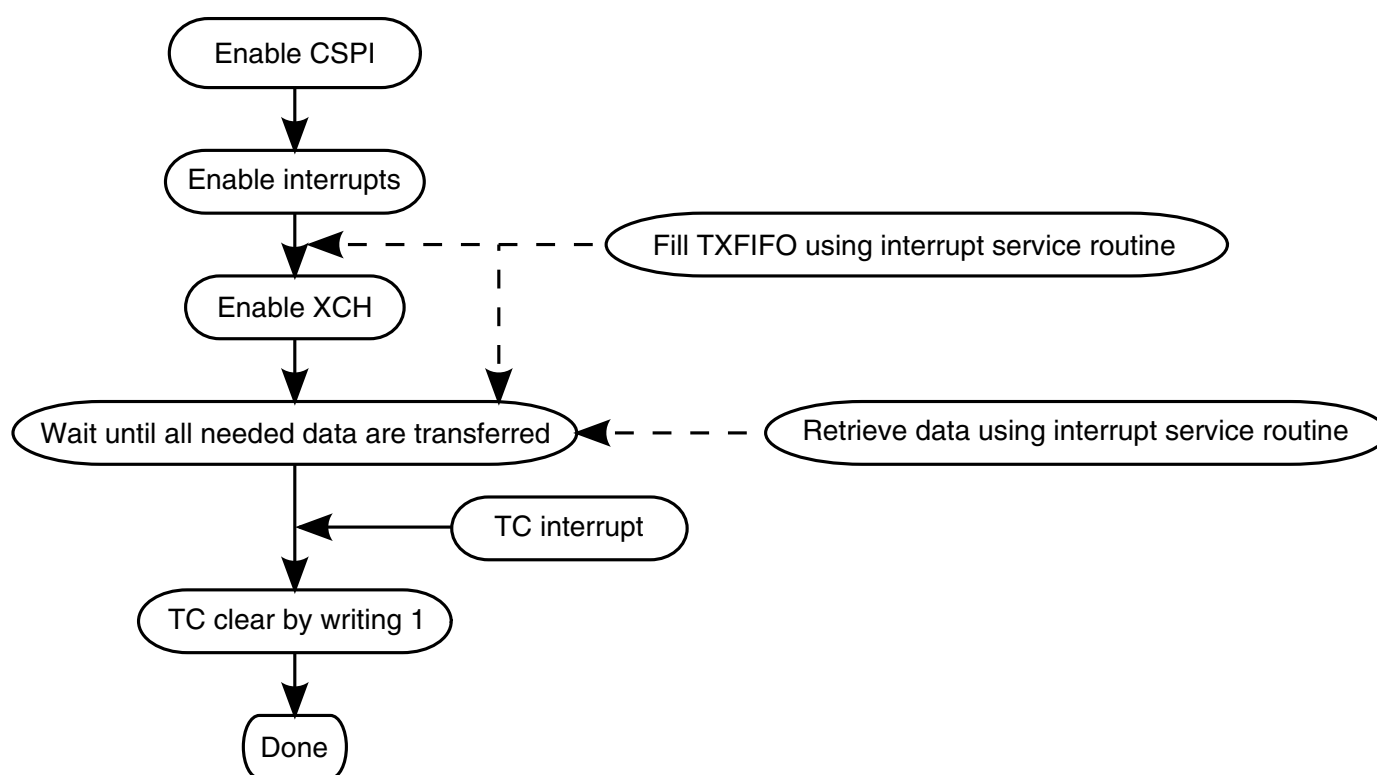

Figure 21-12. Program Sequence of SPI Burst Using Interrupt Control

21.4.7 DMA

DMA control provides another method to utilize the FIFOs in the ECSPI. By using DMA request and acknowledge signals, larger amounts of data can be transferred, and will reduce interrupts and host processor loading. When the appropriate conditions are matched, the block will send out a DMA request.

The DMA can deal with the following conditions:

- TXFIFO empty
- TXFIFO data request
- RXFIFO data request
- RXFIFO full

The figure below shows a program sequence of SPI bursts using DMA control.

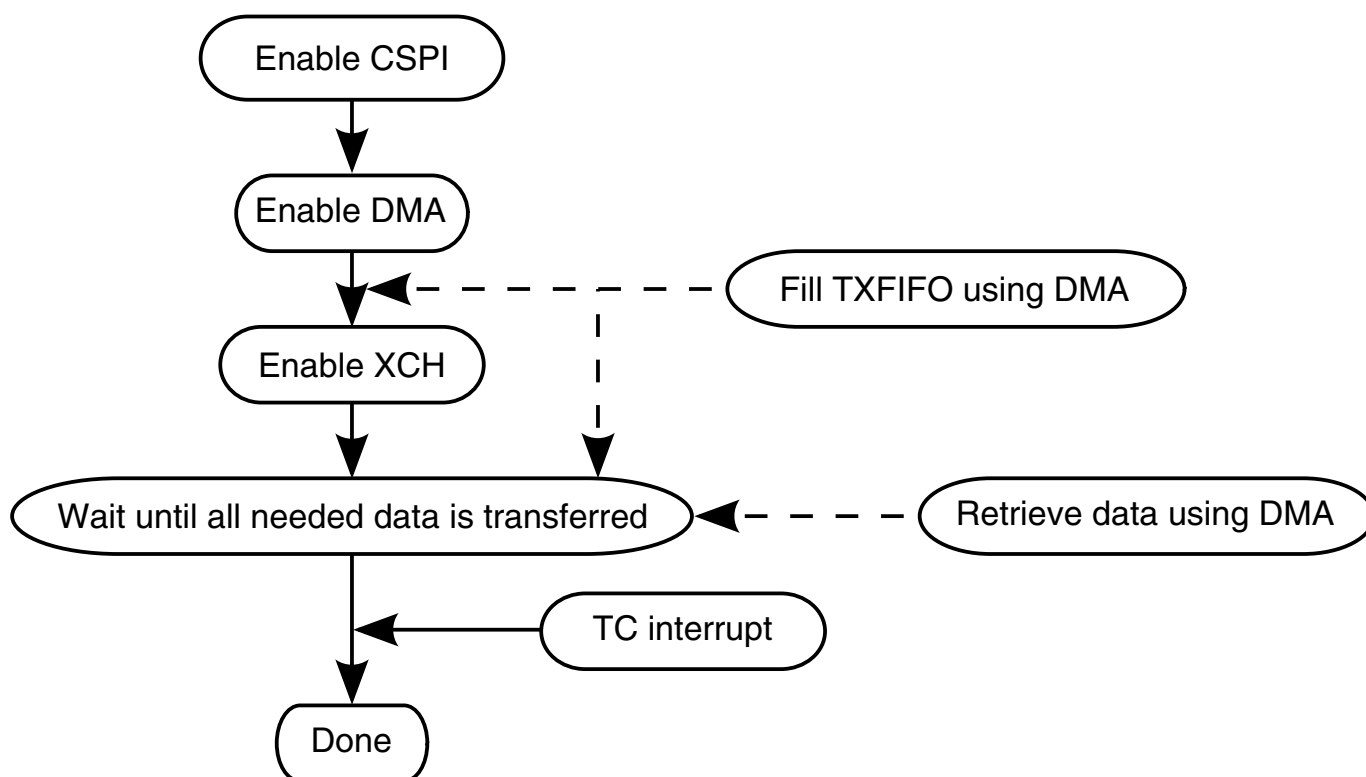

Figure 21-13. Program Sequence of SPI Burst Using DMA

21.4.8 Byte Order

The ECSPI does not support byte re-ordering in hardware.

21.5 Initialization

This section provides initialization information for ECSPI.

To initialize the block:

1. Clear the EN bit in ECSPI_CONREG to reset the block.
2. Enable the clocks for ECSPI.
3. Set the EN bit in ECSPI_CONREG to put ECSPI out of reset.
4. Configure corresponding IOMUX for ECSPI external signals.
5. Configure registers of ECSPI properly according to the specifications of the external SPI device.

21.6 Applications

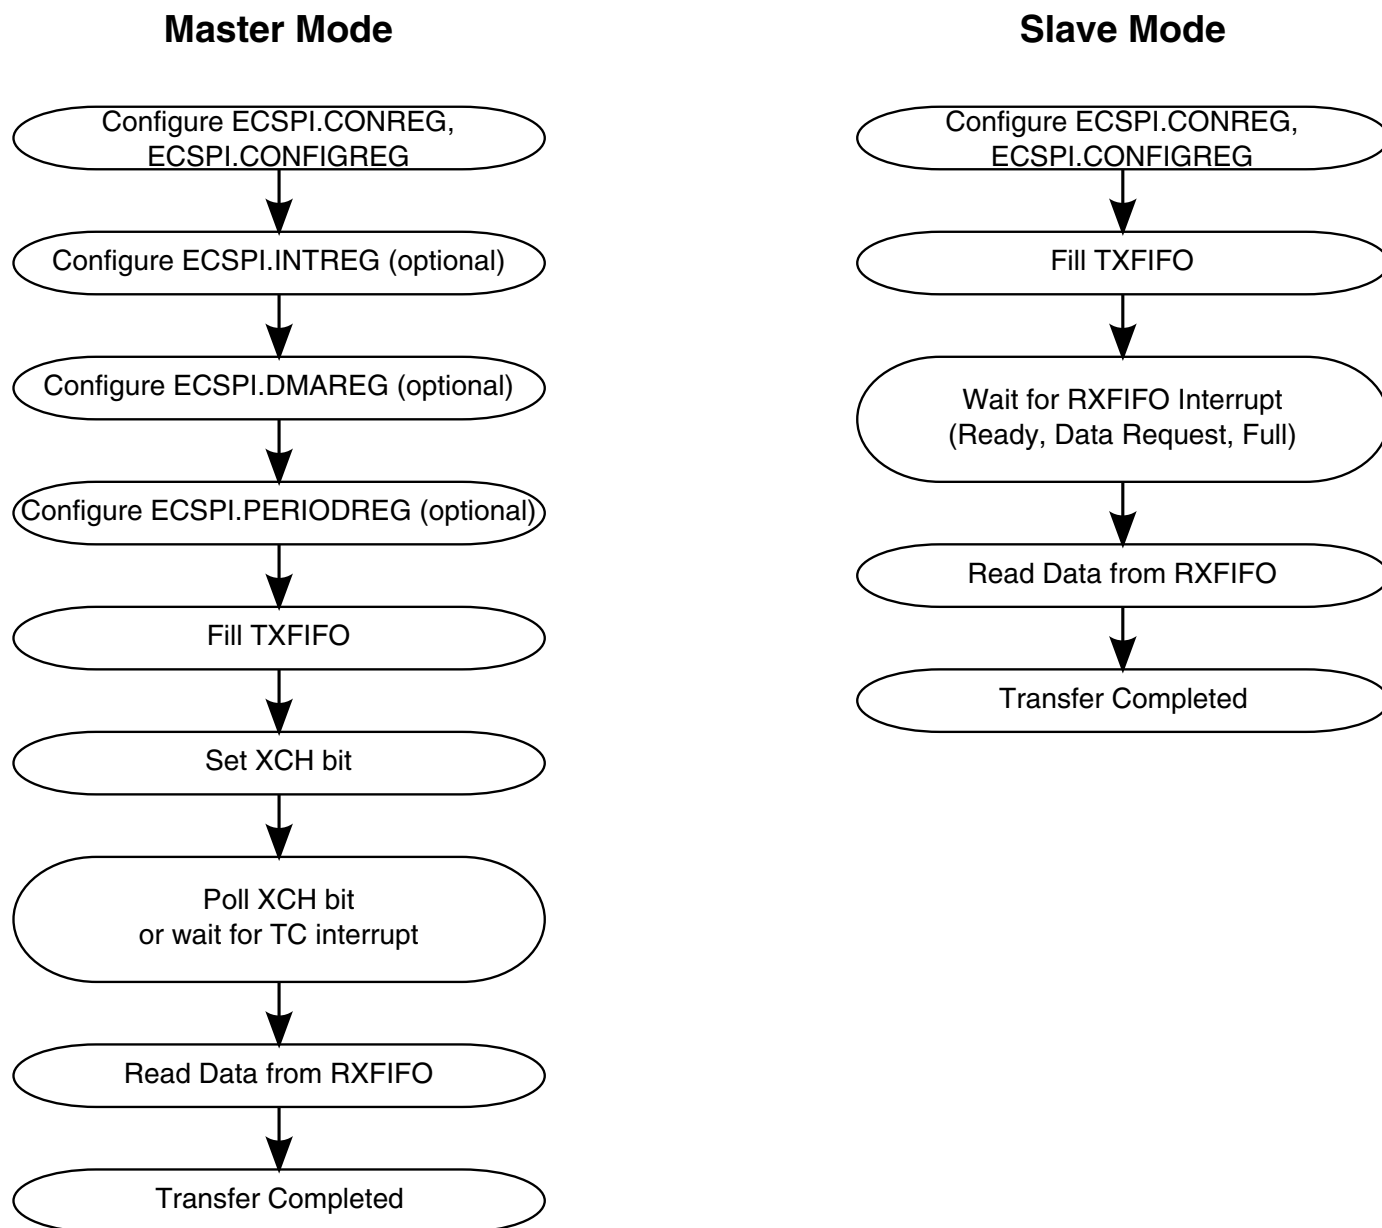

Figure 21-14. Flowchart of the ECSPI Operation

21.7 ECSPI Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a particular block instantiation, see the system memory map.

ECSPI memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/page |

21.7.2 Receive Data Register (ECSPiX_RXDATA)

The Receive Data register (ECSPI_RXDATA) is a read-only register that forms the top word of the 64 x 32 receive FIFO. This register holds the data received from an external SPI device during a data transaction. Only word-sized read operations are allowed.

Address: Base address + 0h offset

ECSPiX_RXDATA field descriptions

| Field | Description |
|----------------------|---|
| 31–0 ECSPI_RXDATA | Receive Data. This register holds the top word of the receive data FIFO. The FIFO is advanced for each read of this register. The data read is undefined when the Receive Data Ready (RR) bit in the Interrupt Control/Status register is cleared. Zeros are read when ECSPI is disabled. |

21.7.3 Transmit Data Register (ECSPIx_TXDATA)

The Transmit Data (ECSPI_TXDATA) register is a write-only data register that forms the bottom word of the 64 x 32 TXFIFO. The TXFIFO can be written to as long as it is not full, even when the SPI Exchange bit (XCH) in ECSPI_CONREG is set. This allows software to write to the TXFIFO during a SPI data exchange process. Writes to this register are ignored when the ECSPI is disabled (ECSPI_CONREG[EN] bit is cleared).

Address: Base address + 4h offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | ECSPI_TXDATA | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

ECSPIx_TXDATA field descriptions

| Field | Description |
|----------------------|---|
| 31–0 ECSPI_TXDATA | Transmit Data. This register holds the top word of data loaded into the FIFO. Data written to this register must be a word operation. The number of bits actually transmitted is determined by the BIT_COUNT field of the corresponding SPI Control register. If this field contains more bits than the number specified by BIT_COUNT, the extra bits are ignored. For example, to transfer 10 bits of data, a 32-bit word must be written to this register. Bits 9-0 are shifted out and bits 31-10 are ignored. When the ECSPI is operating in Slave mode, zeros are shifted out when the FIFO is empty. Zeros are read when ECSPI is disabled. |

21.7.4 Control Register (ECSPIx_CONREG)

The Control Register (ECSPI_CONREG) allows software to enable the ECSPI, configure its operating modes, specify the divider value, and SPI_RDY control signal, and define the transfer length.

Address: Base address + 8h offset

| | | | | | | | | | | | | | | | | |
|-------|--------------|----|----|----|----|----|----|----|----|----|----|----|----------------|----|-------|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

ECSPiX_CONREG field descriptions

| Field | Description |
|-------------------------|--|
| 31–20 BURST_LENGTH | <p>Burst Length. This field defines the length of a SPI burst to be transferred. The Chip Select (SS) will remain asserted until all bits in a SPI burst are shifted out. A maximum of 2^{12} bits can be transferred in a single SPI burst.</p> <p>In master mode, it controls the number of bits per SPI burst. Since the shift register always loads 32-bit data from transmit FIFO, only the n least-significant ($n = \text{BURST_LENGTH} + 1$) will be shifted out. The remaining bits will be ignored.</p> <p>In slave mode, only when SS_CTL is cleared, this field will take effect in the transfer.</p> <p>Number of Valid Bits in a SPI burst.</p> <p>0x000 A SPI burst contains the 1 LSB in a word. 0x001 A SPI burst contains the 2 LSB in a word. 0x002 A SPI burst contains the 3 LSB in a word. ... 0x01F A SPI burst contains all 32 bits in a word. 0x020 A SPI burst contains the 1 LSB in first word and all 32 bits in second word. 0x021 A SPI burst contains the 2 LSB in first word and all 32 bits in second word. ... 0xFFE A SPI burst contains the 31 LSB in first word and $2^7 - 1$ words. 0xFFF A SPI burst contains 2^7 words.</p> |
| 19–18 CHANNEL_SELECT | <p>SPI CHANNEL SELECT bits. Select one of four external SPI Master/Slave Devices. In master mode, these two bits select the external slave devices by asserting the Chip Select (SS_n) outputs. Only the selected Chip Select (SS_n) signal can be active at a given time; the remaining three signals will be negated.</p> <p>00 Channel 0 is selected. Chip Select 0 (SS0) will be asserted. 01 Channel 1 is selected. Chip Select 1 (SS1) will be asserted. 10 Channel 2 is selected. Chip Select 2 (SS2) will be asserted. 11 Channel 3 is selected. Chip Select 3 (SS3) will be asserted.</p> |
| 17–16 DRCTL | <p>SPI Data Ready Control. This field selects the utilization of the $\overline{\text{SPI_RDY}}$ signal in master mode. ECSPI checks this field before it starts an SPI burst.</p> <p>00 The $\overline{\text{SPI_RDY}}$ signal is a don't care. 01 Burst will be triggered by the falling edge of the SPI_RDY signal (edge-triggered). 10 Burst will be triggered by a low level of the SPI_RDY signal (level-triggered). 11 Reserved.</p> |
| 15–12 PRE_DIVIDER | <p>SPI Pre Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the pre-divider of the reference clock.</p> <p>0000 Divide by 1. 0001 Divide by 2. 0010 Divide by 3. ... 1101 Divide by 14. 1110 Divide by 15. 1111 Divide by 16.</p> |
| 11–8 POST_DIVIDER | <p>SPI Post Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the post-divider of the reference clock using the equation: 2^n.</p> <p>0000 Divide by 1.</p> |

Table continues on the next page...

ECSPiX_CONREG field descriptions (continued)

| Field | Description |
|-------------------------|---|
| | 0001 Divide by 2. 0010 Divide by 4. ... 1110 Divide by 2^{14} . 1111 Divide by 2^{15} . |
| 7–4 CHANNEL_ MODE | SPI CHANNEL MODE selects the mode for each SPI channel. CHANNEL MODE[3] is for SPI channel 3. CHANNEL MODE[2] is for SPI channel 2. CHANNEL MODE[1] is for SPI channel 1. CHANNEL MODE[0] is for SPI channel 0. 0 Slave mode. 1 Master mode. |
| 3 SMC | Start Mode Control. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). It controls how the ECSPI starts a SPI burst, either through the SPI exchange bit, or immediately when the TXFIFO is written to. 0 SPI Exchange Bit (XCH) controls when a SPI burst can start. Setting the XCH bit will start a SPI burst or multiple bursts. This is controlled by the SPI SS Wave Form Select (SS_CTL). Refer to XCH and SS_CTL descriptions. 1 Immediately starts a SPI burst when data is written in TXFIFO. |
| 2 XCH | SPI Exchange Bit. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). If the Start Mode Control (SMC) bit is cleared, writing a 1 to this bit starts one SPI burst or multiple SPI bursts according to the SPI SS Wave Form Select (SS_CTL). The XCH bit remains set while either the data exchange is in progress, or when the ECSPI is waiting for an active input if SPIRDY is enabled through DRCTL. This bit is cleared automatically when all data in the TXFIFO and the shift register has been shifted out. 0 Idle. 1 Initiates exchange (write) or busy (read). |
| 1 HT | Hardware Trigger Enable. This bit is used in master mode only. It enables hardware trigger (HT) mode. Note, HT mode is not supported by this product. 0 Disable HT mode. 1 Enable HT mode. |
| 0 EN | SPI Block Enable Control. This bit enables the ECSPI. This bit must be set before writing to other registers or initiating an exchange. Writing zero to this bit disables the block and resets the internal logic with the exception of the ECSPiX_CONREG. The block's internal clocks are gated off whenever the block is disabled. 0 Disable the block. 1 Enable the block. |

21.7.5 Config Register (ECSPIx_CONFIGREG)

The Config Register (ECSPI_CONFIGREG) allows software to configure each SPI channel, configure its operating modes, specify the phase and polarity of the clock, configure the Chip Select (SS), and define the HT transfer length. Note, HT mode is not supported by this product.

Address: Base address + Ch offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | |

| W | Reserved | | | | | | | | HT_LENGTH | | | | SCLK_CTL | | | | DATA_CTL | | | | SS_POL | | | | SS_CTL | | | | SCLK_POL | | | | SCLK_PHA | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | | | |

ECSPIx_CONFIGREG field descriptions

| Field | Description |
|--------------------|--|
| 31–29 - | This field is reserved. Reserved |
| 28–24 HT_LENGTH | HT LENGTH. This field defines the message length in HT Mode. Note, HT mode is not supported by this product. The length in bits of one message is (HT LENGTH + 1). |
| 23–20 SCLK_CTL | SCLK CTL. This field controls the inactive state of SCLK for each SPI channel. SCLK CTL[3] is for SPI channel 3. SCLK CTL[2] is for SPI channel 2. SCLK CTL[1] is for SPI channel 1. SCLK CTL[0] is for SPI channel 0. 0 Stay low. 1 Stay high. |
| 19–16 DATA_CTL | DATA CTL. This field controls inactive state of the data line for each SPI channel. DATA CTL[3] is for SPI channel 3. DATA CTL[2] is for SPI channel 2. DATA CTL[1] is for SPI channel 1. DATA CTL[0] is for SPI channel 0. 0 Stay high. 1 Stay low. |
| 15–12 SS_POL | SPI SS Polarity Select. In both Master and Slave modes, this field selects the polarity of the Chip Select (SS) signal. SS POL[3] is for SPI channel 3. SS POL[2] is for SPI channel 2. SS POL[1] is for SPI channel 1. SS POL[0] is for SPI channel 0. |

Table continues on the next page...

ECSPiX_CONFIGREG field descriptions (continued)

| Field | Description |
|-----------------|--|
| | <p>0 Active low. 1 Active high.</p> |
| 11–8 SS_CTL | <p>SPI SS Wave Form Select. In master mode, this field controls the output wave form of the Chip Select (SS) signal when the SMC (Start Mode Control) bit is cleared. The SS_CTL are ignored if the SMC bit is set.</p> <p>SS_CTL[3] is for SPI channel 3. SS_CTL[2] is for SPI channel 2. SS_CTL[1] is for SPI channel 1. SS_CTL[0] is for SPI channel 0.</p> <p>In slave mode, this bit controls when the SPI burst is completed.</p> <p>An SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data.</p> <p>0 In master mode - only one SPI burst will be transmitted. 1 In master mode - Negate Chip Select (SS) signal between SPI bursts. Multiple SPI bursts will be transmitted. The SPI transfer will automatically stop when the TXFIFO is empty.</p> <p>0 In slave mode - an SPI burst is completed when the number of bits received in the shift register is equal to (BURST LENGTH + 1). Only the n least-significant bits (n = BURST LENGTH[4:0] + 1) of the first received word are valid. All bits subsequent to the first received word in RXFIFO are valid. 1 In slave mode - an SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data.</p> |
| 7–4 SCLK_POL | <p>SPI Clock Polarity Control. This field controls the polarity of the SCLK signal. See Figure 21-10 for more information.</p> <p>SCLK_POL[3] is for SPI channel 3. SCLK_POL[2] is for SPI channel 2. SCLK_POL[1] is for SPI channel 1. SCLK_POL[0] is for SPI channel 0.</p> <p>0 Active high polarity (0 = Idle). 1 Active low polarity (1 = Idle).</p> |
| 3–0 SCLK_PHA | <p>SPI Clock/Data Phase Control. This field controls the clock/data phase relationship. See Figure 21-10 for more information.</p> <p>SCLK_PHA[3] is for SPI channel 3. SCLK_PHA[2] is for SPI channel 2. SCLK_PHA[1] is for SPI channel 1. SCLK_PHA[0] is for SPI channel 0.</p> <p>0 Phase 0 operation. 1 Phase 1 operation.</p> |

21.7.6 Interrupt Control Register (ECSPIx_INTREG)

The Interrupt Control Register (ECSPI_INTREG) enables the generation of interrupts to the host processor. If the ECSPI is disabled, this register reads zero.

Address: Base address + 10h offset

| 0 TEEN | TXFIFO Empty Interrupt enable. This bit enables the TXFIFO Empty Interrupt. 0 Disable 1 Enable |

21.7.7 DMA Control Register (ECSPIx_DMAREG)

The Direct Memory Access Control Register (ECSPI_DMAREG) provides software a way to use an on-chip DMA controller for ECSPI data. Internal DMA request signals enable direct data transfers between the ECSPI FIFOs and system memory. The ECSPI sends out DMA requests when the appropriate FIFO conditions are matched.

If the ECSPI is disabled, this register is read as 0.

Address: Base address + 14h offset

| | | | | | | | | | | | | | | | | |

| Field | Description |
|----------|--|
| | 0 TXFIFO is not Full. 1 TXFIFO is Full. |
| 1 TDR | TXFIFO Data Request. 0 Number of empty slots in TXFIFO is greater than TX_THRESHOLD. 1 Number of empty slots in TXFIFO is not greater than TX_THRESHOLD. |
| 0 TE | TXFIFO Empty. This bit is set if the TXFIFO is empty. 0 TXFIFO contains one or more words. 1 TXFIFO is empty. |

21.7.9 Sample Period Control Register (ECSPiX_PERIODREG)

The Sample Period Control Register (ECSPiX_PERIODREG) provides software a way to insert delays (wait states) between consecutive SPI transfers. Control bits in this register select the clock source for the sample period counter and the delay count indicating the number of wait states to be inserted between data transfers.

The delay counts apply only when the current channel is operating in Master mode (ECSPiX_CONREG[CHANNEL MODE] = 1). ECSPiX_PERIODREG also contains the CSD CTRL field used to insert a delay between the Chip Select's active edge and the first SPI Clock edge.

Address: Base address + 1Ch offset

| 15 CSRC | Clock Source Control. This bit selects the clock source for the sample period counter. 0 SPI Clock (SCLK) 1 Low-Frequency Reference Clock (32.768 KHz) |
| 14–0 SAMPLE_ PERIOD | Sample Period Control. These bits control the number of wait states to be inserted in data transfers. During the idle clocks, the state of the SS output will operate according to the SS_CTL control field in the ECSPiX_CONREG register. 0x0000 0 wait states inserted 0x0001 1 wait state inserted 0x7FFE 32766 wait states inserted 0x7FFF 32767 wait states inserted |

21.7.10 Test Control Register (ECSPiX_TESTREG)

The Test Control Register (ECSPI_TESTREG) provides software a mechanism to internally connect the receive and transmit devices of the ECSPI, and monitor the contents of the receive and transmit FIFOs.

Address: Base address + 20h offset

ECSPiX_TESTREG field descriptions

| Field | Description |
|---------------|---|
| 31 LBC | Loop Back Control. This bit is used in Master mode only. When this bit is set, the ECSPI connects the transmitter and receiver sections internally, and the data shifted out from the most-significant bit of the shift register is looped back into the least-significant bit of the Shift register. In this way, a self-test of the complete transmit/receive path can be made. The output pins are not affected, and the input pins are ignored. 0 Not connected. 1 Transmitter and receiver sections internally connected for Loopback. |
| 30–28 - | This field is reserved. Reserved, all bits should be ignored. |
| 27–15 - | This field is reserved. Reserved |
| 14–8 RXCNT | RXFIFO Counter. This field indicates the number of words in the RXFIFO. |

Table continues on the next page...

ECSPiX_TESTREG field descriptions (continued)

ECSPiX_MSGDATA field descriptions

| Field | Description |
|------------------------|---|
| 31–0 ECSPiX_MSGDATA | ECSPiX_MSGDATA holds the top word of MSG Data FIFO. The MSG Data FIFO is advanced for each write of this register. The data read is zero. The data written to this register is stored in the MSG Data FIFO. |

Chapter 22

External Interface Module (EIM)

22.1 Overview

The EIM handles the interface to devices external to the chip, including generation of chip selects, clock and control for external peripherals and memory. It provides asynchronous access to devices with SRAM-like interface and synchronous access to devices with NOR-Flash-like or PSRAM-like interface.

Overview

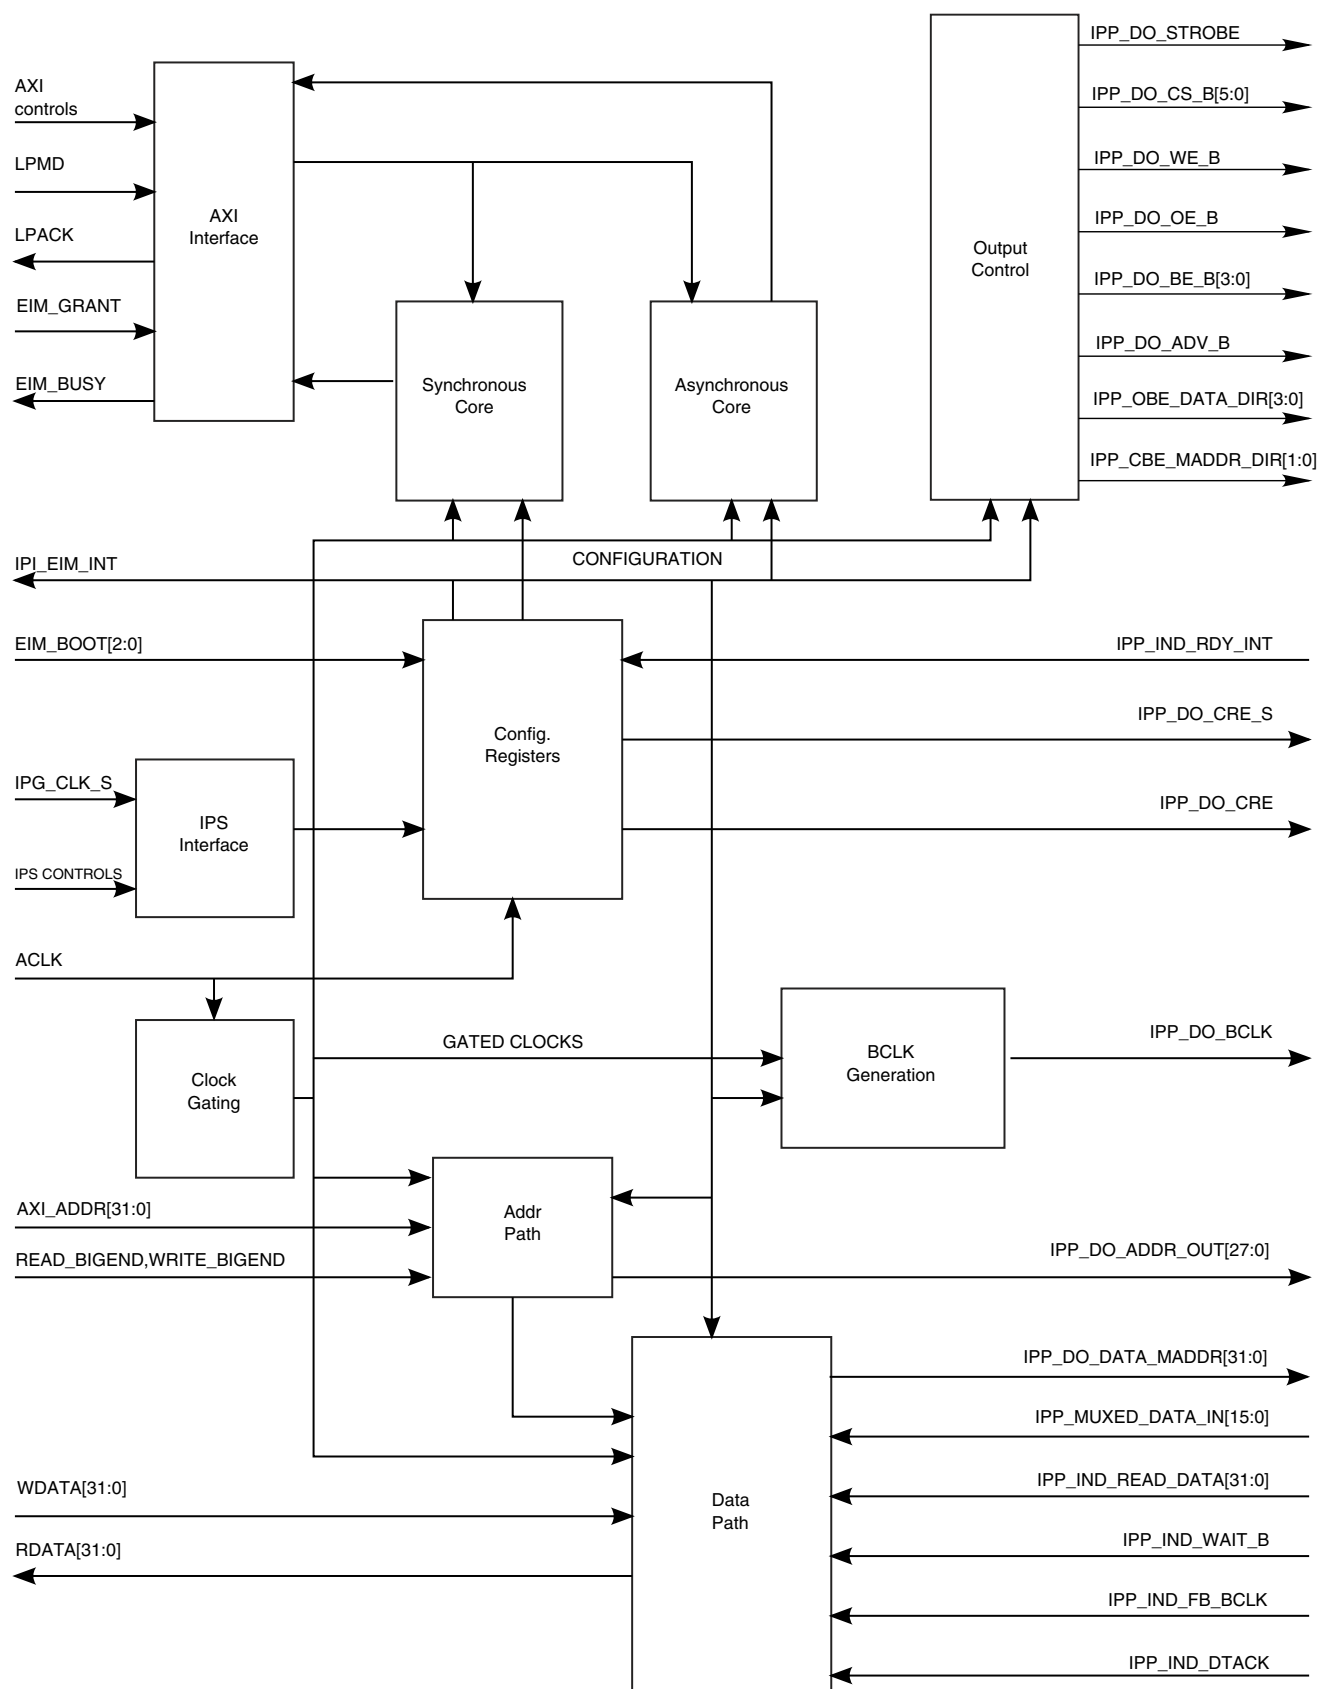

Figure 22-1. EIM Diagram

22.1.1 Features

- Up to four chip selects for external devices
 - Flexible address decoding. Each chip select memory space determined separately, according to VIA port configuration (see [Chip Select Memory Map](#)). Configurable Chip Select 0 base address (by VIA)
 - Individual select signal for each one of the memory space defined. Up to 6 memory spaces may be defined and programmed individually.
 - 26-bit external address bus, max memory size can be 128 MByte (1 Gigabit).
- Selectable Write Protection for each Chip Select
- Support for multiplexed address / data bus operation x16 and x32 port size
- Programmable Data Port Size for each Chip Select (x8, x16 and x32)
- Programmable Wait-State generator for each Chip Select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Support for Asynchronous page mode accesses (x16 and x32 port size)
- Independent synchronous Memory Burst Read Mode support for NOR-Flash and PSRAM memories (x16 and x32 port size)
- Independent synchronous Memory Burst Write Mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Support of NAND-Flash devices with NOR-Flash like interface - MDOC™ (M-Systems), OneNAND™ (Samsung)
- Independent programmable variable/fix Latency support for read and write synchronous (burst) mode
- Support for Big Endian and Little Endian operation modes per access
- ARM AXI slave interface. One ID at a time support.
- External Interrupt support, RDY_INT signal function as external interrupt
- Boot from external device support according to boot signals, using RDY_INT signal
 - RDY signal support assertion after reset for MDOC™ (M-Systems) device
 - INT signal support assertion after reset for OneNAND™ (Samsung) device

22.1.2 Modes of Operation

The EIM has the following modes of operation:

- Asynchronous Mode
- Asynchronous Page Mode
- Multiplexed Address/Data mode
- Burst Clock Mode

- Low Power Modes
- Boot Mode

See details in the [EIM Operational Modes](#).

22.1.2.1 Asynchronous Mode

This is a non-burst mode that is used for SRAM access. In this mode, a single data is read/written with each access (asserted address).

All controls' timings are controlled by preset values in Chip Select Configuration Registers.

22.1.2.2 Asynchronous Page Read Mode

Setting the APR bit causes the EIM to perform memory burst accesses by emulating page mode operation.

The external address asserts for each piece of data. The initial access timing is according to RWSC field, and the next address assertions timing is according to PAT field. When APR bit is set, RCSN OEN, RADVN and RBEN fields are ignored for burst access to the external device.

The page size can be set via the BL field to 2, 4, 8, 16, or 32 words (the word size is determined by the DSZ field).

22.1.2.3 Multiplexed Address/Data Mode

In this mode, multiplexing addresses and data bits on the same pins is supported for synchronous/asynchronous accesses to x8/x16/ x32 data width memory devices.

For more information about the pins that drive data/address in 8/16/32 non-muxed mode and 16/32 muxed mode, refer to the EIM Internal Module Multiplexing table in the EIM Internal Pads Allocation chapter of the datasheet.

Table 22-1. EIM multiplexing

| Setup | Non Multiplexed Address/Data Mode | | | | | | | Multiplexed Address/ Data mode | |

22.1.2.4 Burst Clock Mode

The controller has the ability to support burst synchronous operations in various frequencies, depending on the frequency of the input clock supplied by the system (EIM clock).

The EIM clock can be divided by one, two, three or four, and its frequency can be changed according to the requirements. Variable and fix latency are supported for this mode, according to the external device requirements.

- Synchronous read mode. This is a burst mode, which is used for reading from Flash/PSRAM memory devices. In this mode, after address assertion a burst of sequential data can be read. Data exchange is carried out according to BCLK being generated by EIM. An access is delayed according to external WAIT_B signal assertion (signal from the memory device).
- Synchronous write mode. A burst mode used for accessing external devices, which support synchronous write type of access (PSRAM protocol). In this mode, after address assertion a burst of sequential data can be written to the external device. Access may be delayed according to WAIT_B signal assertion (signal from the memory device) before first piece of data arrived to the external device.

NOTE

Maximum frequency of the EIM main clock is 133Mhz. It may be reduced by the system for special cases of external devices,

which demand a different frequency than integer division of the 133MHz clock.

22.1.2.5 Low Power Modes

The input clock is gated by ACT_CS bits. When all the ACT_CS are negated (all CS disable) the internal clock is turned off; awready/wready & arready signal are de-asserted and the master can't access the EIM.

22.1.2.6 Boot Mode

It is possible to perform a boot operation from external device located on CS0. The configuration of the relevant bits are done with boot mode signals according to the external device parameters (for example, port size and protocol assertion).

See [System Boot](#) for more details.

22.2 External Signals

The following table describes the external signals of EIM:

Table 22-2. EIM External Signals

| Signal | Description | Pad | Mode | Direction |
|----------|---|---------|------|-----------|
| EIM_AD00 | LSB multiplexed Address/Data Bus signal | EIM_DA0 | ALT0 | IO |
| EIM_AD01 | LSB multiplexed Address/Data Bus signal | EIM_DA1 | ALT0 | IO |
| EIM_AD02 | LSB multiplexed Address/Data Bus signal | EIM_DA2 | ALT0 | IO |
| EIM_AD03 | LSB multiplexed Address/Data Bus signal | EIM_DA3 | ALT0 | IO |
| EIM_AD04 | LSB multiplexed Address/Data Bus signal | EIM_DA4 | ALT0 | IO |
| EIM_AD05 | LSB multiplexed Address/Data Bus signal | EIM_DA5 | ALT0 | IO |
| EIM_AD06 | LSB multiplexed Address/Data Bus signal | EIM_DA6 | ALT0 | IO |
| EIM_AD07 | LSB multiplexed Address/Data Bus signal | EIM_DA7 | ALT0 | IO |
| EIM_AD08 | LSB multiplexed Address/Data Bus signal | EIM_DA8 | ALT0 | IO |

Table continues on the next page...

Table 22-2. EIM External Signals (continued)

| Signal | Description | Pad | Mode | Direction |
|------------|--|-----------|------|-----------|
| EIM_AD09 | LSB multiplexed Address/Data Bus signal | EIM_DA9 | ALT0 | IO |
| EIM_AD10 | LSB multiplexed Address/Data Bus signal | EIM_DA10 | ALT0 | IO |
| EIM_AD11 | LSB multiplexed Address/Data Bus signal | EIM_DA11 | ALT0 | IO |
| EIM_AD12 | LSB multiplexed Address/Data Bus signal | EIM_DA12 | ALT0 | IO |
| EIM_AD13 | LSB multiplexed Address/Data Bus signal | EIM_DA13 | ALT0 | IO |
| EIM_AD14 | LSB multiplexed Address/Data Bus signal | EIM_DA14 | ALT0 | IO |
| EIM_AD15 | LSB multiplexed Address/Data Bus signal | EIM_DA15 | ALT0 | IO |
| EIM_ADDR16 | MSB Address Bus signal | EIM_A16 | ALT0 | O |
| EIM_ADDR17 | MSB Address Bus signal | EIM_A17 | ALT0 | O |
| EIM_ADDR18 | MSB Address Bus signal | EIM_A18 | ALT0 | O |
| EIM_ADDR19 | MSB Address Bus signal | EIM_A19 | ALT0 | O |
| EIM_ADDR20 | MSB Address Bus signal | EIM_A20 | ALT0 | O |
| EIM_ADDR21 | MSB Address Bus signal | EIM_A21 | ALT0 | O |
| EIM_ADDR22 | MSB Address Bus signal | EIM_A22 | ALT0 | O |
| EIM_ADDR23 | MSB Address Bus signal | EIM_A23 | ALT0 | O |
| EIM_ADDR24 | MSB Address Bus signal | EIM_A24 | ALT0 | O |
| EIM_ADDR25 | MSB Address Bus signal | EIM_A25 | ALT0 | O |
| EIM_ADDR26 | MSB Address Bus signal | NANDF_CS3 | ALT3 | O |
| EIM_BCLK | Burst Clock (BCLK). This active-high output signal is used to clock external burstcapable devices to synchronize the loading and incrementing of addresses and delivery of burst read and write data to/from the EIM. Its behavior is affected by the BCM field in the EIM_WCR and the SWR, SRD, BCD, and BCS fields of the EIM_CSxGCR1. | EIM_BCLK | ALT0 | O |
| EIM_CRE | Used as CRE/PS for CellularRam memory. It is used for the Mode Register Set command. This signal can be configured as active low or active high. See CRE and CREP field descriptions of the EIM_CSxGCR1 registers. | NANDF_CS2 | ALT3 | O |

| EIM_DTACK_B | Data Acknowledge, asynchronous access. This input is used as a data acknowledge signal for single asynchronous accesses. | EIM_WAIT | ALT1 | I |
| EIM_EB0 | <p>Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only.</p> <p>EIM_EB[0] corresponds to DATA_OUT[7:0]</p> <p>For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.</p> | EIM_EB0 | ALT0 | O |
| EIM_EB1 | <p>Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only.</p> <p>EIM_EB[1] corresponds to DATA_OUT[15:8]</p> <p>For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.</p> | EIM_EB1 | ALT0 | O |

Table continues on the next page...

Table 22-2. EIM External Signals (continued)

| Signal | Description | Pad | Mode | Direction |
|---------|---|---------|------|-----------|
| EIM_EB2 | <p>Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only.</p> <p>EIM_EB[2] corresponds to DATA_OUT[23:16]</p> <p>For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.</p> | EIM_EB2 | ALT0 | O |
| EIM_EB3 | <p>Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only.</p> <p>EIM_EB[3] corresponds to DATA_OUT[31:24].</p> <p>For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.</p> | EIM_EB3 | ALT0 | O |
| EIM_LBA | <p>Address Valid. This active-low output signal is asserted during burst mode accesses to cause the external burst capable device to load a new starting burst address. Assertion of LBA indicates that a valid address is present on the address bus. Its behavior is affected by the SWR, SRD, BCD, and BCS fields of the EIM_CSxGCR1 registers, the RADVA and RADVN fields of the EIM_CSxRCR1 registers, and the WADVA and WADVN fields of the EIM_CSxWCR1 registers. In asynchronous mode, LBA length is affected by the RADVA, WADVA, RADVN, and WADVN fields. Minimum length of LBA signal in all modes is one EIM clock cycle.</p> | EIM_LBA | ALT0 | O |

Table continues on the next page...

Table 22-2. EIM External Signals (continued)

| Signal | Description | Pad | Mode | Direction |
|----------|---|----------|------|-----------|
| EIM_OE | Output Enable. This active-low output signal indicates the bus access is a read and enables external devices to drive the data bus with read data. Its behavior is affected by the OEA and OEN bit fields in the Chip Select Configuration Registers. | EIM_OE | ALT0 | O |
| EIM_RW | Memory Write Enable. This active-low output signal indicates the bus access is a write and enables external devices to sample the data bus. Its behavior is affected by the WEA and WEN bit fields in the Chip Select Configuration Registers. | EIM_RW | ALT0 | O |
| EIM_WAIT | <p>Ready/Busy/Wait signal. This active-low input signal is asserted by external burst capable devices which support fixed or variable latency of data. It is serviced in synchronous mode only (EIM_CSxGCR1[SWR, SRD] =1). WAIT will have a pull up resistor in pad. The signal indicates whether the External device is ready for data transaction or not. Busy cycles (or wait cycles) of the external device can occur at the start of a Burst access or at page boundary crossover.</p> <p>NOTE: For burst devices, WAIT output should be configured to change one cycle before data is ready (before delay).</p> <p>NOTE: Some External devices may not use this input signal for ready state indication (fix latency without WAIT signal monitoring). For these devices EIM should be configured accordingly (see RFL, WFL, and PSZ field descriptions).</p> <p>NOTE: This is same as what is shown in IP_IND_WAIT_B</p> | EIM_WAIT | ALT0 | I |

22.2.1 Other Important Block I/O Signals Internal to the SoC

The following table provides a description of other signals which are internal to the that are important to understand the function of EIM.

| Name | I/O | Description |
|----------------|-------|---|
| EIM_FB_BCLK | Input | Burst Clock Feedback. This block input is used to sample read data during high transfer speeds. The signal provides feedback from the I/O pad of the BCLK output pin and tends to align more closely with data from the external memory device. |
| EIM_BOOT | Input | EIM Boot Configuration. These block inputs determine the reset state of DSZ[1:0] and MUM. See Table 5-4 for detailed description. |
| ACLK | Input | AXI clock, maximum frequency 133 Mhz |
| IPG_CLK_S | Input | EIM module IPG clock |
| RST_B | Input | Active low HW reset |
| EIM_WARM_RESET | Input | Warm Reset. If this signal is asserted the rst_b will reset only the internal FF and state machine while S/W registers will keep their current state. This signal is active high signal. |

22.3 Clocks

The following table describes the clock sources for EIM. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 22-4. EIM Clocks

| Clock name | Clock Root | Description |
|------------|------------------------|-----------------------------|
| aclk | aclk_eim_slow_clk_root | EIM clock (main) |
| aclk_slow | aclk_eim_slow_clk_root | EIM clock (slow) |
| ipg_clk_s | ipg_clk_root | Peripheral access clock |
| aclk_exsc | aclk_eim_slow_clk_root | EIM clock (external device) |

- **ACLK:** EIM clock (main clock, AXI clock) with a Max frequency of 133Mhz. Can be gated externally when there is no active AXI access.
- **ACLK_SLOW:** EIM all time running ACLK. Used for flip-flops that must be active even when EIM is in low power down mode to provide clock for lpack/lpmd registers, IP registers and IP to AXI sync registers.
- **IPG_CLK_S:** IPG clock for IP accesses. IP registers are activated by ACLK_SLOW clock.
- **ACLK_EXSC:** Clock created from EIM clock for External device usage. Integer division by 1, 2, 3 and 4 of the clock can be use with BCD bit field configuration, according to external devices demands. EIM clock frequency may be reduced for lower frequency support which cannot be achieved via BCD bit field.

22.4 Chip Select Memory Map

Table 22-5. EIM Chip Select Memory Map

| Address | Space Size | Use | Access |
|-----------------------------------|------------|-------------------|--------|
| EIM_NFC_BASE/ACT_CS/ADDRS0 inputs | 128MB | CS0 memory region | R/W |
| ACT_CS/ADDRS1 inputs | 128MB | CS1 memory region | R/W |
| ACT_CS/ADDRS2 inputs | 128MB | CS2 memory region | R/W |
| ACT_CS/ADDRS3 inputs | 128MB | CS3 memory region | R/W |

22.5 Functional Description

This section provides the functional description for the EIM.

22.5.1 Bus Sizing Configuration

The EIM supports byte, half word and word operands allowing access to x8, x16, x32 ports. It can be address/data multiplexed in x16, x32 ports. The port size is programmable via the DSZ bit field in the corresponding Chip Select Configuration Register. An 8-bit port can reside in each one of the bytes of the data bus. A 16-bit port can reside on the lower 16 bits of the data bus, DATA_IN/OUT[15:0] or on the higher 16 bits of the data bus, DATA_IN/OUT[31:16].

In the case of a multi-cycle transfer, the lower two address bits (ADDR[1:0]) are incremented appropriately. The EIM address bus is configured according to DSZ bit field and AUS bits. There is either one bit (for x16 port size) or two bits (for x32 port size) right shift of the address bits (only when AUS=0) and no bit shift when AUS = 1 or DSZ[2] = 1.

The EIM has a data multiplexer which takes the four bytes of the AXI data bus and routes them to their required positions to properly interface to memory.

NOTE

A word access to or from a x16 port requires two external bus cycles to complete the transfer.

A word access to or from a x8 port requires four external bus cycles to complete the transfer.

22.5.1.1 8 BIT PORT SUPPORT

EIM has limited support for mot68000 & intel 386 protocols.

22.5.1.1.1 MOTOROLA 68000

EIM has limited support for mot68000 protocol. Only basic read or write asynchronous operations are supported.

The following operations are not supported:

- Read modify write
- Sync access
- All special accesses (ARM platform space, bus arbitration, bus control, bus error & reset operations)
- FC outputs

22.5.1.1.2 INTEL 386

EIM has limited support for intel 386 protocol. Only basic read or write async non-pipelined operations are supported.

The following operations are not supported:

- Other bus cycles (interrupt, halt & refresh)
- Bus lock
- M/IO, DC, LBA, NA, REFRESH & BS8 signals

22.5.2 EIM Operational Modes

Listed here are the main operational modes for EIM selected by control bit fields settings.

For details, see the bit field descriptions of SWR / SRD / MUM. All modes are supported in with 8-, 16- or 32-bit port configuration, according to DSZ bit field.

Table 22-6. EIM Operation Modes Field Settings

| Control bit fields | | | Brief mode description |
|--------------------|-----|-----|--|
| MUM | SRD | SWR | |
| 0 | 0 | 0 | Asynchronous write / Asynchronous read for APR=0 / Asynchronous page read for APR=1, none multiplexed |
| | | 1 | Synchronous write/ Asynchronous read or APR=0 / Asynchronous page read for APR=1,none multiplexed |
| | 1 | 0 | Asynchronous write/Synchronous read none multiplexed |
| | | 1 | Synchronous write/read none multiplexed |
| 1 | 0 | 0 | Asynchronous write/read multiplexed |
| | | 1 | Synchronous write/ Asynchronous read multiplexed |
| | 1 | 0 | Asynchronous write/Synchronous read multiplexed |
| | | 1 | Synchronous write/read multiplexed |

22.5.3 Burst Mode (Synchronous) Memory Operation

This mode is enabled for read or write access. Bit SWR sets the burst mode for write operations at the corresponding chip select and bit SRD sets it for read operation.

When this mode is set, the controller attempts to translate the Master burst accesses to memory burst accesses, being limited by the memory burst length, predefined by BL value, or memory and Master WRAP/INCR boundary crossing non-matching. Only the first address accessed is put by the controller on the external address bus in a memory burst sequence.

EIM may translate from some Master sequential accesses to one or several memory bursts, but not from two Master individual accesses to one memory burst.

For the first access in a memory burst sequence, the EIM asserts \overline{ADV} , causing the external burst device to latch the starting burst address; then toggle the burst clock (BCLK) for a predefined number of cycles in order to latch the first unit of data. Subsequent accessed data units can then be burst in fewer clock cycles, realizing an overall increase in bus bandwidth.

NOTE

The BCLK signal toggles only when burst access is executed toward the external device (BCM=1'b0 for normal mode use). It runs with a 50% duty cycle until the end of access is reached. When access is terminated, BCLK stops toggling.

Memory burst accesses are terminated by the EIM whenever it detects the following:

- The specific burst length has executed completely (end of access)
- Write access - missing data in write buffer (Master is delaying the data transfer toward the EIM)
- Next sequential access crosses boundary with unequal condition (wrap/increment, burst length) on the Master and memory
- Current memory burst length reached

22.5.4 Burst Clock Divisor (BCD)

In some cases, it may be necessary to slow the external bus in relation to the internal bus to allow accesses to burst devices that have a maximum operating frequency less than the operating frequency of the internal bus.

The internal bus frequency can be divided by one, two, three or four for presentation on the external bus in burst mode operation.

BCLK can only be set to integer divisions of the incoming clock frequency. To get a specific frequency on BCLK, configure the divider to change the incoming EIM clock accordingly.

By programming the BCD bit field to various values, two signals on the external bus are affected; \overline{ADV} and BCLK. The \overline{ADV} signal is asserted according to RADVA or WADVA bit fields programming, and is negated according to the formula mentioned in RADVN and WADVN bit fields description. The BCLK signal runs with a 50% duty cycle until the end of access is reached.

If BCM = 1, the BCLK runs at frequency according to GBCD bit field settings on every async memory access, regardless of the SWR and SRD bits configuration. Caution should be exercised when using BCM bit; GBCD bit field should be updated once and should not change when BCLK is toggling. The BCM bit is used mainly for system debug mode. It has no functional use of the EIM in normal mode.

22.5.5 Burst Clock Start (BCS)

In an effort to allow greater flexibility in achieving the minimum number of wait states on burst accesses, you can determine when you want the BCLK to start toggling after the start of access. This allows the BCLK to be skewed from point of data capture on the EIM clock by any number of EIM clock cycles.

Care must be exercised when setting BCS bit field in conjunction with the BCD and RWSC/WWSC bit fields. See the external timing diagrams in [Burst \(Synchronous Mode\) Read Memory Accesses Timing Diagram - BCD=1](#) and [Burst \(Synchronous Mode\) Read Memory Accesses Timing Diagram - BCD=0](#) for examples of how to use the BCS, BCD and RWSC/WWSC bit fields together.

22.5.6 Multiplexed Address/Data Mode Support

The control bit MUM allows support memory with multiplexed address/data bus both in asynchronous and in synchronous modes.

Caution should be exercised for using OEA/WEA & ADH bit fields. They should be configured according to the external device requirements, as it determines the time point of end of address phase and start of data phase.

22.5.7 Mixed Master/Memory Burst Modes Support

To provide mixed sequential/wrap accesses with different length, EIM interprets burst signal and generate additional \overline{ADV} signals whenever there appear unequal address or burst boundary crossing condition.

BL bit field is used to notify EIM about current memory burst and wrap condition for properly external address generation. In case of non-matching boundaries in both the memory and Master access, EIM starts a new memory burst access by updating address from Master on address bus and generating \overline{ADV} signal.

22.5.8 AXI (Master) Bus Cycles Support

The EIM uses an ARM AXI slave interface. It has a 32-bit bus and supports one access (one ID) at a time. No out of order or parallel accesses are supported.

The following AXI protocol signals are not supported:

- AWLOCK
- AWCACHE
- ARLOCK
- ARCACHE

ARID bus is sampled when:

- new read access is valid on the read address channel and is reflected on the RID bus output toward the master.

AWID bus is sampled when:

- new write access is valid on the write address channel and is reflected on the WID/BID bus output toward the master.

ARPROT and AWPROT signal are partially used. ARPROT[0] and AWPROT[0] bits are used for normal/privileged access detection. ARPROT[2:1] and AWPROT[2:1] are not used.

When sampling a valid access on both of the address channels, the read access will be performed first while write access is pending. After last data transfer completed, the pending write will be executed.

A new access may be executed one cycle after sampling a valid access on the read or write address channels, assuming there is no current access (back to back) which can cause a recovery or end of access penalty cycles, for write access, also assuming data is in write buffer for fast execution.

NOTE

- Only 32-bit word size accesses are supported for burst mode accesses.
- Only 8-bit (1 byte), 16-bit (2 byte) and 32-bit (4 byte) word size supported for single access.
- Maximum number of burst length is 16.
- According to AXI protocol, burst access should not cross 4 KB blocks. In case EIM gets an access that crosses the 4 KB, memory address calculation is invalid.

AXI transfers shown in the table below are also supported. These AXI cycles will be translated into the necessary cycles on the memory side. For example, for optimal operation in case ARM cache is configured to 8 beat burst with wrap, a synchronous flash and cellular RAM memory should be configured in 16 word wrap burst mode when using a 16-bit data port, and in 8 word wrap burst mode when using a 32-bit data port. EIM uses BL bit field to support different memory configurations. The controller splits the transaction when needed in some cases. See [Table 22-8](#).

Table 22-7. AXI Burst Cycles Supported

| Burst Length - Number of data transfers | Burst size - Bytes in transfer | Burst type | Description |
|---|--------------------------------|------------|-----------------|
| 1 | 1 | INCR | Single transfer |

Table continues on the next page...

Table 22-7. AXI Burst Cycles Supported (continued)

| Burst Length - Number of data transfers | Burst size - Bytes in transfer | Burst type | Description |
|---|-----------------------------------|------------|----------------------------|
| 1 | 2 | INCR | Single transfer |
| 1 | 4 | INCR | Single transfer |
| 2 | 4 | WRAP | 2-beat wrapping burst |
| 4 | 4 | WRAP | 4-beat wrapping burst |
| 8 | 4 | WRAP | 8-beat wrapping burst |
| 16 | 4 | WRAP | 16-beat wrapping burst |
| 2 | 4 | INCR | 2-beat incrementing burst |
| 3 | 4 | INCR | 3-beat incrementing burst |
| 4 | 4 | INCR | 4-beat incrementing burst |
| 5 | 4 | INCR | 5-beat incrementing burst |
| 6 | 4 | INCR | 6-beat incrementing burst |
| 7 | 4 | INCR | 7-beat incrementing burst |
| 8 | 4 | INCR | 8-beat incrementing burst |
| 9 | 4 | INCR | 9-beat incrementing burst |
| 10 | 4 | INCR | 10-beat incrementing burst |
| 11 | 4 | INCR | 11-beat incrementing burst |
| 12 | 4 | INCR | 12-beat incrementing burst |
| 13 | 4 | INCR | 13-beat incrementing burst |
| 14 | 4 | INCR | 14-beat incrementing burst |
| 15 | 4 | INCR | 15-beat incrementing burst |
| 16 | 4 | INCR | 16-beat incrementing burst |

Table 22-8. AXI to Memory Burst Splits Number

| AXI Burst Type | Memory Burst Type Config. | # of accesses to X8 Memory Port size | # of accesses to X16 Memory Port size | # of accesses to X32 Memory Port size |
|--------------------------|------------------------------|--|---|--|
| INC16 Aligned Addr. | WRAP4 | 16 | 8 | 4 |
| | Cont. | 1 | 1 | 1 |
| INC16 Unaligned Addr. | WRAP4 | 17 | 9 | 5 |
| | Cont. | 1 | 1 | 1 |
| WRAP16 Aligned Addr. | WRAP16 | 4 | 2 | 1 |
| | Cont. | 1 | 1 | 1 |
| WRAP16 Unaligned Addr. | WRAP16 | 5 | 3 | 1 |
| | Cont. | 2 | 2 | 2 |
| INC8 Aligned Addr. | WRAP8 | 4 | 2 | 1 |
| | WRAP16 | 2 | 1 | 1 |

Table continues on the next page...

Table 22-8. AXI to Memory Burst Splits Number (continued)

| AXI Burst Type | Memory Burst Type Config. | # of accesses to X8 Memory Port size | # of accesses to X16 Memory Port size | # of accesses to X32 Memory Port size |
|-------------------------|---------------------------|---|--|--|
| INC8 Unaligned Addr. | WRAP8 | 4 or 5 | 2 or 3 | 2 |
| | WRAP16 | 2 or 3 | 2 | 1 or 2 |
| WRAP8 Aligned Addr. | WRAP16 | 2 | 1 | 1 |
| | Cont. | 1 | 1 | 1 |
| WRAP8 Unaligned Addr. | WRAP16 | 2 or 3 | 1 | 2 |
| | Cont. | 2 | 2 | 2 |

22.5.9 WAIT_B Signal, RWSC and WWSC bit fields Usage

Most of the external devices supporting burst mode for write or read accesses provide a signal which indicates data is valid on the memory bus (a.k.a. handshake mode). For this mode, RFL and WFL bits should be cleared and RWSC/ WWSC bit fields indicate when the controller should start sampling this signal from the external device or, in other words, how many BCLK cycles should be masked.

For devices which do not use this signal or have a fixed latency ability, the RFL and WFL bits may be set for internal calculation regarding BCLK cycles penalty until data is valid (memory initial access time). For this mode, RWSC/ WWSC indicates when the data is ready for sampling by the controller (read access) or the external device (write access). There is separation between read and write accesses wait-state control. For read access, RWSC bit field is valid and WWSC bit field is ignored; for write access, WWSC is valid and RWSC is ignored.

22.5.10 IPS Register Interface

Access to the registers of the EIM, read or write, is made with IPS protocol signals. The system should avoid changing the registers while master/memory transaction is valid, as this can cause an unknown behavior of the controller.

Register access size is 32-bit as the register size definition, other size of access (byte or half word) is not supported.

22.5.11 MRS Set for PSRAM

Memory registers of PSRAM devices can be configured according to external signal, which indicates whether the access is to a memory array or memory register domain.

When the CRE bit is set, the following transactions to the external device will assert the CRE signal. The polarity of this signal is determined by the CREP bit for active low or active high assertion of the signal.

22.5.12 EIM Access Termination

EIM is monitoring the corresponding CSx control signal every time variable latency access or dtack access is performed toward the external device.

In variable latency accesses, the Watchdog Timer (WDOG-1) counts BCLK cycles. If it reaches the wdog_limit (according to the WDOG_LIMIT bit field in the WCR) before the device signals can drive/sample new data, the controller will terminate the access and generate an error response transfer toward the Master.

In dtack access, WDOG-1 counts ACLK cycles instead of BCLK and it reaches the wdog_limit before the device asserts the dtack signal, the controller will terminate the access and generate an error response transfer toward the Master.

WDOG-1 can be disabled by WDOG_EN bit in the WCR.

22.5.13 Error Conditions

The following conditions cause an error (AXI error or IPS error) response signal:

- AXI errors
 - Access to a disabled chip select - access to a mapped chip select address space where the CSEN bit in the corresponding chip select Configuration Register is clear
 - Access to a non mapped address - access to an address that is not mapped to any CS.
 - User access to a supervisor-protected chip select address space (the SP bit in the corresponding chip select Configuration Register is set)
 - User access in fixed mode access
 - User performs write access to write protected chip select
 - First write data ID and write address ID do not match. (No data is written to the memory.)

- First Write Data ID and write address ID match but one or more of the other Write data IDs does not match the First Write data ID (data is written to memory according)
- Access duration to external device from CSx signal assertion is 128/256/512/1024 cycles (access is terminated by the controller) - This error can be disabled by software.
- IPS errors
 - User read or write access to a reserved/non-valid address in the EIM Configuration Register

22.5.14 DTACK Mode

In DTACK mode, the EIM uses DTACK signal as an indication of when to end the access.

DTACK is an asynchronous edge/level sensitive signal. DTACK polarity is configurable by the DAP bit in CsxGCR2 (default value is 0).

In this case, EIM begins the access and after a few cycles (according DAPS field) and waits until DTACK (after synchronization) becomes asserted, then samples the data in read access and completes the current data access (see [Figure 22-15](#), [Figure 22-16](#) & [Figure 22-17](#)).

If more than one data is needed, CS will be negated between access (CSREC field is not zero) and the AXI burst access will be split into single accesses (see [Figure 22-19](#)).

22.5.15 RDY_INT Signal as Interrupt

The EIM has an external interrupt support. When INTEN bit in the WCR is set, signal RDY_INT is used as interrupt; its status is being reflected by INT bit and output signal.

It is cleared by writing one to the INT bit. When INTEN is cleared, the interrupt is disabled. This interrupt is a level interrupt and its polarity can be configured by the INTPOL bit in the WCR.

22.5.16 RDY_INT Signal as Ready After Reset Indication

This feature is used for boot propose from external devices based on NANDFlash array memory with NORFlash interface.

When ERRST bit is set, RDY_INT signal is monitored to determine ready after reset of the external device located on CS0.

The monitoring is taking place when CS0 is accessed for the first time. The access will be pending until assertion of the signal is detected. When detection occurs, ERRST bit is self-cleared and pending access is executed to the external device on CS0.

22.5.17 EIM_GRANT / EIM_BUSY Handshake Description

Prior to executing command to one of the external device (chip select), EIM assert EIM_BUSY signal (1'b1) and checks the EIM_GRANT signal status.

If EIM_GRANT signal is high, it indicates external data bus is not used by other slaves (NAND Flash Controller) and EIM may start to execute the access. If EIM_GRANT is low, EIM waits until it is set (1'b1) before executing the access.

EIM keeps EIM_BUSY signal set until it completes the access toward the external device.

Once EIM_GRANT signal is set, it can not be reset until EIM_BUSY signal is cleared by EIM.

NOTE

In 16-bit Muxed EIM doesn't use the data bus, therefore there is no sharing of the data bus with NFC. EIM doesn't wait for EIM_GRANT signal from NFC and doesn't assert the EIM_BUSY signal.

22.5.18 LPMD / LPACK Handshake Description

These signals are used for frequency and/or voltage change, and for entering low power mode during normal operation of the EIM. Before any change can take place, the controller and all the relevant external devices should be in idle state, which means no access or data transfer is in process.

LPMD input signal is asserted once EIM detects the assertion of LPMD, all ready signals of the AXI channels are negated, and EIM is not sampling new accesses. It finishes all the ongoing accesses and already pending ones. When EIM is in idle state, the LPACK output signal is asserted. EIM will stay in idle state and the LPACK signal will stay asserted until the LPMD signal is negated.

22.5.19 Endianness

Big and Little endianness are supported by the controller according to the following table.

Table 22-9. EIM Out/in Data in Case AXI Out/in Data is 0xB3B2B1B0

| Endian mode | AXI access | AXI address [1:0] | Port size and used bits | | | | | | | | |
|-------------|------------|-------------------|-------------------------|---------|--------|-------|----------------------|------------------|-----------------|------------------------|------------------------------------|
| | | | Word port | | | | Half word port | | | Byte port | |
| | | | [31:24] | [23:16] | [15:8] | [7:0] | External address [0] | [31:24] ([15:8]) | [23:16] ([7:0]) | External address [1:0] | [31:24] ([23:16]) ([15:8]) ([7:0]) |
| Big | Word | 0 | 0xB3 | 0xB2 | 0xB1 | 0xB0 | 0 | 0xB3 | 0xB2 | 0 | 0xB3 |
| | | | | | | | | | | 1 | 0xB2 |
| | | | | | | | 1 | 0xB1 | 0xB0 | 2 | 0xB1 |
| | | | | | | | | | | 3 | 0xB0 |
| | Half Word | 0 | | | 0xB1 | 0xB0 | 0 | 0xB3 | 0xB2 | 0 | 0xB3 |
| | | | | | | | | | | 1 | 0xB2 |
| | | 2 | 0xB3 | 0xB2 | | | 1 | 0xB1 | 0xB0 | 2 | 0xB1 |
| | | | | | | | | | | 3 | 0xB0 |
| | Byte | 0 | | | | 0xB0 | 0 | | 0xB3 | 0 | 0xB3 |
| | | 1 | | | 0xB1 | | | 0xB2 | | 1 | 0xB2 |
| | | 2 | | 0xB2 | | | 1 | | 0xB1 | 2 | 0xB1 |
| | | 3 | 0xB3 | | | | | 0xB0 | | 3 | 0xB0 |
| Little | Word | 0 | 0xB3 | 0xB2 | 0xB1 | 0xB0 | 0 | 0xB1 | 0xB0 | 0 | 0xB0 |
| | | | | | | | | | | 1 | 0xB1 |
| | | | | | | | 1 | 0xB3 | 0xB2 | 2 | 0xB2 |
| | | | | | | | | | | 3 | 0xB3 |
| | Half Word | 0 | | | 0xB1 | 0xB0 | 0 | 0xB1 | 0xB0 | 0 | 0xB0 |
| | | | | | | | | | | 1 | 0xB1 |
| | | 2 | 0xB3 | 0xB2 | | | 1 | 0xB3 | 0xB2 | 2 | 0xB2 |
| | | | | | | | | | | 3 | 0xB3 |
| | Byte | 0 | | | | 0xB0 | 0 | | 0xB0 | 0 | 0xB0 |
| | | 1 | | | 0xB1 | | | 0xB1 | | 1 | 0xB1 |
| | | 2 | | 0xB2 | | | 1 | | 0xB2 | 2 | 0xB2 |
| | | 3 | 0xB3 | | | | | 0xB3 | | 3 | 0xB3 |

22.5.20 Strobe Signal Use

The strobe signal is toggling according to address/data valid condition on the external bus for read and write accesses, and for both synchronous and asynchronous modes.

At any time point when address/data is valid on the external bus, the strobe signal will generate a positive edge, which can be used to sample the external data and control signal.

NOTE

Strobe signal for read data is active (RL + 1) cycles after data on external bus is valid.

22.6 Initialization Information

22.6.1 Booting from EIM

EIM is ready to work with CS0 after the hardware reset, but it has been configured for very slow access (for boot purposes), with additional setup and hold time.

Other CSs are disabled by hardware reset. Therefore, all CSs must be properly initialized before use in writing values to the corresponding chip select configuration registers.

DSZ[1:0] and MUM fields are set according to EIM_BOOT [2:0] block inputs.

22.7 Typical Application

Application note uses following functions to illustrate EIM and memory accesses:

- WR16(address, data) is a 16 bit write access
- WR32(address, data) is a 32 bit write access
- RD16(address, data) is a 16 bit read access
- RD32(address, data) is a 32 bit read access
- WR_I(address, data, delta, counter) is a write data sequence, there $\text{data}(i+1) = \text{data}(i) + \text{delta}$
- COMMAND_SEQUENCE
- CHECK_STATUS

NOTE

COMMAND_SEQUENCE and CHECK_STATUS are described in [AMD Flash Utility](#), [Intel Sibley Flash Utility](#), [MDOC Device Utility](#), [Samsung OneNAND Utility](#), and [Spansion Flash Utility](#).

All addresses are byte addresses. "CS0" is a Chip Select 0 base address. "EIM_" is a prefix of EIM's registers. 'h' is a prefix of hexadecimal constant. "///" is a comment beginning. csba[cs] is a dimension of CS base addresses. "addr" means an address offset in current CS address space. Examples use CS0 address space, but it may apply to any CS except for boot mode functionality.

Configuration examples were verified with the memory models listed below and may require some adjustments for other family members.

22.7.1 Access to AMD Flash

The following mentioned configurations are intended for AMD Simultaneous Flash Memory w/ VersatileIO™ Control.

22.7.1.1 AMD Flash Asynchronous Mode Configuration

EIM register configuration used for AMD flash asynchronous access:

- WR32('EIM_CS0RCR1,'h0a018000);
- WR32('EIM_CS0WCR1,'h0704a240);
- WR32('EIM_CS0GCR1,'h00430081); // for 32 bit memory
- WR32('EIM_CS0GCR1,'h00410081); // for 16 bit memory

22.7.1.2 AMD Flash Utility

```
// Single data word programming to addr, 32-bit memory
port_size = 32;
WR32('CS0+('h0555<<2),'h00aa); // command sequence
WR32('CS0+('h02aa<<2),'h0055);
WR32('CS0+('h0555<<2),'ha0); // command code
WR32('CS0+addr, data); // addr & data
// Polling end of programming
edata = data; // expected data
data = ~edata;
errst = 0;
while(!(data == edata) &&!errst)
begin: BR_EN
RD16('CS0+addr, data); // Read status
if(data[7] != edata[7])
begin
if(data[5] == 1)
begin
RD16('CS0+addr, data3);
RD16('CS0+addr, data);
if(data[6] != data3[6])
begin
$display("CHECK_STATUS: Error timeout on single data program");
errst = 1;
disable BR_EN;
end
end
end
```

```

        end
    end
else
    begin
        RD16('CS0+addr, data3);
        if(port_size == 32)
            RD32('CS0+addr, data);
        else
            begin
                RD16('CS0+addr, data);
                edata[31:16] = 16'h0;
            end
        if(data != edata)
            begin
                $display("CHECK_STATUS: Error in data write on single data program");
                errst =2;
                disable BR_EN;
            end
        end
    end
end
// Single data word programming to addr, 16-bit memory
port_size = 16;
WR32('CS0+('h0555<<1), 'h00aa); // command sequence
WR32('CS0+('h02aa<<1), 'h0055);
WR32('CS0+('h0555<<1), 'ha0); // commund code
WR32('CS0+addr, data); // addr & data
// Polling end of programming - the same as for 32 bit

```

22.7.2 Access to Intel Sibley Flash

The following configurations are intended to Sibley family muxed and non-muxed devices.

22.7.2.1 Intel Sibley Flash Asynchronous Mode Configuration

- WR32('EIM_CS0GCR1, 'h00210081);
- WR32('EIM_CS0RCR1, 'h0e020000);
- WR32('EIM_CS0RCR2, 'h00000000);
- WR32('EIM_CS0WCR1, 'h0704a040);

22.7.2.2 Intel Sibley Flash Synchronous Mode Configuration

Configuration used for 133 MHz synchronous access to flash:

```

// Set memory to synchronous read mode
WR16('CS0+('h5903<<1), 'h0060);
WR16('CS0+('h5903<<1), 'h0003);
WR16('CS0+('h0000<<1), 'h00ff);
// Set EIM configuration to synchronous timing
WR32('EIM_CS0GCR1, 'h50214225); // 133 MHz
WR32('EIM_CS0RCR1, 'h0c000000); // 12 cycles on memory

```

Configuration used for 66 MHz synchronous access to muxed flash:

Typical Application

```
// Set memory to synchronous read mode
WR16('CS0+('h3103<<1), 'h0060);
WR16('CS0+('h3103<<1), 'h0003);
WR16('CS0+('h0000<<1), 'h00ff);

//-----
// Set EIM configuration to synchronous timing
WR32('EIM_CS0GCR1, 'h5021122d);           // 66 MHz
WR32('EIM_CS0RCR1, 'h07000000);           // 7cycles on memory
```

22.7.2.3 Intel Sibley Flash Utility

```
// Single data word programming to addr
WR16('CS0+addr, 'h0060);           // Unlock
WR16('CS0+addr, 'h00d0);
WR16('CS0+addr, 'h0041);
WR16('CS0+addr, data);
WR16('CS0+caddr, 'h0070);           // Read Status command
while('CS0+data[7] == 0)             // Wait / Polling
    RD16('CS0+addr, data);           // Read status
RD16('CS0+addr, data);               // Read status
WR16('CS0+'h0000, 'h00ff);

// Write buffer programming
WR16('CS0+addr, 'h0060);           // Unlock
WR16('CS0+addr, 'h00d0);
data = 0;
WR16('CS0+addr, 'h0070);           // Read Status command
while(data[7] == 0)                 // Wait
    RD16('CS0+addr, data);           // Read status
WR16('CS0+'h0000, 'h00ff);
WR16('CS0+addr, 'h00e9);           // Write Buffer command
WR16('CS0+addr, 255);               // Word counter (<256)
for(i=0; i<'h200; i = i + 'h40)
    WR_I('CS0+addr+i, data+((i>2)*'h0010_0001), 'h0010_0001, 16); // Data
WR16('CS0+addr, 'h00d0);           // Write Confirm command
data = 0;
while(data[7] == 0)                 // Wait
    RD16('CS0+addr, data);           // Read status
RD16('CS0+addr, data);               // Read status
WR16('CS0+'h0000, 'h00ff);
```

22.7.3 Access to MDOC Device

The following configurations are intended to MDOC H3 device.

22.7.3.1 MDOC Device Boot

To boot from the MDOC device the ERRST bit should be configured to 1, so that EIM will hold the first read access to CS0 until the MDOC asserts the RDY signal.

22.7.3.2 MDOC Device Asynchronous Mode Configuration

```
// Non-muxed mode
WR32('EIM_CS0GCR1, 'h00410081);
WR32('EIM_CS0RCR1, 'h0e121010);
```

```

WR32('EIM_CS0RCR2','h00000000');
WR32('EIM_CS0WCR1','h12092492');
// Muxed mode
WR32('EIM_CS0GCR1','h00410081');
WR32('EIM_CS0RCR1','h0e121010');
WR32('EIM_CS0RCR2','h00000000');
WR32('EIM_CS0WCR1','h12092492');

```

22.7.3.3 MDOC Device Utility

```

// Read Manufacturer ID and Device ID
RE16('CS0+'h9400,'h4833');
RE16('CS0+'h9422,'hb7cc');

```

22.7.4 Access to Micron PSRAM

The following configurations are intended to mt45w4mw16bfb_706.

22.7.4.1 Micron PSRAM Asynchronous Mode Configuration

```

// 16 bit memory
WR32('EIM_CS0GCR1','h403104b1');
WR32('EIM_CS0RCR1','h0b010000');
WR32('EIM_CS0RCR2','h00000008');
WR32('EIM_CS0WCR1','h0b040040');
// 32 bit memory
WR32('EIM_CS0GCR1','h403304b1');
WR32('EIM_CS0RCR1','h0f010000');
WR32('EIM_CS0RCR2','h00000008');
WR32('EIM_CS0WCR1','h0f040040');

```

22.7.4.2 Micron PSRAM Synchronous Mode Configuration

```

// 16 bit memory
WR32('EIM_CS0GCR1','h403104b1');
WR32('EIM_CS0WCR1','h0b040000');
WR16('CS0+('h85947<<1),'h0040'); // memory configuration
WR32('EIM_CS0GCR1','h4021_5487'); // fixed latency memory wrap 4
WR32('EIM_CS0RCR1','h04000000');
WR32('EIM_CS0RCR2','h00000008');
WR32('EIM_CS0WCR1','h04000000');
// 32 bit memory
WR32('EIM_CS0GCR1','h6003_04f1');
WR32('EIM_CS0WCR1','h0b04_0000');
WR32('CS0+('h85947<<2),'h0040'); // memory configuration
WR32('EIM_CS0GCR1','h4003_1487'); // var latency memory inc. page size 128
WR32('EIM_CS0RCR1','h04000000');
WR32('EIM_CS0RCR2','h00000008');
WR32('EIM_CS0WCR1','h04000000');

```

22.7.5 Access to Samsung OneNAND

Mentioned below are the configurations intended for Samsung OneNAND muxed and non-muxed devices.

22.7.5.1 Samsung OneNAND Boot

There are two ways to boot from Samsung OneNAND. In the first way, the ERRST bit is set to 0 and the user has to poll the interrupt status in the OneNAND interrupt register (or set interrupt handler there). In the second way, the ERRST bit is set to 1 and the user should enable the device interrupt output before the first read from CS0 access is issued.

Load sectors 2,3 to DataRAM, page 0 done in the next example:

- WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
- WR16('CS0+('hF100<<1),'h0); // block[8:0] address
- WR16('CS0+('hF107<<1),'h2); // sector[1:0] and page[7:2] addresses
- WR16('CS0+('hF200<<1),'h802); // buffer[11:8] address and counter[1:0]
- WR16('CS0+('hF101<<1),'h0); // DDP choose
- WR16('CS0+('hF220<<1),'h0); // Set command

22.7.5.2 Samsung OneNAND Asynchronous Mode Configuration

```
// Non-muxed memory
WR32('EIM_CS0GCR1,'h00410081);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h0c092480);
// Muxed memory
WR32('EIM_CS0GCR1,'h00410089);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h0c092480);
```

22.7.5.3 Samsung OneNAND Synchronous Mode Configuration

Set memory and EIM to synchronous read mode is shown in the next example:

```
WR16('CS0+('hF221<<1),'hc0e0); // Synchronous read, 4 clk latency
WR32('EIM_CS0GCR1,'h50412405); // 44 MHz (non-muxed)
WR32('EIM_CS0RCR1,'h05010000);
```

The muxed Samsung OneNAND supports synchronous write, too:

```
// Set memory & EIM to synchronous read and write mode
WR16('CS0+('hF221<<1),'hc0f2); // Sync. read and write, 4 clk latency
WR32('EIM_CS0GCR1,'h5041240f); // 44 MHz
WR32('EIM_CS0RCR1,'h05010000);
WR32('EIM_CS0WCR1,'h05040000);
```

22.7.5.4 Samsung OneNAND Utility

The following utility algorithms are used on the Samsung OneNAND:

```
// Unlock Block command
WR16('CS0+('hF100<<1), 'h0);          // DFS
WR16('CS0+('hF100<<1), 'h0);          // DBS
WR16('CS0+('hF24c<<1), 'h2);          // SBA - block number (2)
WR16('CS0+('hF241<<1), 'h0);          // Clear interrupt status
WR16('CS0+('hF220<<1), 'h23);          // Unlock command
data = 'h0;
while(!(data &'h0004))                  // Polling
    RD32('WIAR, data); // Read status
// Erase block command
WR16('CS0+('hF100<<1), 'h2);          // DFS and block ([8:0]) address
WR16('CS0+('hF101<<1), 'h0);          // DBS
WR16('CS0+('hF241<<1), 'h0);          // Clear interrupt status
WR16('CS0+('hF220<<1), 'h94);          // Erase command
data = 'h0;
while(!(data &'h0004))                  // Wait
    RD32('WIAR, data); // Read status
// Program page command
WR16('CS0+('hF100<<1), 'h2);          // DFS and block[8:0] address
WR16('CS0+('hF107<<1), 'h0);          // sector[1:0] and page[7:2] addresses
WR16('CS0+('hF200<<1), 'h800);          // buffer[11:8] address and counter[1:0]
WR16('CS0+('hF241<<1), 'h0);          // Clear interrupt status
WR16('CS0+('hF220<<1), 'h80);          // Program command
data = 'h0;
while(!(data &'h0004))                  // Wait
    RD32('WIAR, data); // Read status
```

22.7.6 Access to Samsung UtRAM

Below mentioned configurations are intended for Samsung UtRAM.

22.7.6.1 Samsung UtRAM Asynchronous Mode Configuration

```
WR32('EIM_CS0GCR1, 'h400104b1);
WR32('EIM_CS0RCR1, 'h0a010000);
WR32('EIM_CS0RCR2, 'h00000008);
WR32('EIM_CS0WCR1, 'h0b040040);
```

22.7.6.2 Samsung UtRAM Synchronous Mode Configuration

```
RD16('CS0+('hff_ffff<<1), data);      // command sequence
RD16('CS0+('hff_ffff<<1), data);
RD16('CS0+('hff_ffff<<1), data);
RD16('CS0+('hff_feff<<1), data);
RD16('CS0+('h00_82a0<<1), data);        // memory sync. configuration
WR32('EIM_CS0GCR1, 'h4021_53b7);        // fixed latency memory wrap 32
WR32('EIM_CS0RCR1, 'h0500_0000);
WR32('EIM_CS0WCR1, 'h0300_0000);
```

22.7.7 Access to Spansion Flash

Below mentioned configurations are intended for Spansion Flash.

22.7.7.1 Spansion Flash Asynchronous Mode Configuration

```

WR32('EIM_CS0GCR1','h00410081);
WR32('EIM_CS0RCR1','h0a018000);
WR32('EIM_CS0RCR2','h00000000);
WR32('EIM_CS0WCR1','h0704a240);
WR16('CS0+('hF220<<1),'h94);          // Erase command
    data = 'h0;
    while(!(data &'h0004))                // Wait
        RD32('WIAR, data); // Read status
// Program page command
WR16('CS0+('hF100<<1),'h2);                // DFS and block[8:0] address
WR16('CS0+('hF107<<1),'h0);                // sector[1:0] and page[7:2] addresses
WR16('CS0+('hF200<<1),'h800);              // buffer[11:8] address and counter[1:0]
WR16('CS0+('hF241<<1),'h0);                // Clear interrupt status
WR16('CS0+('hF220<<1),'h80);                // Program command
    data = 'h0;
    while(!(data &'h0004))                // Wait
        RD32('WIAR, data); // Read status

```

22.7.7.2 Spansion Flash Synchronous Mode Configuration

```

WR16('CS0+('h0555<<1),'h00aa);    // command sequence
WR16('CS0+('h02aa<<1),'h0055);
WR16('CS0+('h0555<<1),'hd0);
WR16('CS0+('h0000<<1),'h1ec4);    // memory sync. configuration
WR32('EIM_CS0GCR1','h50411325); // 66 MHz
WR32('EIM_CS0RCR1','h05000000); // 5 cycles on memory

```

22.7.7.3 Spansion Flash Utility

```

// Single word programming
COMMAND_SEQUENCE(cs,16,'ha0);          // single word programming
WR16('CS0+addr, data);
CHECK_STATUS('CS0+addr,data,16,1,errst);
// Write buffer programming
COMMAND_SEQUENCE(0,16,'h25);           // write buffer programming
WR16('CS0+addr,'h001f);                 // counter-1
WR_I('CS0+addr, data, 'h0010_0001, 16); // data
WR16('CS0+addr,'h0029);                 // write buffer to flash
CHECK_STATUS('CS0+addr+'h3e,data[31:16]+'h00f0,16,1,errst);

```

There `COMMAND_SEQUENCE` and `CHECK_STATUS` are next functions:

```

task COMMAND_SEQUENCE;
    input[2:0]    cs;
    input[7:0]    port_size;
    input[31:0]   code;
begin
    if(port_size == 16)

```

```

        begin
            WR16(csba[cs] + ('h0555<<1), 'h00aa);
            WR16(csba[cs] + ('h02aa<<1), 'h0055);
            WR16(csba[cs] + ('h0555<<1), code);
        end
    else
        begin
            WR32(csba[cs] + ('h0555<<2), 'h00aa);
            WR32(csba[cs] + ('h02aa<<2), 'h0055);
            WR32(csba[cs] + ('h0555<<2), code);
        end
    end
endtask
task    CHECK_STATUS;
    input[31:0] addr;
    input[31:0] edata;
    input[7:0]   port_size;
    input[7:0]   opcode;

```

22.7.8 8 bit support

This section details the pin connections for Intel mode and Motorola mode.

Intel Mode - For intel mode use the following connection:

Table 22-10. Intel Mode pin connections

| ARM platform Pin | EIM Pin | Notes |
|------------------|--------------|-----------------|
| ADS# | IPP_DO_ADV_B | WAL = 1,RAL = 1 |
| W/R | IPP_DO_BE_B | WBED = 1 |
| WR# | WE# | |
| RD# | OE# | |

Mot. Mode - For intel mode use the following connection:

Table 22-11. Motorola Mode pin connections

| ARM platform Pin | EIM Pin | Notes |
|------------------|-------------|-------|
| AS# | IPP_DO_CS_B | |
| R/W# | WE# | |
| LDS# | BE# | |

22.8 External Bus Timing Diagrams

The following timing diagrams show the timing of accesses to memory or a peripheral with different timing parameters. All examples done for CS0, but are valid for any others chip select. BE means one from current used BE[3:0].

22.9 EIM Memory Map/Register Definition

The EIM includes 33 user-accessible 32-bit registers. The the EIM Configuration Register (EIM_WCR) contains control bits that configure the EIM for certain operation modes.

The 160 bits used to control Individual Chip Select are divided into five registers:

- Chip Select n General Configuration Register 1 (EIM_CSnGCR1)
- Chip Select n General Configuration Register 2 (EIM_CSnGCR2)
- Chip Select n Read Configuration Register 1 (EIM_CSnRCR1)
- Chip Select n Read Configuration Register 2 (EIM_CSnRCR2)
- Chip Select n Write Configuration Register (EIM_CSnWCR)

In addition there are 3 general registers: EIM_WCR, EIM_WIAR & EIM_EAR.

NOTE

- All EIM registers are sampled by IPG_CLK_S, therefore IPG_CLK_S must be active when accessing through IP bus.
- Read access from all registers (except EIM_WIAR & EIM_EAR) will generate one IPG_XFR_WAIT cycle.
- Read access from EIM_WIAR & EIM_EAR will generate six IPG_XFR_WAIT cycles.
- Write access to all registers (except EIM_EAR) will generate three IPG_XFR_WAIT cycles.
- Write access to EIM_EAR will generate six IPG_XFR_WAIT cycles.

EIM memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |
|------------------------|--|-----------------|--------|-------------|-----------------------------|
| 21B_8000 | Chip Select n General Configuration Register 1 (EIM_CS0GCR1) | 32 | R/W | 0061_0088h | 22.9.1/1054 |
| 21B_8004 | Chip Select n General Configuration Register 2 (EIM_CS0GCR2) | 32 | R/W | 0000_1010h | 22.9.2/1058 |

EIM_CSnGCR1 field descriptions

| Field | Description |
|--------------|--|
| 31–28 PSZ | <p>Page Size. This bit field indicates memory page size in words (word is defined by the DSZ field). PSZ is used when fix latency mode is applied, WFL=1 for sync. write accesses, RFL=1 for sync. Read accesses. When working in fix latency mode WAIT signal from the external device is not being monitored, PSZ is used to determine if page boundary is reached and renewal of access is preformed. This bit field is ignored when sync. Mode is disabled or fix latency mode is not being used for write or read access separately.</p> <p>It can be valid for both access type, read or write, or only for one type, according to configuration. PSZ is cleared by a hardware reset.</p> <p>0000 8 words page size 0001 16 words page size 0010 32 words page size 0011 64 words page size 0100 128 words page size 0101 256 words page size 0110 512 words page size 0111 1024 (1k) words page size 1000 2048 (2k) words page size 1001 - 1111 Reserved</p> |
| 27 WP | <p>Write Protect. This bit prevents writes to the address range defined by the corresponding chip select. WP is cleared by a hardware reset.</p> <p>0 Writes are allowed in the memory range defined by chip. 1 Writes are prohibited. All attempts to write to an address mapped by this chip select result in a error response and no assertion of the chip select output.</p> |
| 26–24 GBC | <p>Gap Between Chip Selects. This bit field, according to the settings shown below, determines the minimum time between end of access to the current chip select and start of access to different chip select. GBC is cleared by a hardware reset.</p> |

Table continues on the next page...

EIM_CSnGCR1 field descriptions (continued)

| Field | Description |
|----------------|--|
| | <p>Example settings:</p> <p>000 minimum of 0 EIM clock cycles before next access from different chip select (async. mode only)</p> <p>001 minimum of 1 EIM clock cycles before next access from different chip select</p> <p>010 minimum of 2 EIM clock cycles before next access from different chip select</p> <p>111 minimum of 7 EIM clock cycles before next access from different chip select</p> |
| 23 AUS | <p>Address UnShifted. This bit indicates an unshifted mode for address assertion for the relevant chip select accesses. AUS bit is cleared by hardware reset.</p> <p>0 Address shifted according to port size (DSZ config.)</p> <p>1 Address unshifted</p> |
| 22–20 CSREC | <p>CS Recovery. This bit field, according to the settings shown below, determines the minimum pulse width of CS, OE, and WE control signals before executing a new back to back access to the same chip select. CSREC is cleared by a hardware reset.</p> <p>NOTE: The reset value for EIM_CS0GCR1, CSREC[2:0] is 0b110. For EIM_CS1GCR1 - EIM_CS5GCR, the reset value is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles minimum width of CS, OE and WE signals (read async. mode only)</p> <p>001 1 EIM clock cycles minimum width of CS, OE and WE signals</p> <p>010 2 EIM clock cycles minimum width of CS, OE and WE signals</p> <p>111 7 EIM clock cycles minimum width of CS, OE and WE signals</p> |
| 19 SP | <p>Supervisor Protect. This bit prevents accesses to the address range defined by the corresponding chip select when the access is attempted in the User mode. SP is cleared by a hardware reset.</p> <p>0 User mode accesses are allowed in the memory range defined by chip select.</p> <p>1 User mode accesses are prohibited. All attempts to access an address mapped by this chip select in User mode results in an error response and no assertion of the chip select output.</p> |
| 18–16 DSZ | <p>Data Port Size. This bit field defines the width of an external device's data port as shown below.</p> <p>NOTE: Only async. access supported for 8 bit port.</p> <p>NOTE: The reset value for EIM_CS0GCR1, DSZ[2] = 0, DSZ[1:0] = EIM_BOOT[1:0]. For EIM_CS1GCR1 - EIM_CS5GCR1, the reset value is 0b001.</p> <p>000 Reserved.</p> <p>001 16 bit port resides on DATA[15:0]</p> <p>010 16 bit port resides on DATA[31:16]</p> <p>011 32 bit port resides on DATA[31:0]</p> <p>100 8 bit port resides on DATA[7:0]</p> <p>101 8 bit port resides on DATA[15:8]</p> <p>110 8 bit port resides on DATA[23:16]</p> <p>111 8 bit port resides on DATA[31:24]</p> |
| 15–14 BCS | <p>Burst Clock Start. When SRD=1 or SWR=1, this bit field determines the number of EIM clock cycles delay from start of access before the first rising edge of BCLK is generated.</p> <p>When BCD=0 value of BCS=0 results in a half clock delay after the start of access. For other values of BCD a one clock delay after the start of access is applied, not an immediate assertion. BCS is cleared by a hardware reset.</p> <p>00 0 EIM clock cycle additional delay</p> |

Table continues on the next page...

EIM_CS n GCR1 field descriptions (continued)

| Field | Description |
|--------------|--|
| | 01 1 EIM clock cycle additional delay 10 2 EIM clock cycle additional delay 11 3 EIM clock cycle additional delay |
| 13–12 BCD | Burst Clock Divisor. This bit field contains the value used to program the burst clock divisor for BCLK generation. It is used to divide the internal EIMbus frequency. BCD is cleared by a hardware reset. NOTE: For other than the mentioned below frequency such as 104 MHz, EIM clock (input clock) should be adjust accordingly. 00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4 |
| 11 WC | Write Continuous. The WI bit indicates that write access to the memory are always continuous accesses regardless of the BL field value. WI is cleared by hardware reset. 0 Write access burst length occurs according to BL value. 1 Write access burst length is continuous. |
| 10–8 BL | Burst Length. The BL bit field indicates memory burst length in words (word is defined by the DSZ field) and should be properly initialized for mixed wrap/increment accesses support. Continuous BL value corresponds to continuous burst length setting of the external memory device. For fix memory burst size, type is always wrap. In case not matching wrap boundaries in both the memory (BL field) and Master access on the current address, EIM update address on the external device address bus and regenerates the access. BL is cleared by a hardware reset. When APR=1, Page Read Mode is applied, BL determine the number of words within the read page burst. BL is cleared by a hardware reset for EIM_CS0GCR1 - EIM_CS5GCR1. 000 4 words Memory wrap burst length (read page burst size when APR = 1) 001 8 words Memory wrap burst length (read page burst size when APR = 1) 010 16 words Memory wrap burst length (read page burst size when APR = 1) 011 32 words Memory wrap burst length (read page burst size when APR = 1) 100 Continuous burst length (2 words read page burst size when APR = 1) 101 Reserved 110 Reserved 111 Reserved |
| 7 CREP | Configuration Register Enable Polarity. This bit indicates CRE memory pin assertion state, active-low or active-high, while executing a memory register set command to the external device (PSRAM memory type). CREP is set by a hardware reset. NOTE: Whenever PSRAM is connected the CREP value must be correct also for accesses where CRE is disabled. For Non-PSRAM memory CREP value should be 1. 0 CRE signal is active low 1 CRE signal is active high |
| 6 CRE | Configuration Register Enable. This bit indicates CRE memory pin state while executing a memory register set command to PSRAM external device. CRE is cleared by a hardware reset. |

Table continues on the next page...

EIM_CSnGCR1 field descriptions (continued)

| Field | Description |
|-----------|--|
| | 0 CRE signal use is disable 1 CRE signal use is enable |
| 5 RFL | <p>Read Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start sampling data according to RWSC field, it only valid in synchronous mode. RFL is cleared by a hardware reset.</p> <p>When RFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device.</p> 0 the External device WAIT signal is being monitored, and it reflect the external data bus state 1 the state of the External devices is determined internally (Fix latency mode only) |
| 4 WFL | <p>Write Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start data transfer according to WWSC field, it only valid in synchronous mode. WFL is cleared by a hardware reset.</p> <p>When WFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device</p> 0 the External device WAIT signal is being monitored, and it reflect the external data bus state 1 the state of the External devices is determined internally (Fix latency mode only) |
| 3 MUM | <p>Multiplexed Mode. This bit determines the address/data multiplexed mode for asynchronous and synchronous accesses for 8 bit, 16 bit or 32 bit devices (DSZ config. dependent).</p> <p>NOTE: The reset value for EIM_CS0GCR1[MUM] = EIM_BOOT[2]. For EIM_CS1GCR1 - EIM_CS5GCR1 the reset value is 0.</p> 0 Multiplexed Mode disable 1 Multiplexed Mode enable |
| 2 SRD | <p>Synchronous Read Data. This bit field determine the read accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SRD is cleared by a hardware reset.</p> <p>NOTE: Sync. accesses supported only for 16/32 bit port.</p> 0 read accesses are in Asynchronous mode 1 read accesses are in Synchronous mode |
| 1 SWR | <p>Synchronous Write Data. This bit field determine the write accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SWR is cleared by a hardware reset.</p> <p>NOTE: Sync. accesses supported only for 16/32 bit port.</p> 0 write accesses are in Asynchronous mode 1 write accesses are in Synchronous mode |
| 0 CSEN | <p>CS Enable. This bit controls the operation of the chip select pin. CSEN is set by a hardware reset for CSGCR0 to allow external boot operation. CSEN is cleared by a hardware reset to CSGCR1-CSGCR5.</p> <p>NOTE: Reset value for EIM_CS0GCR1 for CSEN is 1. For EIM_CS1GCR1-CS1GCR5 reset value is 0.</p> 0 Chip select function is disabled; attempts to access an address mapped by this chip select results in an error respond and no assertion of the chip select output 1 Chip select is enabled, and is asserted when presented with a valid access. |

22.9.2 Chip Select n General Configuration Register 2 (EIM_CSnGCR2)

Address: 21B_8000h base + 4h offset + (24d × i), where i=0d to 3d

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |

EIM_CSnGCR2 field descriptions

| Field | Description |
|------------------------|--|
| 31–13 Reserved | This read-only field is reserved and always has the value 0. |
| 12 MUX16_BYP_ GRANT | Muxed 16 bypass grant. This bit when asserted causes EIM to bypass the grant/ack. arbitration with NFC (only for 16 bit muxed mode accesses). 0 EIM waits for grant before driving a 16 bit muxed mode access to the memory. 1 EIM ignores the grant signal and immediately drives a 16 bit muxed mode access to the memory. |
| 11–10 Reserved | This read-only field is reserved and always has the value 0. |
| 9 DAP | Data Acknowledge Polarity. This bit indicates DTACK memory pin assertion state, active-low or active-high, while executing an async access using DTACK signal from the external device. DAP is cleared by a hardware reset. 0 DTACK signal is active high 1 DTACK signal is active low |
| 8 DAE | Data Acknowledge Enable. This bit indicates external device is using DTACK pin as strobe/terminator of an async. access. DTACK signal may be used only in asynchronous single read (APR=0) or write accesses. DTACK poling start point is set by DAPS bit field. polarity of DTACK is set by DAP bit field. DAE is cleared by a hardware reset. 0 DTACK signal use is disable 1 DTACK signal use is enable |
| 7–4 DAPS | Data Acknowledge Poling Start. This bit field determine the starting point of DTACK input signal polling. DAPS is used only in asynchronous single read or write accesses. |

Table continues on the next page...

EIM_CS_nGCR2 field descriptions (continued)

| Field | Description |
|-----------------|--|
| | <p>NOTE: Since DTACK is an async. signal the start point of DTACK signal polling is at least 3 cycles after the start of access.</p> <p>DAPS is cleared by a hardware reset.</p> <p>Example settings:</p> <p>0000 3 EIM clk cycle between start of access and first \overline{DTACK} check</p> <p>0001 4 EIM clk cycles between start of access and first \overline{DTACK} check</p> <p>0010 5 EIM clk cycles between start of access and first \overline{DTACK} check</p> <p>0111 10 EIM clk cycles between start of access and first \overline{DTACK} check</p> <p>1011 14 EIM clk cycles between start of access and first DTACK check</p> <p>1111 18 EIM clk cycles between start of access and first DTACK check</p> |
| 3–2 Reserved | This read-only field is reserved and always has the value 0. |
| 1–0 ADH | <p>Address hold time - This bit field determine the address hold time after ADV negation when mum = 1 (muxed mode).</p> <p>When mum = 0 this bit has no effect. For read accesses the field determines when the pads direction will be switched.</p> <p>NOTE: Reset value for EIM_CS0GCR2 for ADH is 10. For EIM_CS1GCR2-EIM_CS5GCR2 reset value is 00.</p> <p>00 0 cycle after ADV negation</p> <p>01 1 cycle after ADV negation</p> <p>10 2 cycle after ADV negation</p> <p>11 Reserved</p> |

22.9.3 Chip Select n Read Configuration Register 1 (EIM_CS_nRCR1)

EIM_CS_nRCR1 field descriptions

| Field | Description |
|-------------------|--|
| 31–30 Reserved | This read-only field is reserved and always has the value 0. |

Table continues on the next page...

EIM_CS*n*RCR1 field descriptions (continued)

| Field | Description |
|----------------|---|
| 29–24 RWSC | <p>Read Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous read access to the external device connected to the chip select.</p> <p>When SRD=1 and RFL=0, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the controller can start sample data. Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode.</p> <p>When SRD=1 and RFL=1, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode.</p> <p>When SRD=0, RFL bit is ignored, RWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer.</p> <p>RWSC is cleared by a hardware reset.</p> <p>NOTE: The reset value for EIM_CS0RCR1, RWSC[5:0] = 0b011100. For CG1RCR1 - CS1RCR5 the reset value is 0b000000.</p> <p>Example settings:</p> <p>000000 Reserved 000001 RWSC value is 1 000010 RWSC value is 2 111101 RWSC value is 61 111110 RWSC value is 62 111111 RWSC value is 63</p> |
| 23 Reserved | This read-only field is reserved and always has the value 0. |
| 22–20 RADVA | <p>ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous read modes according to the settings shown below. RADVA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and ADV assertion 001 1 EIM clock cycles between beginning of access and ADV assertion 010 2 EIM clock cycles between beginning of access and ADV assertion 111 7 EIM clock cycles between beginning of access and ADV assertion</p> |
| 19 RAL | Read ADV Low. This bit field determine ADV signal negation time. When RAL=1, RADVN bit field is ignored and ADV signal will stay asserted until end of access. When RAL=0 negation of ADV signal is according to RADVN bit field configuration. |
| 18–16 RADVN | <p>ADV Negation. This bit field determines when ADV signal to memory is negated during read accesses.</p> <p>When SRD=1 (synchronous read mode), ADV negation occurs according to the following formula: (RADVN + RADVA + BCD + BCS + 1) EIM clock cycles from start of access.</p> <p>When asynchronous read mode is applied (SRD=0) and RAL=0 ADV negation occurs according to the following formula: (RADVN + RADVA + 1) EIM clock cycles from start of access. RADVN is cleared by a hardware reset.</p> <p>NOTE: the reset value for EIM_CS0RCR1[RADVN] = 2. For EIM_CS1RCR1 - EIM_CS5RCR1, the reset value is 0b000.</p> <p>NOTE: This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time with the end of access user should RAL bit.</p> |

Table continues on the next page...

EIM_CS n RCR1 field descriptions (continued)

| Field | Description |
|----------------|---|
| 15 Reserved | This read-only field is reserved and always has the value 0. |
| 14–12 OEA | <p>OE Assertion. This bit field determines when OE signal are asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. OEA is cleared by a hardware reset.</p> <p>In muxed mode OE assertion occurs (OEA + RADVN + RADVA + ADH +1) EIM clock cycles from start of access.</p> <p>NOTE: The reset value for EIM_CS0RCR1[OEA] is 0b000 if EIM_BOOT[2] = 0. If EIM_BOOT[2] is 1, the reset value for EIM_CS0RCR1 is 0b010. The reset value of this field for EIM_CS1RCR1 - EIM_CS5RCR1 is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and OE assertion 001 1 EIM clock cycles between beginning of access and OE assertion 010 2 EIM clock cycles between beginning of access and OE assertion 111 7 EIM clock cycles between beginning of access and OE assertion</p> |
| 11 Reserved | This read-only field is reserved and always has the value 0. |
| 10–8 OEN | <p>OE Negation. This bit field determines when OE signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. OEN is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of access and OE negation 001 1 EIM clock cycles between end of access and OE negation 010 2 EIM clock cycles between end of access and OE negation 111 7 EIM clock cycles between end of access and OE negation</p> |
| 7 Reserved | This read-only field is reserved and always has the value 0. |
| 6–4 RCSA | <p>Read CS Assertion. This bit field determines when CS signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RCSA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of read access and CS assertion 001 1 EIM clock cycles between beginning of read access and CS assertion 010 2 EIM clock cycles between beginning of read access and CS assertion 111 7 EIM clock cycles between beginning of read access and CS assertion</p> |
| 3 Reserved | This read-only field is reserved and always has the value 0. |
| 2–0 RCSN | <p>Read CS Negation. This bit field determines when CS signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. RCSN is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of read access and CS negation 001 1 EIM clock cycles between end of read access and CS negation 010 2 EIM clock cycles between end of read access and CS negation 111 7 EIM clock cycles between end of read access and CS negation</p> |

EIM_CSnRCR2 field descriptions

| Field | Description |
|-------------------|--|
| 31–16 Reserved | This read-only field is reserved and always has the value 0. |
| 15 APR | Asynchronous Page Read. This bit field determine the asynchronous read mode to the external device. When APR=0, the async. read access is done as single word (where word is defined by the DSZ field). when APR=1, the async. read access executed as page read. page size is according to BL field config., RCSN,RBEN,OEN and RADVN are being ignored. APR is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1. NOTE: SRD=0 and MUM=0 must apply when APR=1 |
| 14–12 PAT | Page Access Time. This bit field is used in Asynchronous Page Read mode only (APR=1). the initial access is set by RWSC as in regular asynchronous mode. the consecutive address assertions width determine by PAT field according to the settings shown below. when APR=0 this field is ignored. PAT is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1. 000 Address width is 2 EIM clock cycles 001 Address width is 3 EIM clock cycles 010 Address width is 4 EIM clock cycles 011 Address width is 5 EIM clock cycles 100 Address width is 6 EIM clock cycles 101 Address width is 7 EIM clock cycles 110 Address width is 8 EIM clock cycles 111 Address width is 9 EIM clock cycles |
| 11–10 Reserved | This read-only field is reserved and always has the value 0. |
| 9–8 RL | Read Latency. This bit field indicates cycle latency when executing a synchronous read operation. The fields holds the feedback clock loop delay in aclk cycle units. This field is cleared by a hardware reset. 00 Feedback clock loop delay is up to 1 cycle for BCD = 0 or 1.5 cycles for BCD != 0 01 Feedback clock loop delay is up to 2 cycles for BCD = 0 or 2.5 cycles for BCD != 0 |

Table continues on the next page...

EIM_CS_nRCR2 field descriptions (continued)

| Field | Description |
|---------------|---|
| 10 | Feedback clock loop delay is up to 3 cycles for BCD = 0 or 3.5 cycles for BCD != 0 |
| 11 | Feedback clock loop delay is up to 4 cycles for BCD = 0 or 4.5 cycles for BCD != 0 |
| 7 Reserved | This read-only field is reserved and always has the value 0. |
| 6–4 RBEA | Read BE Assertion. This bit field determines when BE signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RBEA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of read access and BE assertion 001 1 EIM clock cycles between beginning of read access and BE assertion 010 2 EIM clock cycles between beginning of read access and BE assertion 111 7 EIM clock cycles between beginning of read access and BE assertion |
| 3 RBE | Read BE enable. This bit field determines if BE will be asserted during read access. 0 - BE are disabled during read access. 1- BE are enable during read access according to value of RBEA & RBEN bit fields. |
| 2–0 RBEN | Read BE Negation. This bit field determines when BE signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR=0), according to the settings shown below. This bit field is ignored when SRD=1. RBEN is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between end of read access and BE negation 001 1 EIM clock cycles between end of read access and BE negation 010 2 EIM clock cycles between end of read access and BE negation 111 7 EIM clock cycles between end of read access and BE negation |

22.9.5 Chip Select n Write Configuration Register 1 (EIM_CS_nWCR1)

Address: 21B_8000h base + 10h offset + (24d × i), where i=0d to 3d

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | | | | | | | | | | | | | | | | |

EIM_CS_nWCR1 field descriptions

| Field | Description |
|----------------|---|
| 31 WAL | Write ADV Low. This bit field determine ADV signal negation time in write accesses. When WAL=1, WADVN bit field is ignored and ADV signal will stay asserted until end of access. When WAL=0 negation of ADV signal is according to WADVN bit field configuration. |
| 30 WBED | Write Byte Enable Disable. When asserted this bit prevent from IPP_DO_BE_B[x] to be asserted during write accesses. This bit is cleared by hardware reset. |
| 29–24 WWSC | <p>Write Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous write access to the external device connected to the chip select.</p> <p>When SWR=1 and WFL=0, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the memory can sample the first data. Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode.</p> <p>When SWR=1 and WFL=1, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode.</p> <p>When SWR=0, WFL bit is ignored, WWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer.</p> <p>WWSC is cleared by a hardware reset.</p> <p>NOTE: The reset value for EIM_CS0WCR1, WWSC[5:0] = 0b011100. For EIM_CS1WCR1 - EIM_CS5WCR1, the reset value of this field is 0b000000.</p> <p>Example settings:</p> <p>000000 Reserved 000001 WWSC value is 1 000010 WWSC value is 2 000011 WWSC value is 3 111111 WWSC value is 63</p> |
| 23–21 WADVA | <p>ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous write modes according to the settings shown below. WADVA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and ADV assertion 001 1 EIM clock cycles between beginning of access and ADV assertion 010 2 EIM clock cycles between beginning of access and ADV assertion 111 7 EIM clock cycles between beginning of access and ADV assertion</p> |
| 20–18 WADVN | <p>ADV Negation. This bit field determines when ADV signal to memory is negated during write accesses.</p> <p>When SWR=1 (synchronous write mode), ADV negation occurs according to the following formula: (WADVN + WADVA + BCD + BCS + 1) EIM clock cycles.</p> <p>When asynchronous read mode is applied (SWR=0) ADV negation occurs according to the following formula: (WADVN + WADVA + 1) EIM clock cycles.</p> <p>NOTE: Reset value for EIM_CS0WCR for WADVN is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>NOTE: This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time as the end of access, S/W should set the WAL bit.</p> |
| 17–15 WBEA | BE Assertion. This bit field determines when BE signal is asserted during write cycles in async. mode only (SWR=0), according to the settings shown below. BEA is cleared by a hardware reset. |

Table continues on the next page...

EIM_CS_nWCR1 field descriptions (continued)

| Field | Description |
|---------------|---|
| | <p>NOTE: Reset value for EIM_CS0WCR for WBEA is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and BE assertion</p> <p>001 1 EIM clock cycles between beginning of access and BE assertion</p> <p>010 2 EIM clock cycles between beginning of access and BE assertion</p> <p>111 7 EIM clock cycles between beginning of access and BE assertion</p> |
| 14–12 WBEN | <p>BE[3:0] Negation. This bit field determines when BE[3:0] bus signal is negated during write cycles in async. mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. BEN is cleared by a hardware reset.</p> <p>NOTE: Reset value for EIM_CS0WCR for WBEN is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of access and WE negation</p> <p>001 1 EIM clock cycles between end of access and WE negation</p> <p>010 2 EIM clock cycles between end of access and WE negation</p> <p>111 7 EIM clock cycles between end of access and WE negation</p> |
| 11–9 WEA | <p>WE Assertion. This bit field determines when WE signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below. This bit field is ignored when executing a read access to the external device. WEA is cleared by a hardware reset.</p> <p>NOTE: Reset value for EIM_CS0WCR for WEA is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and WE assertion</p> <p>001 1 EIM clock cycles between beginning of access and WE assertion</p> <p>010 2 EIM clock cycles between beginning of access and WE assertion</p> <p>111 7 EIM clock cycles between beginning of access and WE assertion</p> |
| 8–6 WEN | <p>WE Negation. This bit field determines when WE signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. WEN is cleared by a hardware reset.</p> <p>NOTE: Reset value for EIM_CS0WCR for WEN is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and WE assertion</p> <p>001 1 EIM clock cycles between beginning of access and WE assertion</p> <p>010 2 EIM clock cycles between beginning of access and WE assertion</p> <p>111 7 EIM clock cycles between beginning of access and WE assertion</p> |
| 5–3 WCSA | <p>Write CS Assertion. This bit field determines when CS signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below. This bit field is ignored when executing a read access to the external device. WCSA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of write access and CS assertion</p> |

Table continues on the next page...

EIM_CS_nWCR2 field descriptions

| Field | Description |
|------------------|---|
| 31–1 Reserved | This read-only field is reserved and always has the value 0. |
| 0 WBCDD | Write Burst Clock Divisor Decrement. If this bit is asserted and BCD value is 0 sync. write access will be preformed as if BCD value is 1. When this bit is negated or BCD value is not 0 this bit has no affect. This bit is cleared by hardware reset. |

22.9.7 EIM Configuration Register (EIM_WCR)

Address: 21B_8000h base + 90h offset = 21B_8090h

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|--------------|---|-----------|---|---|--------|-------|---|-------|---|------|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | 0 | | | | | WD OG_ LIMIT | | WD OG_ EN | 0 | | INTPOL | INTEN | 0 | GB CD | | BC M |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |

EIM_WCR field descriptions

| Field | Description |
|----------------------|--|
| 31–11 Reserved | This read-only field is reserved and always has the value 0. |
| 10–9 WD OG_ LIMIT | Memory Watch Dog (WDog) cycle limit. This bit field determines the number of BCLK cycles (ACLK cycles in dtack mode) before the wdog counter terminates the access and send an error response to the master. 00 128 BCLK cycles 01 256 BCLK cycles 10 512 BCLK cycles 11 1024 BCLK cycles |
| 8 WD OG_ EN | Memory WDog enable. This bit controls the operation of the wdog counter that terminates the EIM access. 0 Memory WDog is Disabled 1 Memory WDog is Enabled |
| 7–6 Reserved | This read-only field is reserved and always has the value 0. |
| 5 INTPOL | Interrupt Polarity. This bit field determines the polarity of the external device interrupt. 0 External interrupt polarity is active low 1 External interrupt polarity is active high |
| 4 INTEN | Interrupt Enable. When this bit is set the External signal RDY_INT as active interrupt. When interrupt occurs, INT bit at the WCR will be set and t EIM_EXT_INT signal will be asserted correspondingly. This bit is cleared by a hardware reset. 0 External interrupt Disable 1 External interrupt Enable |

Table continues on the next page...

EIM_WCR field descriptions (continued)

| Field | Description |
|---------------|--|
| 3 Reserved | This read-only field is reserved and always has the value 0. |
| 2–1 GBCD | General Burst Clock Divisor. When BCM bit is set, this bit field contains the value used to program the burst clock divisor for Continuous BCLK generation. The other BCD bit fields for each chip select are ignored. It is used to divide the internal AXI bus frequency. When BCM=0 GB CD bit field has no influence. GB CD is cleared by a hardware reset. 00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4 |
| 0 BCM | Burst Clock Mode. This bit selects the burst clock mode of operation. It is used for system debug mode. BCM is cleared by a hardware reset. NOTE: The BCLK frequency in this mode is according to GB CD bit field. NOTE: The BCLK phase is opposite to the EIM clock in this mode if GB CD is 0. NOTE: This bit should be used only in async. accesses. No sync access can be executed if this bit is set. NOTE: When this bit is set bcd field shouldn't be configured to 0. 0 The burst clock runs only when accessing a chip select range with the SWR/SRD bits set. When the burst clock is not running it remains in a logic 0 state. When the burst clock is running it is configured by the BCD and BCS bit fields in the chip select Configuration Register. 1 The burst clock runs whenever ACLK is active (independent of chip select configuration) |

22.9.8 EIM IP Access Register (EIM_WIAR)

Address: 21B_8000h base + 94h offset = 21B_8094h

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | 0 | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |

EIM_WIAR field descriptions

| Field | Description |
|------------------|---|
| 31–5 Reserved | This read-only field is reserved and always has the value 0. |
| 4 ACLK_EN | <p>ACLK enable. This bit gates the ACLK for the EIM except from FFs that get ipg_aclk_s. After reset ACLK is enabled.</p> <p>0 ACLK is disabled 1 ACLK is enabled</p> |
| 3 ERRST | <p>READY After Reset. This bit controls the initial ready/busy status for external devices on CS0 immediately after hardware reset. This is a sticky bit which is cleared once the RDY_INT signal is asserted by the external device.</p> <p>When ERRST = 1 the first fetch access from EIM to the external device located on CS0 will be pending until RDY_INT signal indicates that the external device is ready, then EIM will execute the access.</p> <p>0 RDY_INT After Reset Disable 1 RDY_INT After Reset Enable</p> |
| 2 INT | Interrupt. This bit indicates interrupt assertion by an external device according to RDY_INT signal. When polling this bit, INT=0 indicates interrupt not occurred and INT=1 indicates assertion of the external device interrupt. This bit is cleared by a hardware reset. |
| 1 IPS_ACK | <p>IPS ACK. The EIM is ready for ips access. There is no active AXI access and no new AXI access is accepted till this bit is cleared. This bit is cleared by the master after it completes the ips accesses.</p> <p>0 Master cannot access ips. 1 Master can access ips.</p> |
| 0 IPS_REQ | <p>IPS request. The Master requests to access one of the IPS registers. During such access the EIM should not perform any AXI/memory accesses. The EIM finishes the AXI accesses that already starts and asserts the IPS_ACK bit.</p> <p>0 No Master requests ips access 1 Master requests ips access</p> |

22.9.9 Error Address Register (EIM_EAR)

Address: 21B_8000h base + 98h offset = 21B_8098h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| R | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

EIM_EAR field descriptions

| Field | Description |
|--------------------|--|
| 31–0 Error_ADDR | Error Address. This bit field holds the AXI address of the last access that caused error. This register is read only register. |

Chapter 23

10/100/1000-Mbps Ethernet MAC (ENET)

23.1 Overview

The core implements a triple speed 10/100/1000 Mbit/s Ethernet MAC compliant with the IEEE802.3-2002 standard. The MAC layer provides compatibility with half- or full-duplex 10/100 Mbit/s Ethernet LANs and full-duplex gigabit Ethernet LANs.

The MAC operation is fully programmable and can be used in Network Interface Card (NIC), bridging, or switching applications. The core implements the remote network monitoring (RMON) counters according to IETF RFC 2819.

The core also implements a hardware acceleration block to optimize the performance of network controllers providing TCP/IP, UDP, and ICMP protocol services. The acceleration block performs critical functions in hardware, which are typically implemented with large software overhead.

The core implements programmable embedded FIFOs that can provide buffering on the receive path for lossless flow control.

Advanced power management features are available with magic packet detection and programmable power-down modes.

The programmable 10/100/1000 Ethernet MAC with IEEE 1588 integrates a standard IEEE 802.3 Ethernet MAC with a time-stamping module. The IEEE 1588 standard provides accurate clock synchronization for distributed control nodes for industrial automation applications.

23.1.1 Features

The MAC-NET core includes the following features.

23.1.1.1 Ethernet MAC features

- Implements the full 802.3 specification with preamble/SFD generation, frame padding generation, CRC generation and checking
- Supports zero length Preamble
- Dynamically configurable to support 10/100 Mbit/s and Gigabit operation
- Supports 10/100 Mbit/s full-duplex and configurable half-duplex operation
- Supports gigabit full-duplex operation
- Compliant with the AMD magic packet detection with interrupt for node remote power management
- Seamless interface to commercial ethernet PHY devices via:
 - a 4-bit Medium Independent Interface (MII) operating at 25 MHz, or
 - a 2-bit Reduced MII (RMII) operating at 50 MHz, or
 - a (double data rate) 4-bit Reduced GMII (RGMII) operating at 125 MHz.
- Simple 64-Bit FIFO user-application interface
- CRC-32 checking at full speed with optional forwarding of the frame check sequence (FCS) field to the client
- CRC-32 generation and append on transmit or forwarding of user application provided FCS selectable on a per-frame basis
- In full-duplex mode:
 - Implements automated pause frame (802.3 x31A) generation and termination, providing flow control without user application intervention
 - Pause quanta used to form pause frames — dynamically programmable
 - Pause frame generation additionally controllable by user application offering flexible traffic flow control
 - Optional forwarding of received pause frames to the user application
 - Implements standard flow-control mechanism
- In half-duplex mode: provides full collision support, including jamming, backoff, and automatic retransmission
- Supports VLAN-tagged frames according to IEEE 802.1Q
- Programmable MAC address: Insertion on transmit; discards frames with mismatching destination address on receive (except broadcast and pause frames)
- Programmable promiscuous mode support to omit MAC destination address checking on receive
- Multicast and unicast address filtering on receive based on 64-entry hash table, reducing higher layer processing load
- Programmable frame maximum length providing support for any standard or proprietary frame length
- Statistics indicators for frame traffic and errors (alignment, CRC, length) and pause frames providing for IEEE 802.3 basic and mandatory management information database (MIB) package and remote network monitoring (RFC 2819)

- Simple handshake user application FIFO interface with fully programmable depth and threshold levels
- Provides separate status word for each received frame on the user interface providing information such as frame length, frame type, VLAN tag, and error information
- Multiple internal loopback options
- MDIO master interface for PHY device configuration and management with two programmable MDIO base addresses
- Supports legacy FEC buffer descriptors
- Important Note: The theoretical maximum performance of 1 Gbps ENET is limited to 470 Mbps (total for Tx and Rx) due to Chip internal bus throughput limitation. The actual measured performance in an optimized environment is up to 400 Mbps. See erratum ERR004512 in the device silicon errata document.

23.1.1.2 IP protocol performance optimization features

- Operates on TCP/IP and UDP/IP and ICMP/IP protocol data or IP header only
- Enables wire-speed processing
- Supports IPv4 and IPv6
- Transparent passing of frames of other types and protocols
- Supports VLAN tagged frames according to IEEE 802.1q with transparent forwarding of VLAN tag and control field
- Automatic IP-header and payload (protocol specific) checksum calculation and verification on receive
- Automatic IP-header and payload (protocol specific) checksum generation and automatic insertion on transmit configurable on a per-frame basis
- Supports IP and TCP, UDP, ICMP data for checksum generation and checking
- Supports full header options for IPv4 and TCP protocol headers
- Provides IPv6 support to datagrams with base header only — datagrams with extension headers are passed transparently unmodified/unchecked
- Provides statistics information for received IP and protocol errors
- Configurable automatic discard of erroneous frames
- Configurable automatic host-to-network (RX) and network-to-host (TX) byte order conversion for IP and TCP/UDP/ICMP headers within the frame
- Configurable padding remove for short IP datagrams on receive

- Configurable Ethernet payload alignment to allow for 32-bit word-aligned header and payload processing
- Programmable store-and-forward operation with clock and rate decoupling FIFOs

23.1.1.3 IEEE 1588 features

- Supports all IEEE 1588 frames
- Allows reference clock to be chosen independently of network speed
- Software-programmable precise time-stamping of ingress and egress frames
- Timer monitoring capabilities for system calibration and timing accuracy management
- Precise time-stamping of external events with programmable interrupt generation
- Programmable event and interrupt generation for external system control
- Supports hardware- and software-controllable timer synchronization
- Provides a 4-channel IEEE 1588 timer — each channel supports input capture and output compare using the 1588 counter

23.1.2 Block diagram

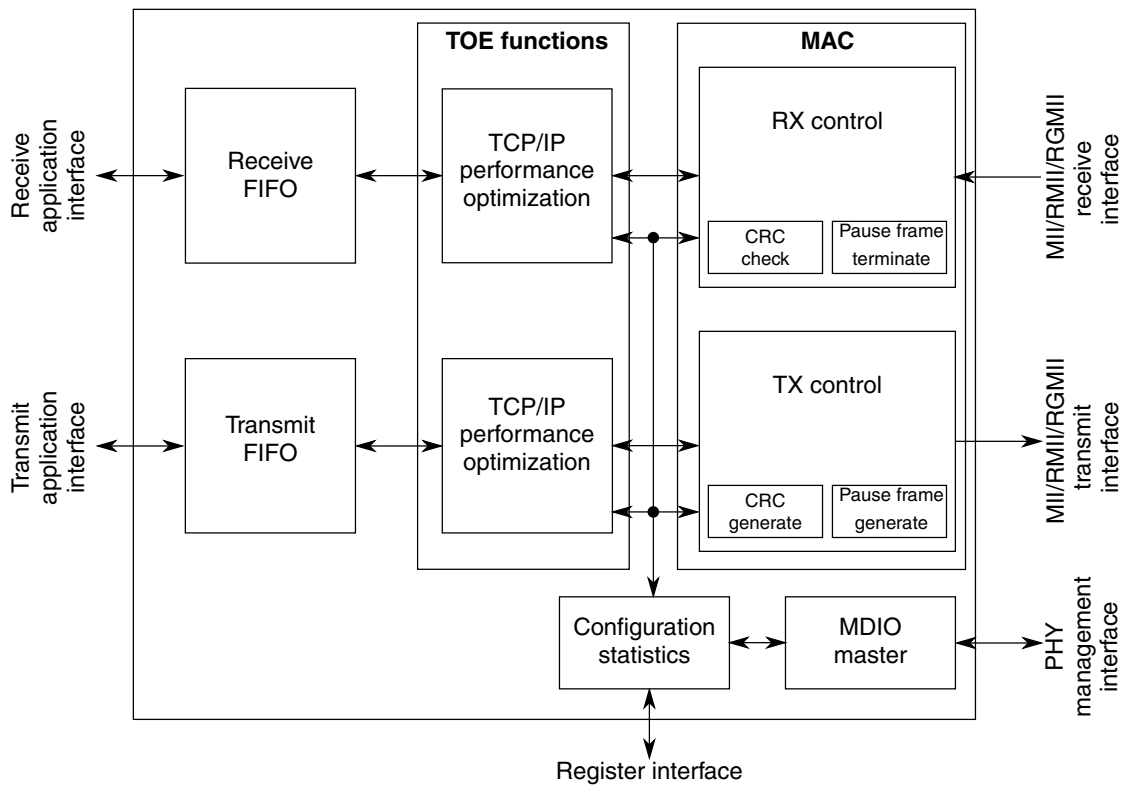

Figure 23-1. 10/100/1000 Ethernet MAC-NET core block diagram

23.2 External Signals

The table found here describes the external signals of ENET.

Table 23-1. ENET External Signals

| Signal | Description | Mode | Pad | Alt Mode | Direction |
|---------------------|---|----------------|-----------|----------|-----------|
| ENET_1588_EVENT0_IN | Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set. | MII/RMII/RGMII | ENET_TXD1 | ALT4 | I |

Table continues on the next page...

Table 23-1. ENET External Signals (continued)

| Signal | Description | Mode | Pad | Alt Mode | Direction |
|----------------------|---|----------------|-----------|----------|-----------|
| ENET_1588_EVENT0_OUT | Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRN register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRN. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set. | MII/RMII/RGMII | GPIO_19 | ALT1 | O |
| ENET_1588_EVENT1_IN | Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRN register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRN. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set. | MII/RMII/RGMII | ENET_MDC | ALT4 | I |
| ENET_1588_EVENT1_OUT | Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRN register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRN. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set. | MII/RMII/RGMII | ENET_MDIO | ALT4 | O |

Table continues on the next page...

Table 23-1. ENET External Signals (continued)

| Signal | Description | Mode | Pad | Alt Mode | Direction |
|----------------------|---|----------------|------------|----------|-----------|
| ENET_1588_EVENT2_IN | Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRN register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRN. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set. | MII/RMII/RGMII | GPIO_16 | ALT1 | I |
| ENET_1588_EVENT2_OUT | Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRN register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRN. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set. | MII/RMII/RGMII | ENET_RX_ER | ALT4 | O |
| ENET_1588_EVENT3_IN | Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRN register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRN. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set. | MII/RMII/RGMII | GPIO_17 | ALT1 | I |

Table 23-1. ENET External Signals (continued)

| Signal | Description | Mode | Pad | Alt Mode | Direction |
|----------------------|--|----------------|--------------|----------|-----------|
| ENET_1588_EVENT3_OUT | <p>Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRN register for inspection by software.</p> <p>When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRN.</p> <p>An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.</p> | MII/RMII/RGMII | ENET_RXD1 | ALT4 | O |
| ENET_COL | Asserted upon detection of a collision and remains asserted while the collision persists. This signal is not defined for full duplex mode. | MII | KEY_ROW1 | ALT1 | I |
| ENET_CRS | <p>Carrier sense. When asserted, indicates transmit or receive medium is not idle.</p> <p>In RMII mode, this signal is present on the RMII_CRS_DV pin.</p> | MII | KEY_COL3 | ALT1 | I |
| ENET_MDC | Output clock provides a timing reference to the PHY for data transfers on the MDIO signal. | MII/RMII/RGMII | ENET_MDC | ALT1 | O |
| | | | KEY_COL2 | ALT4 | |
| ENET_MDIO | Transfers control information between the external PHY and the media-access controller. Data is synchronous to MDC. This signal is an input after reset. | MII/RMII/RGMII | ENET_MDIO | ALT1 | IO |
| | | | KEY_COL1 | ALT1 | |
| ENET_REF_CLK | In RMII mode, this signal is the reference clock for receive, transmit, and the control interface. | RMII | GPIO_16 | ALT2 | I |
| | | | RGMII_TX_CTL | ALT7 | |
| ENET_RX_CLK | In MII mode, provides a timing reference for RX_EN, RX_DATA[3:0], and RX_ER. In RGMII mode, provides a timing reference for RX_DATA[3:0] and RX_CTL. | MII | GPIO_18 | ALT1 | I |
| ENET_RX_DATA0 | Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted. | MII/RMII | ENET_RXD0 | ALT1 | I |
| ENET_RX_DATA1 | Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted. | MII/RMII | ENET_RXD1 | ALT1 | I |

Table continues on the next page...

Table 23-1. ENET External Signals (continued)

| Signal | Description | Mode | Pad | Alt Mode | Direction |
|---------------|--|----------|--------------|----------|-----------|
| ENET_RX_DATA2 | Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted. | MII | KEY_COL2 | ALT1 | I |
| ENET_RX_DATA3 | Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted. | MII | KEY_COL0 | ALT1 | I |
| ENET_RX_EN | Asserting this input indicates the PHY has valid nibbles present on the MII. RX_EN must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RX_EN must start no later than the SFD and exclude any EOF. In RMII mode, this pin also generates the CRS signal. In RGMII mode, contains RXDV on the rising edge of RX_CLK, and a logical derivative of RX_EV and RX_ER (RX_EV XOR RX_ER) on the falling edge of RX_CLK. | MII/RMII | ENET_CRS_DV | ALT1 | I |
| ENET_RX_ER | When asserted with RXDV, indicates the PHY detects an error in the current frame. | MII/RMII | ENET_RX_ER | ALT1 | I |
| ENET_TX_CLK | Input clock, which provides a timing reference for TX_EN, TX_DATA[3:0], and TX_ER. | MII | ENET_REF_CLK | ALT1 | I |
| ENET_TX_DATA0 | Serial output Ethernet data. Only valid during TX_EN assertion. | MII/RMII | ENET_TXD0 | ALT1 | O |
| ENET_TX_DATA1 | Serial output Ethernet data. Only valid during TX_EN assertion. | MII/RMII | ENET_TXD1 | ALT1 | O |
| ENET_TX_DATA2 | Serial output Ethernet data. Only valid during TX_EN assertion. | MII | KEY_ROW2 | ALT1 | O |
| ENET_TX_DATA3 | Serial output Ethernet data. Only valid during TX_EN assertion. | MII | KEY_ROW0 | ALT1 | O |
| ENET_TX_EN | Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame. In RGMII mode, contains TX_EN on the rising edge of TX_CTL, and a logical derivative of TX_EN and TX_ER (TX_EN XOR TX_ER) on the falling edge of TX_CTL. | MII/RMII | ENET_TX_EN | ALT1 | O |
| ENET_TX_ER | When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols. | MII/RMII | GPIO_19 | ALT6 | O |

Table continues on the next page...

Table 23-1. ENET External Signals (continued)

| Signal | Description | Mode | Pad | Alt Mode | Direction |
|--------------|---|-------|--------------|----------|-----------|
| RGMII_RD0 | Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted. | RGMII | RGMII_RD0 | ALT1 | I |
| RGMII_RD1 | Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted. | RGMII | RGMII_RD1 | ALT1 | I |
| RGMII_RD2 | Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted. | RGMII | RGMII_RD2 | ALT1 | I |
| RGMII_RD3 | Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted. | RGMII | RGMII_RD3 | ALT1 | I |
| RGMII_RXC | In MII mode, provides a timing reference for RX_EN, RX_DATA[3:0], and RX_ER. In RGMII mode, provides a timing reference for RX_DATA[3:0] and RX_CTL. | RGMII | RGMII_RXC | ALT1 | I |
| RGMII_RX_CTL | Asserting this input indicates the PHY has valid nibbles present on the MII. RX_EN must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RX_EN must start no later than the SFD and exclude any EOF. In RMII mode, this pin also generates the CRS signal. In RGMII mode, contains RX_EN on the rising edge of RGMII_RXC, and a logical derivative of RX_EN and RX_ER (RX_EN XOR RX_ER) on the falling edge of RGMII_RXC. | RGMII | RGMII_RX_CTL | ALT1 | I |
| RGMII_TD0 | Serial output Ethernet data. Only valid during TX_EN assertion. | RGMII | RGMII_TD0 | ALT1 | O |
| RGMII_TD1 | Serial output Ethernet data. Only valid during TX_EN assertion. | RGMII | RGMII_TD1 | ALT1 | O |
| RGMII_TD2 | Serial output Ethernet data. Only valid during TX_EN assertion. | RGMII | RGMII_TD2 | ALT1 | O |
| RGMII_TD3 | Serial output Ethernet data. Only valid during TX_EN assertion. | RGMII | RGMII_TD3 | ALT1 | O |
| RGMII_TXC | Serial output Ethernet data. Only valid during TX_EN assertion. | RGMII | RGMII_TXC | ALT1 | O |

Table continues on the next page...

Table 23-1. ENET External Signals (continued)

| Signal | Description | Mode | Pad | Alt Mode | Direction |
|--------------|--|-------|--------------|----------|-----------|
| RGMII_TX_CTL | <p>Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame.</p> <p>In RGMII mode, contains TX_EN on the rising edge of RGMII_TXC, and a logical derivative of TX_EN and TX_ER (TX_EN XOR TX_ER) on the falling edge of RGMII_TXC.</p> | RGMII | RGMII_TX_CTL | ALT1 | O |

23.3 Clocks

>The table found here describes the clock sources for ENET.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 23-2. ENET Clocks

| Clock name | Clock Root | Description |
|----------------|--------------|-----------------------------|
| ipg_clk | ahb_clk_root | Module clock |
| ipg_clk_mac0 | ahb_clk_root | MAC peripheral clock |
| ipg_clk_mac0_s | ipg_clk_root | MAC peripheral access clock |
| ipg_clk_s | ipg_clk_root | Peripheral access clock |
| ipg_clk_time | ipg_clk_root | Peripheral clock |
| mac0_rxmem_clk | ahb_clk_root | MAC receive memory clock |
| mac0_txmem_clk | ahb_clk_root | MAC transmit memory clock |

23.4 Memory map/register definition

Reserved bits should be written with 0 and ignored on read to allow future extension. Unused registers read zero and a write has no effect.

The table found here summarizes the Ethernet registers.

Table 23-3. Register map summary

| Offset Address | Section | Description |
|----------------|-----------------------|--|
| 0x000 | Configuration | Core control and status registers |
| 0x200 | Statistics counters | MIB block counters. See Statistic event counters . |
| 0x400 | 1588 control | 1588 adjustable timer (TSM) and 1588 frame control |
| 0x600 | Capture/compare block | Registers for the capture/compare block |

ENET memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/page |
|------------------------|--|-----------------|--------|-------------|------------------------------|
| 218_8004 | Interrupt Event Register (ENET_EIR) | 32 | w1c | 0000_0000h | 23.4.1/1084 |
| 218_8008 | Interrupt Mask Register (ENET_EIMR) | 32 | R/W | 0000_0000h | 23.4.2/1087 |
| 218_8010 | Receive Descriptor Active Register (ENET_RDAR) | 32 | R/W | 0000_0000h | 23.4.3/1090 |

23.4.1 Interrupt Event Register (ENET_EIR)

When an event occurs that sets a bit in EIR, an interrupt occurs if the corresponding bit in the interrupt mask register (EIMR) is also set. Writing a 1 to an EIR bit clears it; writing 0 has no effect. This register is cleared upon hardware reset.

NOTE

TxBD[INT] and RxBD[INT] must be set to 1 to allow setting the corresponding EIR register flags in enhanced mode, ENET_ECR[EN1588] = 1. Legacy mode does not require these flags to be enabled.

Address: 218_8000h base + 4h offset = 218_8004h

ENET_EIR field descriptions

| Field | Description |
|----------------|---|
| 31 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 30 BABR | Babbling Receive Error Indicates a frame was received with length in excess of RCR[MAX_FL] bytes. |
| 29 BABT | Babbling Transmit Error Indicates the transmitted frame length exceeds RCR[MAX_FL] bytes. Usually this condition is caused when a frame that is too long is placed into the transmit data buffer(s). Truncation does not occur. |
| 28 GRA | Graceful Stop Complete This interrupt is asserted after the transmitter is put into a pause state after completion of the frame currently being transmitted. See Graceful Transmit Stop (GTS) for conditions that lead to graceful stop. NOTE: The GRA interrupt is asserted only when the TX transitions into the stopped state. If this bit is cleared by writing 1 and the TX is still stopped, the bit is not set again. |
| 27 TXF | Transmit Frame Interrupt Indicates a frame has been transmitted and the last corresponding buffer descriptor has been updated. |
| 26 TXB | Transmit Buffer Interrupt Indicates a transmit buffer descriptor has been updated. |
| 25 RXF | Receive Frame Interrupt Indicates a frame has been received and the last corresponding buffer descriptor has been updated. |
| 24 RXB | Receive Buffer Interrupt Indicates a receive buffer descriptor is not the last in the frame has been updated. |
| 23 MII | MII Interrupt. Indicates that the MII has completed the data transfer requested. |
| 22 EBERR | Ethernet Bus Error Indicates a system bus error occurred when a uDMA transaction is underway. When this bit is set, ECR[ETHEREN] is cleared, halting frame processing by the MAC. When this occurs, software must ensure proper actions, possibly resetting the system, to resume normal operation. |
| 21 LC | Late Collision |

Table continues on the next page...

ENET_EIR field descriptions (continued)

| Field | Description |
|-------------------|---|
| | Indicates a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame truncates with a bad CRC and the remainder of the frame is discarded. |
| 20 RL | Collision Retry Limit Indicates a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. This error can only occur in half-duplex mode. |
| 19 UN | Transmit FIFO Underrun Indicates the transmit FIFO became empty before the complete frame was transmitted. A bad CRC is appended to the frame fragment and the remainder of the frame is discarded. |
| 18 PLR | Payload Receive Error Indicates a frame was received with a payload length error. See Frame Length/Type Verification: Payload Length Check for more information. |
| 17 WAKEUP | Node Wakeup Request Indication Read-only status bit to indicate that a magic packet has been detected. Will act only if ECR[MAGICEN] is set. |
| 16 TS_AVAIL | Transmit Timestamp Available Indicates that the timestamp of the last transmitted timing frame is available in the ATSTMP register. |
| 15 TS_TIMER | Timestamp Timer The adjustable timer reached the period event. A period event interrupt can be generated if ATCR[PEREN] is set and the timer wraps according to the periodic setting in the ATPER register. Set the timer period value before setting ATCR[PEREN]. |
| 14–13 Reserved | This field is reserved. |
| 12 Reserved | This field is reserved. |
| 11–0 Reserved | This field is reserved. |

23.4.2 Interrupt Mask Register (ENET_EIMR)

EIMR controls which interrupt events are allowed to generate actual interrupts. A hardware reset clears this register. If the corresponding bits in the EIR and EIMR registers are set, an interrupt is generated. The interrupt signal remains asserted until a 1 is written to the EIR field (write 1 to clear) or a 0 is written to the EIMR field.

Address: 218_8000h base + 8h offset = 218_8008h

23.4.3 Receive Descriptor Active Register (ENET_RDAR)

RDAR is a command register, written by the user, to indicate that the receive descriptor ring has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: 218_8000h base + 10h offset = 218_8010h

ENET_RDAR field descriptions

| Field | Description |
|-------------------|---|
| 31–25 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 24 RDAR | Receive Descriptor Active Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set. |
| 23–0 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |

23.4.4 Transmit Descriptor Active Register (ENET_TDAR)

The TDAR is a command register that the user writes to indicate that the transmit descriptor ring has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Address: 218_8000h base + 14h offset = 218_8014h

ENET_TDAR field descriptions

| Field | Description |
|-------------------|---|
| 31–25 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 24 TDAR | Transmit Descriptor Active Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set. |
| 23–0 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |

23.4.5 Ethernet Control Register (ENET_ECR)

ECR is a read/write user register, though hardware may also alter fields in this register. It controls many of the high level features of the Ethernet MAC, including legacy FEC support through the EN1588 field.

Address: 218_8000h base + 24h offset = 218_8024h

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|-------|--------|-------|-------|--------|-------|---------|---------|-------|

| 2 MAGICEN | <p>Magic Packet Detection Enable</p> <p>Enables/disables magic packet detection.</p> <p>NOTE: MAGICEN is relevant only if the SLEEP field is set. If MAGICEN is set, changing the SLEEP field enables/disables sleep mode and magic packet detection.</p> <p>0 Magic detection logic disabled. 1 The MAC core detects magic packets and asserts EIR[WAKEUP] when a frame is detected.</p> |
| 1 ETHEREN | <p>Ethernet Enable</p> <p>Enables/disables the Ethernet MAC. When the MAC is disabled, the buffer descriptors for an aborted transmit frame are not updated. The uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.</p> <p>Hardware clears this field under the following conditions:</p> <ul style="list-style-type: none"> • RESET is set by software • An error condition causes the EBERR field to set. <p>NOTE: ETHEREN must be set at the very last step during ENET configuration/setup/initialization, only <i>after</i> all other ENET-related registers have been configured.</p> <p>0 Reception immediately stops and transmission stops after a bad CRC is appended to any currently transmitted frame. 1 MAC is enabled, and reception and transmission are possible.</p> |
| 0 RESET | <p>Ethernet MAC Reset</p> <p>When this field is set, it clears the ETHEREN field.</p> |

23.4.6 MII Management Frame Register (ENET_MMFR)

Writing to MMFR triggers a management frame transaction to the PHY device unless MSCR is programmed to zero.

If MSCR is changed from zero to non-zero during a write to MMFR, an MII frame is generated with the data previously written to the MMFR. This allows MMFR and MSCR to be programmed in either order if MSCR is currently zero.

If the MMFR register is written while frame generation is in progress, the frame contents are altered. Software must use the EIR[MII] interrupt indication to avoid writing to the MMFR register while frame generation is in progress.

Address: 218_8000h base + 40h offset = 218_8040h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ENET_MMFR field descriptions

| Field | Description |
|--------------|---|
| 31–30 ST | Start Of Frame Delimiter These fields must be programmed to 01 for a valid MII management frame. |
| 29–28 OP | Operation Code Determines the frame operation. 00 Write frame operation, but not MII compliant. 01 Write frame operation for a valid MII management frame. 10 Read frame operation for a valid MII management frame. 11 Read frame operation, but not MII compliant. |
| 27–23 PA | PHY Address Specifies one of up to 32 attached PHY devices. |
| 22–18 RA | Register Address Specifies one of up to 32 registers within the specified PHY device. |
| 17–16 TA | Turn Around This field must be programmed to 10 to generate a valid MII management frame. |
| 15–0 DATA | Management Frame Data This is the field for data to be written to or read from the PHY register. |

23.4.7 MII Speed Control Register (ENET_MSCR)

MSCR provides control of the MII clock (MDC pin) frequency and allows a preamble drop on the MII management frame.

The MII_SPEED field must be programmed with a value to provide an MDC frequency of less than or equal to 2.5 MHz to be compliant with the IEEE 802.3 MII specification. The MII_SPEED must be set to a non-zero value to source a read or write management frame. After the management frame is complete, the MSCR register may optionally be cleared to turn off MDC. The MDC signal generated has a 50% duty cycle except when MII_SPEED changes during operation. This change takes effect following a rising or falling edge of MDC.

If the internal module clock is 25 MHz, programming this register to 0x0000_0004 results in an MDC as stated in the following equation:

$$25 \text{ MHz} / ((4 + 1) \times 2) = 2.5 \text{ MHz}$$

The following table shows the optimum values for MII_SPEED as a function of internal module clock frequency.

Table 23-12. Programming Examples for MSCR

| Internal MAC clock frequency | MSCR [MII_SPEED] | MDC frequency |
|------------------------------|------------------|---------------|
| 25 MHz | 0x4 | 2.50 MHz |
| 33 MHz | 0x6 | 2.36 MHz |
| 40 MHz | 0x7 | 2.50 MHz |
| 50 MHz | 0x9 | 2.50 MHz |
| 66 MHz | 0xD | 2.36 MHz |

Address: 218_8000h base + 44h offset = 218_8044h

| | | | | | | | | | | | | | | | | |

ENET_MSCR field descriptions

| Field | Description |
|-------------------|--|
| 31–11 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 10–8 HOLDTIME | Holdtime On MDIO Output IEEE802.3 clause 22 defines a minimum of 10 ns for the holdtime on the MDIO output. Depending on the host bus frequency, the setting may need to be increased. 000 1 internal module clock cycle 001 2 internal module clock cycles 010 3 internal module clock cycles 111 8 internal module clock cycles |
| 7 DIS_PRE | Disable Preamble Enables/disables prepending a preamble to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY devices do not require it. 0 Preamble enabled. 1 Preamble (32 ones) is not prepended to the MII management frame. |
| 6–1 MII_SPEED | MI Speed Controls the frequency of the MII management interface clock (MDC) relative to the internal module clock. A value of 0 in this field turns off MDC and leaves it in low voltage state. Any non-zero value results in the MDC frequency of: $1/((\text{MII_SPEED} + 1) \times 2)$ of the internal module clock frequency |
| 0 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |

23.4.8 MIB Control Register (ENET_MIBC)

MIBC is a read/write register controlling and observing the state of the MIB block. Access this register to disable the MIB block operation or clear the MIB counters. The MIB_DIS field resets to 1.

Address: 218_8000h base + 64h offset = 218_8064h

ENET_MIBC field descriptions

| Field | Description |
|----------------|--|
| 31 MIB_DIS | Disable MIB Logic If this control field is set, the MIB logic halts and does not update any MIB counters. |
| 30 MIB_IDLE | MIB Idle If this status field is set, the MIB block is not currently updating any MIB counters. |

Table continues on the next page...

ENET_MIBC field descriptions (continued)

| Field | Description |
|------------------|---|
| 29 MIB_CLEAR | MIB Clear If set, all statistics counters are reset to 0. NOTE: This field is not self-clearing. To clear the MIB counters set and then clear the field. |
| 28–0 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |

23.4.9 Receive Control Register (ENET_RCR)

Address: 218_8000h base + 84h offset = 218_8084h

ENET_RCR field descriptions

| Field | Description |
|-------------------|--|
| 31 GRS | Graceful Receive Stopped Read-only status indicating that the MAC receive datapath is stopped. |
| 30 NLC | Payload Length Check Disable Enables/disables a payload length check. 0 The payload length check is disabled. 1 The core checks the frame's payload length with the frame length/type field. Errors are indicated in the EIR[PLC] field. |
| 29–16 MAX_FL | Maximum Frame Length Resets to decimal 1518. Length is measured starting at DA and includes the CRC at the end of the frame. Transmit frames longer than MAX_FL cause the BABT interrupt to occur. Receive frames longer than MAX_FL cause the BABR interrupt to occur and set the LG field in the end of frame receive buffer descriptor. The recommended default value to be programmed is 1518 or 1522 if VLAN tags are supported. |
| 15 CFEN | MAC Control Frame Enable Enables/disables the MAC control frame. 0 MAC control frames with any opcode other than 0x0001 (pause frame) are accepted and forwarded to the client interface. 1 MAC control frames with any opcode other than 0x0001 (pause frame) are silently discarded. |
| 14 CRCFWD | Terminate/Forward Received CRC Specifies whether the CRC field of received frames is transmitted or stripped. NOTE: If padding function is enabled (PADEN = 1), CRCFWD is ignored and the CRC field is checked and always terminated and removed. 0 The CRC field of received frames is transmitted to the user application. 1 The CRC field is stripped from the frame. |
| 13 PAUFWD | Terminate/Forward Pause Frames Specifies whether pause frames are terminated or forwarded. 0 Pause frames are terminated and discarded in the MAC. 1 Pause frames are forwarded to the user application. |
| 12 PADEN | Enable Frame Padding Remove On Receive Specifies whether the MAC removes padding from received frames. 0 No padding is removed on receive by the MAC. 1 Padding is removed from received frames. |
| 11–10 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 9 RMII_10T | Enables 10-Mbps mode of the RMII or RGMII . 0 100 Mbps operation. 1 10 Mbps operation. |

Table continues on the next page...

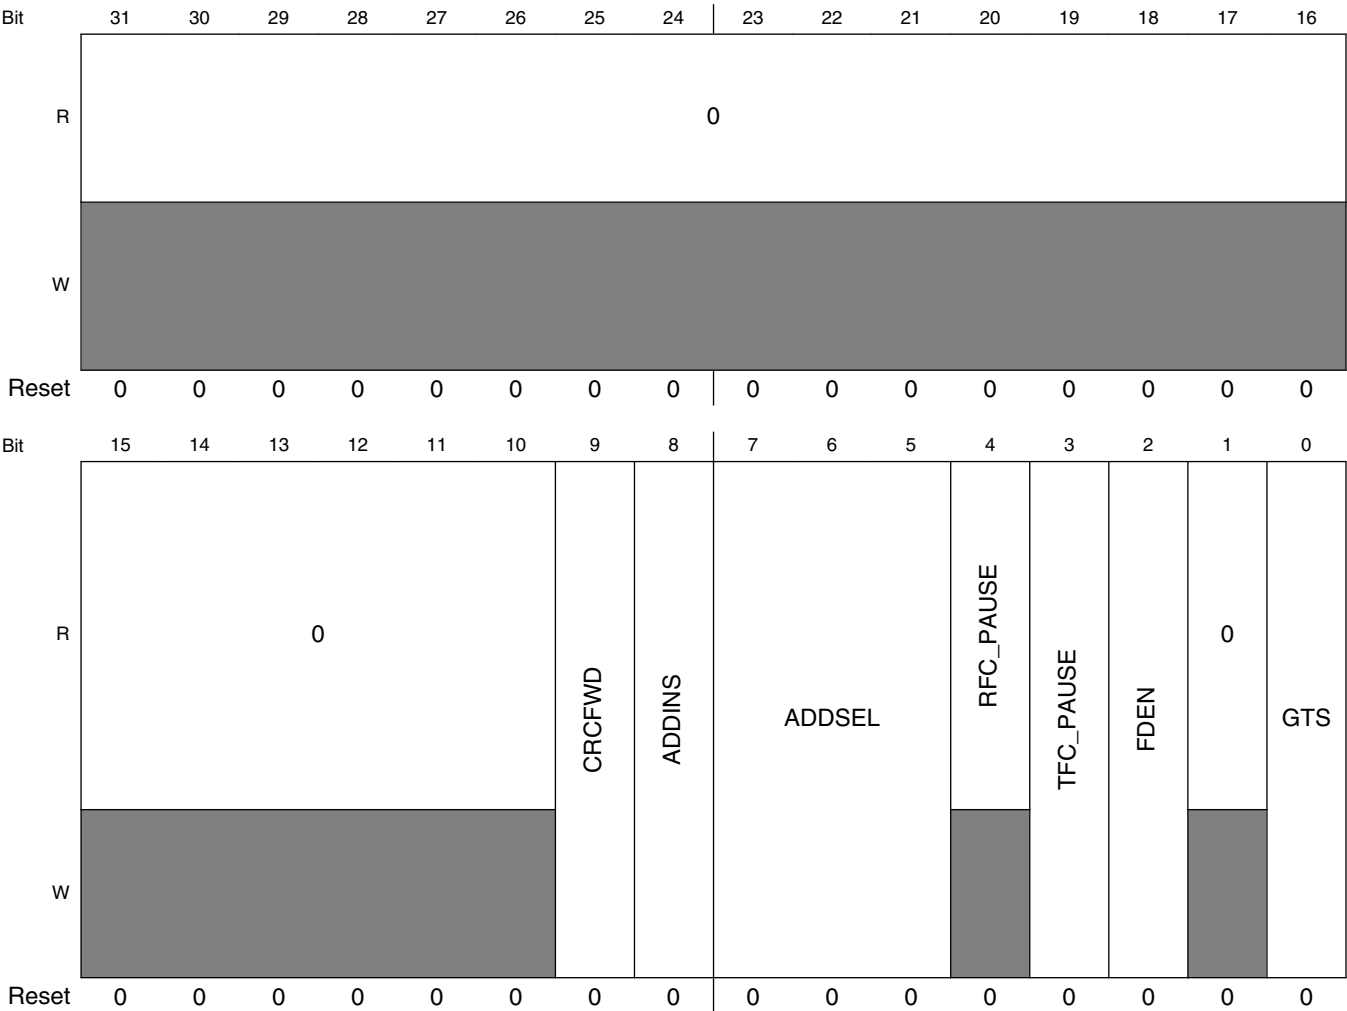

ENET_RCR field descriptions (continued)

| Field | Description |
|----------------|--|
| 8 RMII_MODE | <p>RMII Mode Enable</p> <p>Specifies whether the MAC is configured for MII mode or RMII operation , when ECR[SPEED] is cleared .</p> <p>NOTE: Do not set both RCR[RGMIEN] or RCR[RMII_MODE].</p> <p>0 MAC configured for MII mode. 1 MAC configured for RMII operation.</p> |
| 7 Reserved | <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p> |
| 6 RGMII_EN | <p>RGMII Mode Enable</p> <p>NOTE: Do not set both RCR[RGMIEN] or RCR[RMII_MODE].</p> <p>0 MAC configured for non-RGMII operation 1 MAC configured for RGMII operation. If ECR[SPEED] is set, the MAC is in RGMII 1000 Mbps mode. If ECR[SPEED] is cleared, the MAC is in RGMII 10/100 Mbps mode.</p> |
| 5 FCE | <p>Flow Control Enable</p> <p>If set, the receiver detects PAUSE frames. Upon PAUSE frame detection, the transmitter stops transmitting data frames for a given duration.</p> |
| 4 BC_REJ | <p>Broadcast Frame Reject</p> <p>If set, frames with destination address (DA) equal to 0xFFFF_FFFF_FFFF are rejected unless the PROM field is set. If BC_REJ and PROM are set, frames with broadcast DA are accepted and the MISS (M) is set in the receive buffer descriptor.</p> |
| 3 PROM | <p>Promiscuous Mode</p> <p>All frames are accepted regardless of address matching.</p> <p>0 Disabled. 1 Enabled.</p> |
| 2 MII_MODE | <p>Media Independent Interface Mode</p> <p>This field must always be set.</p> <p>0 Reserved. 1 MII or RMII mode, as indicated by the RMII_MODE field.</p> |
| 1 DRT | <p>Disable Receive On Transmit</p> <p>0 Receive path operates independently of transmit. Used for full-duplex or to monitor transmit activity in half-duplex mode. 1 Disable reception of frames while transmitting. Normally used for half-duplex mode.</p> |
| 0 LOOP | <p>Internal Loopback</p> <p>This is an MII internal loopback, therefore MII_MODE must be written to 1 and RMII_MODE must be written to 0.</p> <p>0 Loopback disabled. 1 Transmitted frames are looped back internal to the device and transmit MII output signals are not asserted. DRT must be cleared.</p> |

23.4.10 Transmit Control Register (ENET_TCR)

TCR is read/write and configures the transmit block. This register is cleared at system reset. FDEN can only be modified when ECR[ETHEREN] is cleared.

Address: 218_8000h base + C4h offset = 218_80C4h

ENET_TCR field descriptions

| Field | Description |
|-------------------|--|
| 31–10 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 9 CRCFWD | Forward Frame From Application With CRC 0 TxBD[TC] controls whether the frame has a CRC from the application. 1 The transmitter does not append any CRC to transmitted frames, as it is expecting a frame with CRC from the application. |

Table continues on the next page...

ENET_TCR field descriptions (continued)

| Field | Description |
|----------------|---|
| 8 ADDINS | <p>Set MAC Address On Transmit</p> <p>0 The source MAC address is not modified by the MAC. 1 The MAC overwrites the source MAC address with the programmed MAC address according to ADDSEL.</p> |
| 7–5 ADDSEL | <p>Source MAC Address Select On Transmit</p> <p>If ADDINS is set, indicates the MAC address that overwrites the source MAC address.</p> <p>000 Node MAC address programmed on PADDR1/2 registers. 100 Reserved. 101 Reserved. 110 Reserved.</p> |
| 4 RFC_PAUSE | <p>Receive Frame Control Pause</p> <p>This status field is set when a full-duplex flow control pause frame is received and the transmitter pauses for the duration defined in this pause frame. This field automatically clears when the pause duration is complete.</p> |
| 3 TFC_PAUSE | <p>Transmit Frame Control Pause</p> <p>Pauses frame transmission. When this field is set, EIR[GRA] is set. With transmission of data frames stopped, the MAC transmits a MAC control PAUSE frame. Next, the MAC clears TFC_PAUSE and resumes transmitting data frames. If the transmitter pauses due to user assertion of GTS or reception of a PAUSE frame, the MAC may continue transmitting a MAC control PAUSE frame.</p> <p>0 No PAUSE frame transmitted. 1 The MAC stops transmission of data frames after the current transmission is complete.</p> |
| 2 FDEN | <p>Full-Duplex Enable</p> <p>If this field is set, frames transmit independent of carrier sense and collision inputs. Only modify this bit when ECR[ETHEREN] is cleared.</p> |
| 1 Reserved | <p>This field is reserved. This read-only field is reserved and always has the value 0.</p> |
| 0 GTS | <p>Graceful Transmit Stop</p> <p>When this field is set, MAC stops transmission after any frame currently transmitted is complete and EIR[GRA] is set. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission finishes, clear GTS to restart. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS is set, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There may be old frames in the transmit FIFO that transmit when GTS is reasserted. To avoid this, clear ECR[ETHEREN] following the GRA interrupt.</p> |

23.4.11 Physical Address Lower Register (ENET_PALR)

PALR contains the lower 32 bits (bytes 0, 1, 2, 3) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 0 through 3 of the six-byte source address field when transmitting PAUSE frames. This register is not reset and you must initialize it.

Address: 218_8000h base + E4h offset = 218_80E4h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | PADDR1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

ENET_PALR field descriptions

| Field | Description |
|----------------|--|
| 31–0 PADDR1 | Pause Address Bytes 0 (bits 31:24), 1 (bits 23:16), 2 (bits 15:8), and 3 (bits 7:0) of the 6-byte individual address are used for exact match and the source address field in PAUSE frames. |

23.4.12 Physical Address Upper Register (ENET_PAUR)

PAUR contains the upper 16 bits (bytes 4 and 5) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 4 and 5 of the six-byte source address field when transmitting PAUSE frames. Bits 15:0 of PAUR contain a constant type field (0x8808) for transmission of PAUSE frames. The upper 16 bits of this register are not reset and you must initialize it.

Address: 218_8000h base + E8h offset = 218_80E8h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ENET_PAUR field descriptions

| Field | Description |
|-----------------|--|
| 31–16 PADDR2 | Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address used for exact match, and the source address field in PAUSE frames. |

Table continues on the next page...

ENET_PAUR field descriptions (continued)

| Field | Description |
|--------------|---|
| 15–0 TYPE | Type Field In PAUSE Frames These fields have a constant value of 0x8808. |

23.4.13 Opcode/Pause Duration Register (ENET_OPD)

OPD is read/write accessible. This register contains the 16-bit opcode and 16-bit pause duration fields used in transmission of a PAUSE frame. The opcode field is a constant value, 0x0001. When another node detects a PAUSE frame, that node pauses transmission for the duration specified in the pause duration field. The lower 16 bits of this register are not reset and you must initialize it.

Address: 218_8000h base + ECh offset = 218_80ECh

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ENET_OPD field descriptions

| Field | Description |
|-------------------|---|
| 31–16 OPCODE | Opcode Field In PAUSE Frames These fields have a constant value of 0x0001. |
| 15–0 PAUSE_DUR | Pause Duration Pause duration field used in PAUSE frames. |

23.4.14 Descriptor Individual Upper Address Register (ENET_IAUR)

IAUR contains the upper 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the destination address (DA) field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: 218_8000h base + 118h offset = 218_8118h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ENET_IALR field descriptions

| Field | Description |
|----------------|--|
| 31–0 IADDR2 | Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR2 contains hash index bit 31. Bit 0 of IADDR2 contains hash index bit 0. |

23.4.16 Descriptor Group Upper Address Register (ENET_GAUR)

GAUR contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. You must initialize this register.

Address: 218_8000h base + 120h offset = 218_8120h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

ENET_GAUR field descriptions

| Field | Description |
|----------------|---|
| 31–0 GADDR1 | Contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR1 contains hash index bit 63. Bit 0 of GADDR1 contains hash index bit 32. |

23.4.17 Descriptor Group Lower Address Register (ENET_GALR)

GALR contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. You must initialize this register.

Address: 218_8000h base + 124h offset = 218_8124h

ENET_GALR field descriptions

| Field | Description |
|----------------|--|
| 31–0 GADDR2 | Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR2 contains hash index bit 31. Bit 0 of GADDR2 contains hash index bit 0. |

23.4.18 Transmit FIFO Watermark Register (ENET_TFWR)

If TFR[STRFWD] is cleared, TFWR[TFWR] controls the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows you to minimize transmit latency (TFWR = 00 or 01) or allow for larger bus access latency (TFWR = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. The byte counts associated with the TFWR field may need to be modified to match a given system requirement. For example, worst case bus access latency by the transmit data DMA channel.

Address: 218_8000h base + 144h offset = 218_8144h

ENET_TFWR field descriptions

| Field | Description |
|------------------|--|
| 31–9 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 8 STRFWD | Store And Forward Enable 0 Disabled, the transmission start threshold is programmed in TFWR. 1 Enabled. |
| 7–6 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 5–0 TFWR | Transmit FIFO Write If STRFWD is cleared, this field indicates the number of bytes written to the transmit FIFO before transmission of a frame begins. NOTE: If a frame with less than the threshold is written, it is still sent independently of this threshold setting. The threshold is relevant only if the frame is larger than the threshold given. This chip may not support the maximum number of bytes written shown below. See the chip-specific information for the ENET module for this value. 000000 64 bytes written. 000001 64 bytes written. 000010 128 bytes written. 000011 192 bytes written. 111110 3968 bytes written. 111111 4032 bytes written. |

23.4.19 Receive Descriptor Ring Start Register (ENET_RDSR)

RDSR points to the beginning of the circular receive buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, it is recommended to be 128-bit aligned, that is, evenly divisible by 16.

NOTE

This register must be initialized prior to operation

Address: 218_8000h base + 180h offset = 218_8180h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ENET_RDSR field descriptions

| Field | Description |
|---------------------|---|
| 31–3 R_DES_START | Pointer to the beginning of the receive buffer descriptor queue. |
| 2–0 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |

23.4.20 Transmit Buffer Descriptor Ring Start Register (ENET_TDSR)

TDSR provides a pointer to the beginning of the circular transmit buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, it is recommended to be 128-bit aligned, that is, evenly divisible by 16.

NOTE

This register must be initialized prior to operation.

Address: 218_8000h base + 184h offset = 218_8184h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

ENET_TDSR field descriptions

| Field | Description |
|---------------------|---|
| 31–3 X_DES_START | Pointer to the beginning of the transmit buffer descriptor queue. |
| 2–0 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |

23.4.21 Maximum Receive Buffer Size Register (ENET_MRBR)

The MRBR is a user-programmable register that dictates the maximum size of all receive buffers. This value should take into consideration that the receive CRC is always written into the last receive buffer.

- To allow one maximum size frame per buffer, MRBR must be set to RCR[MAX_FL] or larger.

- To properly align the buffer, MRBR must be evenly divisible by 16. To ensure this, bits 3–0 are set to zero by the device.
- To minimize bus usage (descriptor fetches), set MRBR greater than or equal to 256 bytes.

NOTE

This register must be initialized before operation.

Address: 218_8000h base + 188h offset = 218_8188h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ENET_FTRL field descriptions

| Field | Description |
|-------------------|--|
| 31–14 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 13–0 TRUNC_FL | Frame Truncation Length Indicates the value a receive frame is truncated, if it is greater than this value. Must be greater than or equal to RCR[MAX_FL]. NOTE: Truncation happens at TRUNC_FL. However, when truncation occurs, the application (FIFO) may receive less data, guaranteeing that it never receives more than the set limit. |

23.4.31 Transmit Accelerator Function Configuration (ENET_TACC)

TACC controls accelerator actions when sending frames. The register can be changed before or after each frame, but it must remain unmodified during frame writes into the transmit FIFO.

The TFWR[STRFWD] field must be set to use the checksum feature.

Address: 218_8000h base + 1C0h offset = 218_81C0h

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Memory map/register definition

ENET_TACC field descriptions

| Field | Description |
|------------------|--|
| 31–5 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 4 PROCHK | Enables insertion of protocol checksum. 0 Checksum not inserted. 1 If an IP frame with a known protocol is transmitted, the checksum is inserted automatically into the frame. The checksum field must be cleared. The other frames are not modified. |
| 3 IPCHK | Enables insertion of IP header checksum. 0 Checksum is not inserted. 1 If an IP frame is transmitted, the checksum is inserted automatically. The IP header checksum field must be cleared. If a non-IP frame is transmitted the frame is not modified. |
| 2–1 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 0 SHIFT16 | TX FIFO Shift-16 0 Disabled. 1 Indicates to the transmit data FIFO that the written frames contain two additional octets before the frame data. This means the actual frame begins at bit 16 of the first word written into the FIFO. This function allows putting the frame payload on a 32-bit boundary in memory, as the 14-byte Ethernet header is extended to a 16-byte header. |

23.4.32 Receive Accelerator Function Configuration (ENET_RACC)

Address: 218_8000h base + 1C4h offset = 218_81C4h

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|---|---|---------|---------|---|---|---|--------|-------|--------|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

ENET_RACC field descriptions

| Field | Description |
|------------------|---|
| 31–8 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 7 SHIFT16 | RX FIFO Shift-16 When this field is set, the actual frame data starts at bit 16 of the first word read from the RX FIFO aligning the Ethernet payload on a 32-bit boundary. NOTE: This function only affects the FIFO storage and has no influence on the statistics, which use the actual length of the frame received. 0 Disabled. 1 Instructs the MAC to write two additional bytes in front of each frame received into the RX FIFO. |
| 6 LINEDIS | Enable Discard Of Frames With MAC Layer Errors 0 Frames with errors are not discarded. 1 Any frame received with a CRC, length, or PHY error is automatically discarded and not forwarded to the user application interface. |
| 5–3 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 2 PRODIS | Enable Discard Of Frames With Wrong Protocol Checksum 0 Frames with wrong checksum are not discarded. 1 If a TCP/IP, UDP/IP, or ICMP/IP frame is received that has a wrong TCP, UDP, or ICMP checksum, the frame is discarded. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared). |
| 1 IPDIS | Enable Discard Of Frames With Wrong IPv4 Header Checksum |

Table continues on the next page...

ENET_RACC field descriptions (continued)

| Field | Description |
|-------------|---|
| | 0 Frames with wrong IPv4 header checksum are not discarded. 1 If an IPv4 frame is received with a mismatching header checksum, the frame is discarded. IPv6 has no header checksum and is not affected by this setting. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared). |
| 0 PADREM | Enable Padding Removal For Short IP Frames 0 Padding not removed. 1 Any bytes following the IP payload section of the frame are removed from the frame. |

23.4.33 Timer Control Register (ENET_ATCR)

ATCR command fields can trigger the corresponding events directly. It is not necessary to preserve any of the configuration fields when a command field is set in the register, that is, no read-modify-write is required. The fields are automatically cleared after the command completes.

Address: 218_8000h base + 400h offset = 218_8400h

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

ENET_ATCR field descriptions

| Field | Description |
|-------------------|--|
| 31–14 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 13 SLAVE | Enable Timer Slave Mode 0 The timer is active and all configuration fields in this register are relevant. 1 The internal timer is disabled and the externally provided timer value is used. All other fields, except CAPTURE, in this register have no effect. CAPTURE can still be used to capture the current timer value. |
| 12 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |

Table continues on the next page...

ENET_ATCR field descriptions (continued)

| Field | Description |
|-----------------|--|
| 11 CAPTURE | Capture Timer Value 0 No effect. 1 The current time is captured and can be read from the ATVR register. |
| 10 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 9 RESTART | Reset Timer Resets the timer to zero. This has no effect on the counter enable. If the counter is enabled when this field is set, the timer is reset to zero and starts counting from there. When set, all other fields are ignored during a write. |
| 8 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 7 PINPER | Enables event signal output assertion on period event. NOTE: Not all devices contain the event signal output. See the chip configuration details. 0 Disable. 1 Enable. |
| 6–5 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 4 PEREN | Enable Periodical Event 0 Disable. 1 A period event interrupt can be generated (EIR[TS_TIMER]) and the event signal output is asserted when the timer wraps around according to the periodic setting ATPER. The timer period value must be set before setting this bit. NOTE: Not all devices contain the event signal output. See the chip configuration details. |
| 3 OFFRST | Reset Timer On Offset Event 0 The timer is not affected and no action occurs, besides clearing OFFEN, when the offset is reached. 1 If OFFEN is set, the timer resets to zero when the offset setting is reached. The offset event does not cause a timer interrupt. |
| 2 OFFEN | Enable One-Shot Offset Event 0 Disable. 1 The timer can be reset to zero when the given offset time is reached (offset event). The field is cleared when the offset event is reached, so no further event occurs until the field is set again. The timer offset value must be set before setting this field. |
| 1 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 0 EN | Enable Timer 0 The timer stops at the current value. 1 The timer starts incrementing. |

23.4.34 Timer Value Register (ENET_ATVR)

Address: 218_8000h base + 404h offset = 218_8404h

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

ENET_ATOFF field descriptions

| Field | Description |
|----------------|---|
| 31–0 OFFSET | Offset value for one-shot event generation. When the timer reaches the value, an event can be generated to reset the counter. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds. |

23.4.36 Timer Period Register (ENET_ATPER)

Address: 218_8000h base + 40Ch offset = 218_840Ch

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

ENET_ATPER field descriptions

| Field | Description |
|----------------|--|
| 31–0 PERIOD | Value for generating periodic events. Each instance the timer reaches this value, the period event occurs and the timer restarts. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds. The value should be initialized to 1,000,000,000 (1×10^9) to represent a timer wrap around of one second. The increment value set in ATINC should be set to the true nanoseconds of the period of clock ts_clk, hence implementing a true 1 second counter. |

23.4.37 Timer Correction Register (ENET_ATCOR)

Address: 218_8000h base + 410h offset = 218_8410h

| | | | | | | | | | | | | | | | | |
|-------|----|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

ENET_ATCOR field descriptions

| Field | Description |
|----------------|--|
| 31 Reserved | This field is reserved. This read-only field is reserved and always has the value 0. |
| 30–0 COR | Correction Counter Wrap-Around Value Defines after how many timer clock cycles (ts_clk) the correction counter should be reset and trigger a correction increment on the timer. The amount of correction is defined in ATINC[INC_CORR]. A value of 0 disables the correction counter and no corrections occur. NOTE: This value is given in clock cycles, not in nanoseconds as all other values. |

23.4.38 Time-Stamping Clock Period Register (ENET_ATINC)

Address: 218_8000h base + 414h offset = 218_8414h

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |

ENET_TCCR_n field descriptions

| Field | Description |
|-------------|--|
| 31–0 TCC | Timer Capture Compare This register is double buffered between the module clock and 1588 clock domains. |

ENET_TCCR_n field descriptions (continued)

| Field | Description |
|-------|---|
| | <p>When configured for compare, the 1588 clock domain updates with the value in the module clock domain whenever the Timer Channel is first enabled and on each subsequent compare. Write to this register with the first compare value before enabling the Timer Channel. When the Timer Channel is enabled, write the second compare value either immediately, or at least before the first compare occurs. After each compare, write the next compare value before the previous compare occurs and before clearing the Timer Flag.</p> <p>The compare occurs one 1588 clock cycle after the IEEE 1588 Counter increments past the compare value in the 1588 clock domain. If the compare value is less than the value of the 1588 Counter when the Timer Channel is first enabled, then the compare does not occur until following the next overflow of the 1588 Counter. If the compare value is greater than the IEEE 1588 Counter when the 1588 Counter overflows, or the compare value is less than the value of the IEEE 1588 Counter after the overflow, then the compare occurs one 1588 clock cycle following the overflow.</p> <p>When configured for Capture, the value of the IEEE 1588 Counter is captured into the 1588 clock domain and then updated into the module clock domain, provided the Timer Flag is clear. Always read the capture value before clearing the Timer Flag.</p> |

23.4.43 Statistic event counters

The following table shows the locations of the statistic event counters in the module's memory map. Definitions of these registers can be found in IETF RFC 2819, *Remote Network Monitoring Management Information Base*.

NOTE

All counters are 32 bits wide with the top 16 bits reserved/ignored, except for the following:

- RMON_T_OCTETS
- IEEE_T_OCTETS_OK
- RMON_R_OCTETS
- IEEE_R_OCTETS_OK

Table 23-56. Statistic event counters memory map

| Address offset from ENET base address | Register |
|---------------------------------------|--|
| 0x200 | Count of frames not counted correctly (RMON_T_DROP). NOTE: Counter not implemented because it is not applicable (read 0 always). |
| 0x204 | RMON Tx packet count (RMON_T_PACKETS) |
| 0x208 | RMON Tx Broadcast Packets (RMON_T_BC_PKT) |
| 0x20C | RMON Tx Multicast Packets (RMON_T_MC_PKT) |
| 0x210 | RMON Tx Packets w CRC/Align error (RMON_T_CRC_ALIGN) |
| 0x214 | RMON Tx Packets < 64 bytes, good CRC (RMON_T_UNDERSIZE) |

Table continues on the next page...

Table 23-56. Statistic event counters memory map (continued)

| Address offset from ENET base address | Register |
|---------------------------------------|--|
| 0x218 | RMON Tx Packets > MAX_FL bytes, good CRC (RMON_T_OVERSIZE) |
| 0x21C | RMON Tx Packets < 64 bytes, bad CRC (RMON_T_FRAG) |
| 0x220 | RMON Tx Packets > MAX_FL bytes, bad CRC (RMON_T_JAB) |
| 0x224 | RMON Tx collision count (RMON_T_COL) |
| 0x228 | RMON Tx 64 byte packets (RMON_T_P64) |
| 0x22C | RMON Tx 65 to 127 byte packets (RMON_T_P65TO127n) |
| 0x230 | RMON Tx 128 to 255 byte packets (RMON_T_P128TO255n) |
| 0x234 | RMON Tx 256 to 511 byte packets (RMON_T_P256TO511) |
| 0x238 | RMON Tx 512 to 1023 byte packets (RMON_T_P512TO1023) |
| 0x23C | RMON Tx 1024 to 2047 byte packets (RMON_T_P1024TO2047) |
| 0x240 | RMON Tx packets w > 2048 bytes (RMON_T_P_GTE2048) |
| 0x244 | RMON Tx Octets (RMON_T_OCTETS) |
| 0x248 | Count of frames not counted correctly (IEEE_T_DROP). NOTE: Counter not implemented because it is not applicable (read 0 always). |
| 0x24C | Frames Transmitted OK (IEEE_T_FRAME_OK) |
| 0x250 | Frames Transmitted with Single Collision (IEEE_T_1COL) |
| 0x254 | Frames Transmitted with Multiple Collisions (IEEE_T_MCOL) |
| 0x258 | Frames Transmitted after Deferral Delay (IEEE_T_DEF) |
| 0x25C | Frames Transmitted with Late Collision (IEEE_T_LCOL) |
| 0x260 | Frames Transmitted with Excessive Collisions (IEEE_T_EXCOL) |
| 0x264 | Frames Transmitted with Tx FIFO Underrun (IEEE_T_MACERR) |
| 0x268 | Frames Transmitted with Carrier Sense Error (IEEE_T_CSERR) |
| 0x26C | Frames Transmitted with SQE Error (IEEE_T_SQE). NOTE: Counter not implemented because there is no SQE information available (read 0 always). |
| 0x270 | Flow Control Pause frames transmitted (IEEE_T_FDXFC) |
| 0x274 | Octet count for Frames Transmitted w/o Error (IEEE_T_OCTETS_OK). NOTE: Counts total octets (includes header and FCS fields). |
| 0x284 | RMON Rx packet count (RMON_R_PACKETS) |
| 0x288 | RMON Rx Broadcast Packets (RMON_R_BC_PKT) |
| 0x28C | RMON Rx Multicast Packets (RMON_R_MC_PKT) |
| 0x290 | RMON Rx Packets w CRC/Align error (RMON_R_CRC_ALIGN) |

Table continues on the next page...

Table 23-56. Statistic event counters memory map (continued)

| Address offset from ENET base address | Register |
|---------------------------------------|---|
| 0x294 | RMON Rx Packets < 64 bytes, good CRC (RMON_R_UNDERSIZE) |
| 0x298 | RMON Rx Packets > MAX_FL, good CRC (RMON_R_OVERSIZE) |
| 0x29C | RMON Rx Packets < 64 bytes, bad CRC (RMON_R_FRAG) |
| 0x2A0 | RMON Rx Packets > MAX_FL bytes, bad CRC (RMON_R_JAB) |
| 0x2A4 | Reserved (RMON_R_RESVD_0) |
| 0x2A8 | RMON Rx 64 byte packets (RMON_R_P64) |
| 0x2AC | RMON Rx 65 to 127 byte packets (RMON_R_P65TO127) |
| 0x2B0 | RMON Rx 128 to 255 byte packets (RMON_R_P128TO255) |
| 0x2B4 | RMON Rx 256 to 511 byte packets (RMON_R_P256TO511) |
| 0x2B8 | RMON Rx 512 to 1023 byte packets (RMON_R_P512TO1023) |
| 0x2BC | RMON Rx 1024 to 2047 byte packets (RMON_R_P1024TO2047) |
| 0x2C0 | RMON Rx packets w > 2048 bytes (RMON_R_P_GTE2048) |
| 0x2C4 | RMON Rx Octets (RMON_R_OCTETS) |
| 0x2C8 | Count of frames not counted correctly (IEEE_R_DROP). NOTE: Counter increments if a frame with invalid/missing SFD character is detected and has been dropped. None of the other counters increments if this counter increments. |
| 0x2CC | Frames Received OK (IEEE_R_FRAME_OK) |
| 0x2D0 | Frames Received with CRC Error (IEEE_R_CRC) |
| 0x2D4 | Frames Received with Alignment Error (IEEE_R_ALIGN) |
| 0x2D7 | Receive FIFO Overflow count (IEEE_R_MACERR) |
| 0x2DC | Flow Control Pause frames received (IEEE_R_FDXFC) |
| 0x2E0 | Octet count for Frames Rcvd w/o Error (IEEE_R_OCTETS_OK). Counts total octets (includes header and FCS fields) |

23.5 Functional description

This section provides a complete functional description of the MAC-NET core.

23.5.1 Ethernet MAC frame formats

The IEEE 802.3 standard defines the Ethernet frame format as follows:

Functional description

- Minimum length of 64 bytes
- Maximum length of 1518 bytes excluding the preamble and the start frame delimiter (SFD) bytes

An Ethernet frame consists of the following fields:

- Seven bytes preamble
- Start frame delimiter (SFD)
- Two address fields
- Length or type field
- Data field
- Frame check sequence (CRC value)
- Extension field is defined only for Gigabit Ethernet half-duplex implementations and is not supported by the MAC core

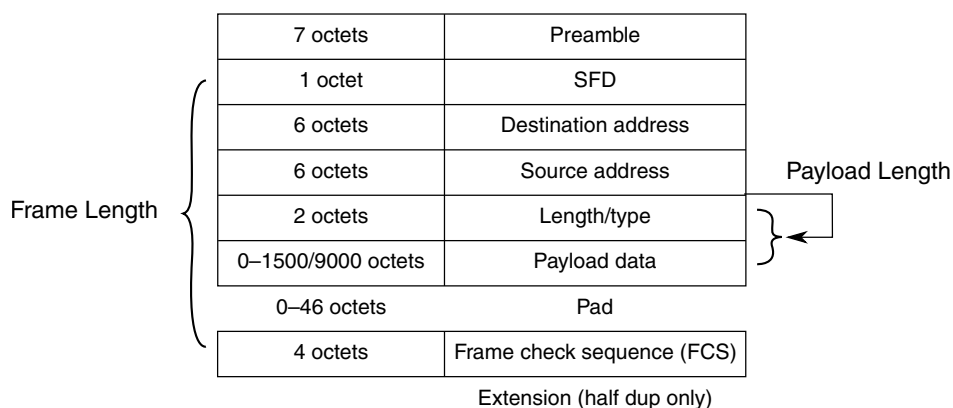

Figure 23-52. MAC frame format overview

Optionally, MAC frames can be VLAN-tagged with an additional four-byte field inserted between the MAC source address and the type/length field. VLAN tagging is defined by the IEEE P802.1q specification. VLAN-tagged frames have a maximum length of 1522 bytes, excluding the preamble and the SFD bytes.

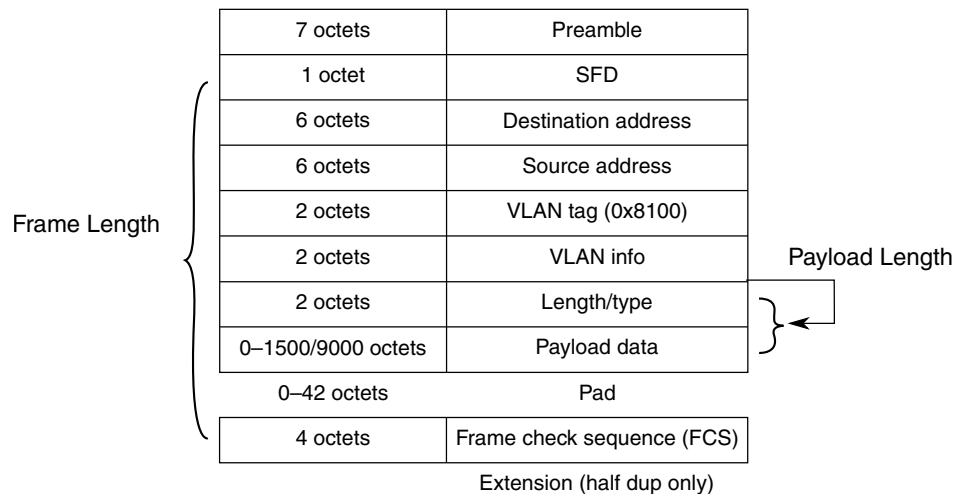

Figure 23-53. VLAN-tagged MAC frame format overview

Table 23-57. MAC frame definition

| Term | Description |
|--------------------------------|--|
| Frame length | Defines the length, in octets, of the complete frame without preamble and SFD. A frame has a valid length if it contains at least 64 octets and does not exceed the programmed maximum length. |
| Payload length | <p>The length/type field indicates the length of the frame's payload section. The most significant byte is sent/received first.</p> <ul style="list-style-type: none"> If the length/type field is set to a value less than 46, the payload is padded so that the minimum frame length requirement (64 bytes) is met. For VLAN-tagged frames, a value less than 42 indicates a padded frame. If the length/type field is set to a value larger than the programmed frame maximum length (e.g. 1518) it is interpreted as a type field. |
| Destination and source address | 48-bit MAC addresses. The least significant byte is sent/received first and the first two least significant bits of the MAC address distinguish MAC frames, as detailed in MAC address check . |

Note

Although the IEEE specification defines a maximum frame length, the MAC core provides the flexibility to program any value for the frame maximum length.

23.5.1.1 Pause Frames

The receiving device generates a pause frame to indicate a congestion to the emitting device, which should stop sending data.

Pause frames are indicated by the length/type set to 0x8808. The two first bytes of a pause frame following the type, defines a 16-bit opcode field set to 0x0001 always. A 16-bit pause quanta is defined in the frame payload bytes 2 (P1) and 3 (P2) as defined in the following table. The P1 pause quanta byte is the most significant.

Table 23-58. Pause Frame Format (Values in Hex)

| | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|------|-----|-------------------------------|----|----|----|----------|----|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 |
| 55 | 55 | 55 | 55 | 55 | 55 | 55 | D5 | 01 | 80 | C2 | 00 | 00 | 01 |
| Preamble | | | | | | | SFD | Multicast Destination Address | | | | | |
| 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 –68 | |

| Source Address | | | | | | Type | | Opcode | | P1 | P2 | pad (42) | |
| 69 | 70 | 71 | 72 | | | | | | | | | | |
| 26 | 6B | AE | 0A | | | | | | | | | | |
| CRC-32 | | | | | | | | | | | | | |

There is no payload length field found within a pause frame and a pause frame is always padded with 42 bytes (0x00).

If a pause frame with a pause value greater than zero (XOFF condition) is received, the MAC stops transmitting data as soon the current frame transfer is completed. The MAC stops transmitting data for the value defined in pause quanta. One pause quanta fraction refers to 512 bit times.

If a pause frame with a pause value of zero (XON condition) is received, the transmitter is allowed to send data immediately (see [Full-duplex flow control operation](#) for details).

23.5.1.2 Magic packets

A magic packet is a unicast, multicast, or broadcast packet, which carries a defined sequence in the payload section.

Magic packets are received and inspected only under specific conditions as described in [Magic packet detection](#).

The defined sequence to decode a magic packet is formed with a synchronization stream which consists of six consecutive 0xFF bytes, and is followed by sequence of sixteen consecutive unicast MAC addresses of the node to be awakened.

This sequence can be located anywhere in the magic packet payload. The magic packet is formed with a standard Ethernet header, optional padding, and CRC.

23.5.2 IP and higher layers frame format

The following sections use the term datagram to describe the protocol specific data unit that is found within the payload section of its container entity.

For example, an IP datagram specifies the payload section of an Ethernet frame. A TCP datagram specifies the payload section within an IP datagram.

23.5.2.1 Ethernet types

IP datagrams are carried in the payload section of an Ethernet frame. The Ethernet frame type/length field discriminates several datagram types.

The following table lists the types of interest:

Table 23-59. Ethernet type value examples

| Type | Description |
|--------|--|
| 0x8100 | VLAN-tagged frame. The actual type is found 4 octets later in the frame. |
| 0x0800 | IPv4 |
| 0x0806 | ARP |
| 0x86DD | IPv6 |

23.5.2.2 IPv4 datagram format

The following figure shows the IP Version 4 (IPv4) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words. The first byte sent/received is the leftmost byte of the first word (in other words, version/IHL field).

The IP header can contain further options, which are always padded if necessary to guarantee the payload following the header is aligned to a 32-bit boundary.

The IP header is immediately followed by the payload, which can contain further protocol headers (for example, TCP or UDP, as indicated by the protocol field value). The complete IP datagram is transported in the payload section of an Ethernet frame.

Table 23-60. IPv4 header format

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|----|----|----|-----|----|----|----|----------|----|----|----|----|----|----|----|-----------------|----|----|----|-----------------|----|---|---|---|---|---|---|---|---|---|---|--|--|--|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | |
| Version | | | | IHL | | | | TOS | | | | | | | | Length | | | | | | | | | | | | | | | | | | | |
| Fragment ID | | | | | | | | | | | | | | | | Flags | | | | Fragment offset | | | | | | | | | | | | | | | |
| TTL | | | | | | | | Protocol | | | | | | | | Header checksum | | | | | | | | | | | | | | | | | | | |
| Source address | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Destination address | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Options | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Table 23-61. IPv4 header fields

| Field name | Description |
|-------------------------------------|--|
| Version | 4-bit IP version information. 0x4 for IPv4 frames. |
| IHL | 4-bit Internet header length information. Determines number of 32-bit words found within the IP header. If no options are present, the default value is 0x5. |
| TOS | Type of service/DiffServ field. |
| Length | Total length of the datagram in bytes, including all octets of header and payload. |
| Fragment ID, flags, fragment offset | Fields used for IP fragmentation. |
| TTL | Time-to-live. In effect, is decremented at each router arrival. If zero, datagram must be discarded. |
| Protocol | Identifier of protocol that follows in the datagram. |
| Header checksum | Checksum of IP header. For computational purposes, this field's value is zero. |
| Source address | Source IP address. |
| Destination address | Destination IP address. |

23.5.2.3 IPv6 datagram format

The following figure shows the IP version 6 (IPv6) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words and has a fixed length of ten words (40 bytes). The next header field identifies the type of the header that follows the IPv6 header. It is defined similar to the protocol identifier within IPv4, with new definitions for identifying extension headers. These headers can be inserted between the IPv6 header and the protocol header, which will shift the protocol header accordingly. The accelerator currently only supports IPv6 without extension headers (in other words, the next header specifies TCP, UDP, or IMCP).

The first byte sent/received is the leftmost byte of the first word (in other words, version/traffic class fields).

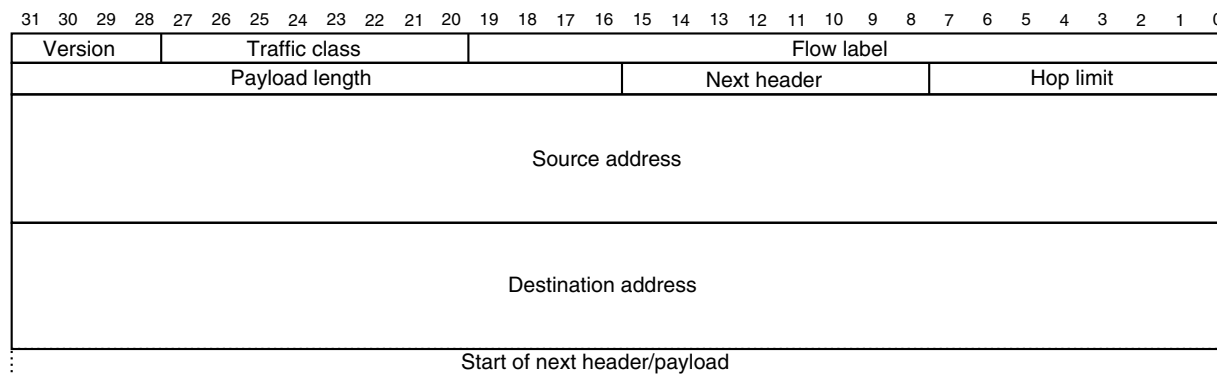

**Figure 23-54. IPv6 header format**

Table 23-62. IPv6 header fields

| Field name | Description |
|---------------------|---|
| Version | 4-bit IP version information. 0x6 for all IPv6 frames. |
| Traffic class | 8-bit field defining the traffic class. |
| Flow label | 20-bit flow label identifying frames of the same flow. |
| Payload length | 16-bit length of the datagram payload in bytes. It includes all octets following the IPv6 header. |
| Next header | Identifies the header that follows the IPv6 header. This can be the protocol header or any IPv6 defined extension header. |
| Hop limit | Hop counter, decremented by one by each station that forwards the frame. If hop limit is 0 the frame must be discarded. |
| Source address | 128-bit IPv6 source address. |
| Destination address | 128-bit IPv6 destination address. |

23.5.2.4 Internet Control Message Protocol (ICMP) datagram format

An internet control message protocol (ICMP) is found following the IP header, if the protocol identifier is 1. The ICMP datagram has a four-octet header followed by additional message data.

Table 23-63. ICMP header format

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Type | | | | | | | | Code | | | | | | | | Checksum | | | | | | | | | | | | | | | |
| ICMP message data | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Table 23-64. IP header fields

| Field name | Description |
|------------|--|
| Type | 8-bit type information |
| Code | 8-bit code that is related to the message type |
| Checksum | 16-bit one's complement checksum over the complete ICMP datagram |

23.5.2.5 User Datagram Protocol (UDP) datagram format

A user datagram protocol header is found after the IP header, when the protocol identifier is 17.

The payload of the datagram is after the UDP header. The header byte order follows the conventions given for the IP header above.

Table 23-65. UDP header format

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|------------------|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Source port | | | | | | | | | | | | Destination port | | | | | | | | | | | | | | | | | | | |
| Length | | | | | | | | | | | | Checksum | | | | | | | | | | | | | | | | | | | |

Table 23-66. UDP header fields

| Field name | Description |
|------------------|--|
| Source port | Source application port |
| Destination port | Destination application port |
| Length | Length of user data which immediately follows the header, including the UDP header (that is, minimum value is 8) |
| Checksum | Checksum over the complete datagram and some IP header information |

23.5.2.6 TCP datagram format

A TCP header is found following the IP header, when the protocol identifier has a value of 6.

The TCP payload immediately follows the TCP header.

Table 23-67. TCP header format

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Source port | | | | | | | | | | | | | | | | Destination port | | | | | | | | | | | | | | | |
| Sequence number | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Acknowledgement number | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Offset | | | | | | | | | | | | Flags | | | | Window | | | | | | | | | | | | | | | |
| Checksum | | | | | | | | | | | | | | | | Urgent pointer | | | | | | | | | | | | | | | |
| Options | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Table 23-68. TCP header fields

| Field name | Description |
|------------------|---|
| Source port | Source application port |
| Destination port | Destination application port |
| Sequence number | Transmit sequence number |
| Ack. number | Receive sequence number |
| Offset | Data offset, which is number of 32-bit words within TCP header — if no options selected, defaults to value of 5 |

Table continues on the next page...

Table 23-68. TCP header fields (continued)

| Field name | Description |
|------------|---|
| Flags | URG, ACK, PSH, RST, SYN, FIN flags |
| Window | TCP receive window size information |
| Checksum | Checksum over the complete datagram (TCP header and data) and IP header information |
| Options | Additional 32-bit words for protocol options |

23.5.3 IEEE 1588 message formats

The following sections describe the IEEE 1588 message formats.

23.5.3.1 Transport encapsulation

The precision time protocol (PTP) datagrams are encapsulated in Ethernet frames using the UDP/IP transport mechanism, or optionally, with the newer 1588v2 directly in Ethernet frames (layer 2).

Typically, multicast addresses are used to allow efficient distribution of the synchronization messages.

23.5.3.1.1 UDP/IP

The 1588 messages (v1 and v2) can be transported using UDP/IP multicast messages.

[Table 23-69](#) shows IP multicast groups defined for PTP. The table also shows their respective MAC layer multicast address mapping according to RFC 1112 (last three octets of IP follow the fixed value of 01-00-5E).

Table 23-69. UDP/IP multicast domains

| Name | IP Address | MAC Address mapping |
|---------------------|-------------|---------------------|
| DefaultPTPdomain | 224.0.1.129 | 01-00-5E-00-01-81 |
| AlternatePTPdomain1 | 224.0.1.130 | 01-00-5E-00-01-82 |
| AlternatePTPdomain2 | 224.0.1.131 | 01-00-5E-00-01-83 |
| AlternatePTPdomain3 | 224.0.1.132 | 01-00-5E-00-01-84 |

Table 23-70. UDP port numbers

| Message type | UDP port | Note |
|--------------|----------|---|
| Event | 319 | Used for SYNC and DELAY_REQUEST messages |
| General | 320 | All other messages (for example, follow-up, delay-response) |

23.5.3.1.2 Native Ethernet (PTPv2)

In addition to using UDP/IP frames, IEEE 1588v2 defines a native Ethernet frame format that uses ethertype = 0x88F7. The payload of the Ethernet frame immediately contains the PTP datagram, starting with the PTPv2 header.

Besides others, version 2 adds a peer delay mechanism to allow delay measurements between individual point-to-point links along a path over multiple nodes. The following multicast domains are also defined in PTPv2.

Table 23-71. PTPv2 multicast domains

| Name | MAC address |
|---------------------|-------------------|
| Normal messages | 01-1B-19-00-00-00 |
| Peer delay messages | 01-80-C2-00-00-0E |

23.5.3.2 PTP header

All PTP frames contain a common header that determines the protocol version and the type of message, which defines the remaining content of the message.

All multi-octet fields are transmitted in big-endian order (the most significant byte is transmitted/received first).

The last four bits of versionPTP are at the same position (second byte) for PTPv1 and PTPv2 headers. This allows accurate identification by inspecting the first two bytes of the message.

23.5.3.2.1 PTPv1 header

Table 23-72. Common PTPv1 message header

| Offset | Octets | Bits | | | | | | | |
|--------|--------|-------------------------------|---|---|---|---|---|---|---|
| | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0 | 2 | versionPTP = 0x0001 | | | | | | | |
| 2 | 2 | versionNetwork | | | | | | | |
| 4 | 16 | subdomain | | | | | | | |
| 20 | 1 | messageType | | | | | | | |
| 21 | 1 | sourceCommunicationTechnology | | | | | | | |
| 22 | 6 | sourceUuid | | | | | | | |
| 28 | 2 | sourcePortId | | | | | | | |
| 30 | 2 | sequenceId | | | | | | | |

Table continues on the next page...

Table 23-72. Common PTPv1 message header (continued)

| Offset | Octets | Bits | | | | | | | |
|--------|--------|----------|---|---|---|---|---|---|---|
| | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 32 | 1 | control | | | | | | | |
| 33 | 1 | 0x00 | | | | | | | |
| 34 | 2 | flags | | | | | | | |
| 36 | 4 | reserved | | | | | | | |

The type of message is encoded in the messageType and control fields as shown in [Table 23-73](#) :

Table 23-73. PTPv1 message type identification

| messageType | control | Message Name | Message |
|-------------|---------|--------------|-----------------|
| 0x01 | 0x0 | SYNC | Event message |
| 0x01 | 0x1 | DELAY_REQ | Event message |
| 0x02 | 0x2 | FOLLOW_UP | General message |
| 0x02 | 0x3 | DELAY_RESP | General message |
| 0x02 | 0x4 | MANAGEMENT | General message |
| other | other | — | Reserved |

The field sequenceId is used to non-ambiguously identify a message.

23.5.3.2.2 PTPv2 header

Table 23-74. Common PTPv2 message header

| Offset | Octets | Bits | | | | | | | |
|--------|--------|------------------------|---|---|---|------------------|---|---|---|
| | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0 | 1 | transportSpecific | | | | messageId | | | |
| 1 | 1 | reserved | | | | versionPTP = 0x2 | | | |
| 2 | 2 | messageLength | | | | | | | |
| 4 | 1 | domainNumber | | | | | | | |
| 5 | 1 | reserved | | | | | | | |
| 6 | 2 | flags | | | | | | | |
| 8 | 8 | correctionField | | | | | | | |
| 16 | 4 | reserved | | | | | | | |
| 20 | 10 | sourcePortIdentity | | | | | | | |
| 30 | 2 | sequenceId | | | | | | | |
| 32 | 1 | control | | | | | | | |
| 33 | 1 | logMeanMessageInterval | | | | | | | |

The type of message is encoded in the field `messageId` as follows:

Table 23-75. PTPv2 message type identification

| messageId | Message name | Message |
|-----------|----------------------|-----------------|
| 0x0 | SYNC | Event message |
| 0x1 | DELAY_REQ | Event message |
| 0x2 | PATH_DELAY_REQ | Event message |
| 0x3 | PATH_DELAY_RESP | Event message |
| 0x4–0x7 | — | Reserved |
| 0x8 | FOLLOW_UP | General message |
| 0x9 | DELAY_RESP | General message |
| 0xa | PATH_DELAY_FOLLOW_UP | General message |
| 0xb | ANNOUNCE | General message |
| 0xc | SIGNALING | General message |
| 0xd | MANAGEMENT | General message |

The PTPv2 flags field contains further details on the type of message, especially if one-step or two-step implementations are used. The one- or two-step implementation is controlled by the `TWO_STEP` bit in the first octet of the flags field as shown below. Reserved bits are cleared.

Table 23-76. PTPv2 message flags field definitions

| Bit | Name | Description |
|-----|------------------|---|
| 0 | ALTERNATE_MASTER | See IEEE 1588 Clause 17.4 |
| 1 | TWO_STEP | 1 Two-step clock 0 One-step clock |
| 2 | UNICAST | 1 Transport layer address uses a unicast destination address 0 Multicast is used |
| 3 | — | Reserved |
| 4 | — | Reserved |
| 5 | Profile specific | |
| 6 | Profile specific | |
| 7 | — | Reserved |

23.5.4 MAC receive

The MAC receive engine performs the following tasks:

- Check frame framing

- Remove frame preamble and frame SFD field
- Discard frame based on frame destination address field
- Terminate pause frames
- Check frame length
- Remove payload padding if it exists
- Calculate and verify CRC-32
- Write received frames in the core receive FIFO

If the MAC is programmed to operate in half-duplex mode, it will also check if the frame is received with a collision.

Figure 23-55. MAC receive flow

23.5.4.1 Collision detection in half-duplex mode

If the packet is received with a collision detected during reception of the first 64 bytes, the packet is discarded (if frame size was less than ~14 octets) or transmitted to the user application with an error and RxBD[CE] set.

23.5.4.2 Preamble processing

The IEEE 802.3 standard allows a maximum size of 56 bits (seven bytes) for the preamble, while the MAC core allows any preamble length, including zero length preamble.

The MAC core checks for the start frame delimiter (SFD) byte. If the next byte of the preamble, which is different from 0x55, is not 0xD5, the frame is discarded.

Although the IEEE specification dictates that the inner-packet gap should be at least 96 bits, the MAC core is designed to accept frames separated by only 64 10/100 Mbps operation (MII) bits.

The MAC core removes the preamble and SFD bytes.

23.5.4.3 MAC address check

The destination address bit 0 differentiates between multicast and unicast addresses.

- If bit 0 is 0, the MAC address is an individual (unicast) address.
- If bit 0 is 1, the MAC address defines a group (multicast) address.
- If all 48 bits of the MAC address are set, it indicates a broadcast address.

23.5.4.3.1 Unicast address check

If a unicast address is received, the destination MAC address is compared to the node MAC address programmed by the host in the PADDR1/2 registers.

If the destination address matches any of the programmed MAC addresses, the frame is accepted.

If Promiscuous mode is enabled ($\text{RCR}[\text{PROM}] = 1$) no address checking is performed and all unicast frames are accepted.

23.5.4.3.2 Multicast and unicast address resolution

The hash table algorithm used in the group and individual hash filtering operates as follows.

- The 48-bit destination address is mapped into one of 64 bits, represented by 64 bits in $\text{ENET}_n_GAUR/GALR$ (group address hash match) or $\text{ENET}_n_IAUR/IALR$ (individual address hash match).

- This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63.
- The msb of the CRC result selects ENET n _GAUR (msb = 1) or ENET n _GALR (msb = 0).
- The five lsbs of the hash result select the bit within the selected register.
- If the CRC generator selects a bit set in the hash table, the frame is accepted; else, it is rejected.

For example, if eight group addresses are stored in the hash table and random group addresses are received, the hash table prevents roughly 56/64 (or 87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The user must initialize the hash table registers. Use this CRC32 polynomial to compute the hash:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

If Promiscuous mode is enabled (ENET n _RCR[PROM] = 1) all unicast and multicast frames are accepted regardless of ENET n _GAUR/GALR and ENET n _IAUR/IALR settings.

23.5.4.3.3 Broadcast address reject

All broadcast frames are accepted if BC_REJ is cleared or ENET n _RCR[PROM] is set. If PROM is cleared when ENET n _RCR[BC_REJ] is set, all broadcast frames are rejected.

Table 23-77. Broadcast address reject programming

| PROM | BC_REJ | Broadcast frames |
|------|--------|------------------|
| 0 | 0 | Accepted |
| 0 | 1 | Rejected |
| 1 | 0 | Accepted |
| 1 | 1 | Accepted |

23.5.4.3.4 Miss-bit implementation

For higher layer filtering purposes, RxBD[M] indicates an address miss when the MAC operates in promiscuous mode and accepts a frame that would otherwise be rejected.

If a group/individual hash or exact match does not occur and Promiscuous mode is enabled (RCR[PROM] = 1), the frame is accepted and the M bit is set in the buffer descriptor; otherwise, the frame is rejected.

This means the status bit is set in any of the following conditions during Promiscuous mode:

- A broadcast frame is received when BC_REJ is set
- A unicast is received that does not match either:
 - Node address (PALR[PADDR1] and PAUR[PADDR2])
 - Hash table for unicast (IAUR[IADDR1] and IALR[IADDR2])
- A multicast is received that does not match the GAUR[GADDR1] and GALR[GADDR2] hash table entries

23.5.4.4 Frame length/type verification: payload length check

If the length/type is less than 0x600 and NLC is set, the MAC checks the payload length and reports any error in the frame status word and interrupt bit PLR.

If the length/type is greater than or equal to 0x600, the MAC interprets the field as a type and no payload length check is performed.

The length check is performed on VLAN and stacked VLAN frames. If a padded frame is received, no length check can be performed due to the extended frame payload because padded frames can never have a payload length error.

23.5.4.5 Frame length/type verification: frame length check

When the receive frame length exceeds MAX_FL bytes, the BABR interrupt is generated and the RxBD[LG] bit is set.

The frame is not truncated unless the frame length exceeds the value programmed in ENET_n_FTRL[TRUNC_FL]. If the frame is truncated, RxBD[TR] is set. In addition, a truncated frame always has the CRC error indication set (RxBD[CR]).

23.5.4.6 VLAN frames processing

VLAN frames have a length/type field set to 0x8100 immediately followed by a 16-Bit VLAN control information field.

VLAN-tagged frames are received as normal frames because the VLAN tag is not interpreted by the MAC function, and are pushed complete with the VLAN tag to the user application. If the length/type field of the VLAN-tagged frame, which is found four octets later in the frame, is less than 42, the padding is removed. In addition, the frame status word (RxBD[NO]) indicates that the current frame is VLAN tagged.

23.5.4.7 Pause frame termination

The receive engine terminates pause frames and does not transfer them to the receive FIFO. The quanta is extracted and sent to the MAC transmit path via a small internal clock rate decoupling asynchronous FIFO.

The quanta is written only if a correct CRC and frame length are detected by the control state machine. If not, the quanta is discarded and the MAC transmit path is not paused.

Good pause frames are ignored if ENET n _RCR[FCE] is cleared and are forwarded to the client interface when ENET n _RCR[PAUFWD] is set.

23.5.4.8 CRC check

The CRC-32 field is checked and forwarded to the core FIFO interface if ENET n _RCR[CRCFWD] is cleared and ENET n _RCR[PADEN] is set.

When CRCFWD is set (regardless of PADEN), the CRC-32 field is checked and terminated (not transmitted to the FIFO).

The CRC polynomial, as specified in the 802.3 standard, is:

- $$\text{FCS}(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$$

The 32 bits of the CRC value are placed in the frame check sequence (FCS) field with the x^{31} term as right-most bit of the first octet. The CRC bits are thus received in the following order: $x^{31}, x^{30}, \dots, x^1, x^0$.

If a CRC error is detected, the frame is marked invalid and RxBD[CR] is set.

23.5.4.9 Frame padding removal

When a frame is received with a payload length field set to less than 46 (42 for VLAN-tagged frames and 38 for frames with stacked VLANs), the zero padding can be removed before the frame is written into the data FIFO depending on the setting of `ENET n _RCR[PADEN]`.

Note

If a frame is received with excess padding (in other words, the length field is set as mentioned above, but the frame has more than 64 octets) and padding removal is enabled, then the padding is removed as normal and no error is reported if the frame is otherwise correct (for example: good CRC, less than maximum length, and no other error).

23.5.5 MAC transmit

Frame transmission starts when the transmit FIFO holds enough data.

After a transfer starts, the MAC transmit function performs the following tasks:

- Generates preamble and SFD field before frame transmission
- Generates XOFF pause frames if the receive FIFO reports a congestion or if `ENET n _TCR[TFC_PAUSE]` is set with `ENET n _OPD[PAUSE_DUR]` set to a non-zero value
- Generates XON pause frames if the receive FIFO congestion condition is cleared or if `TFC_PAUSE` is set with `PAUSE_DUR` cleared
- Suspends Ethernet frame transfer (XOFF) if a non-zero pause quanta is received from the MAC receive path
- Adds padding to the frame if required
- Calculates and appends CRC-32 to the transmitted frame
- Sends the frame with correct inter-packet gap (IPG) (deferring)

When the MAC is configured to operate in half-duplex mode, the following additional tasks are performed:

- Collision detection
- Frame retransmit after back-off timer expires

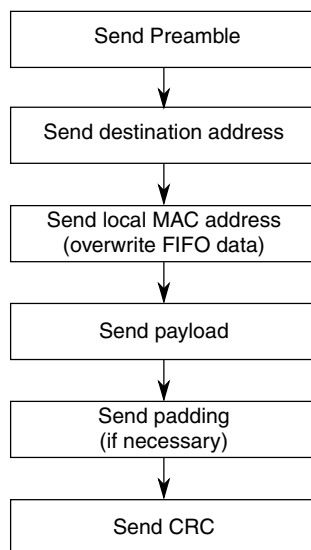

Figure 23-56. Frame transmit overview

23.5.5.1 Frame payload padding

The IEEE specification defines a minimum frame length of 64 bytes.

If the frame sent to the MAC from the user application has a size smaller than 60 bytes, the MAC automatically adds padding bytes (0x00) to comply with the Ethernet minimum frame length specification. Transmit padding is always performed and cannot be disabled.

If the MAC is not allowed to append a CRC ($\text{TxBD}[\text{TC}] = 1$), the user application is responsible for providing frames with a minimum length of 64 octets.

23.5.5.2 MAC address insertion

On each frame received from the core transmit FIFO interface, the source MAC address is either:

- Replaced by the address programmed in the PADDR1/2 fields ($\text{ENET}_n\text{TCR}[\text{ADDINS}] = 1$)
- Transparently forwarded to the Ethernet line ($\text{ENET}_n\text{TCR}[\text{ADDINS}] = 0$)

23.5.5.3 CRC-32 generation

The CRC-32 field is optionally generated and appended at the end of a frame.

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

The 32 bits of the CRC value are placed in the FCS field so that the x^{31} term is the right-most bit of the first octet. The CRC bits are thus transmitted in the following order: x^{31} , x^{30} , ..., x^1 , x^0 .

23.5.5.4 Inter-packet gap (IPG)

In full-duplex mode, after frame transmission and before transmission of a new frame, an IPG (programmed in `ENETn_TIPG`) is maintained. The minimum IPG can be programmed between 8 and 27 byte-times (64 and 216 bit-times).

In half-duplex mode, the core constantly monitors the line. Actual transmission of the data onto the network occurs only if it has been idle for a 96-bit time period, and any back-off time requirements have been satisfied. In accordance with the standard, the core begins to measure the IPG from CRS/GMII_CRS de-assertion.

23.5.5.5 Collision detection and handling — half-duplex operation only

A collision occurs on a half-duplex network when concurrent transmissions from two or more nodes take place. During transmission, the core monitors the line condition and detects a collision when the PHY device asserts COL.

When the core detects a collision while transmitting, it stops transmission of the data and transmits a 32-bit jam pattern. If the collision is detected during the preamble or the SFD transmission, the jam pattern is transmitted after completing the SFD, which results in a minimum 96-bit fragment. The jam pattern is a fixed pattern that is not compared to the actual frame CRC, and has a very low probability (0.532) of having a jam pattern identical to the CRC.

If a collision occurs before transmission of 64 bytes (including preamble and SFD), the MAC core waits for the backoff period and retransmits the packet data (stored in a 64-byte re-transmit buffer) that has already been sent on the line. The backoff period is generated from a pseudo-random process (truncated binary exponential backoff).

If a collision occurs after transmission of 64 bytes (including preamble and SFD), the MAC discards the remainder of the frame, optionally sets the LC interrupt bit, and sets TxBD[LCE].

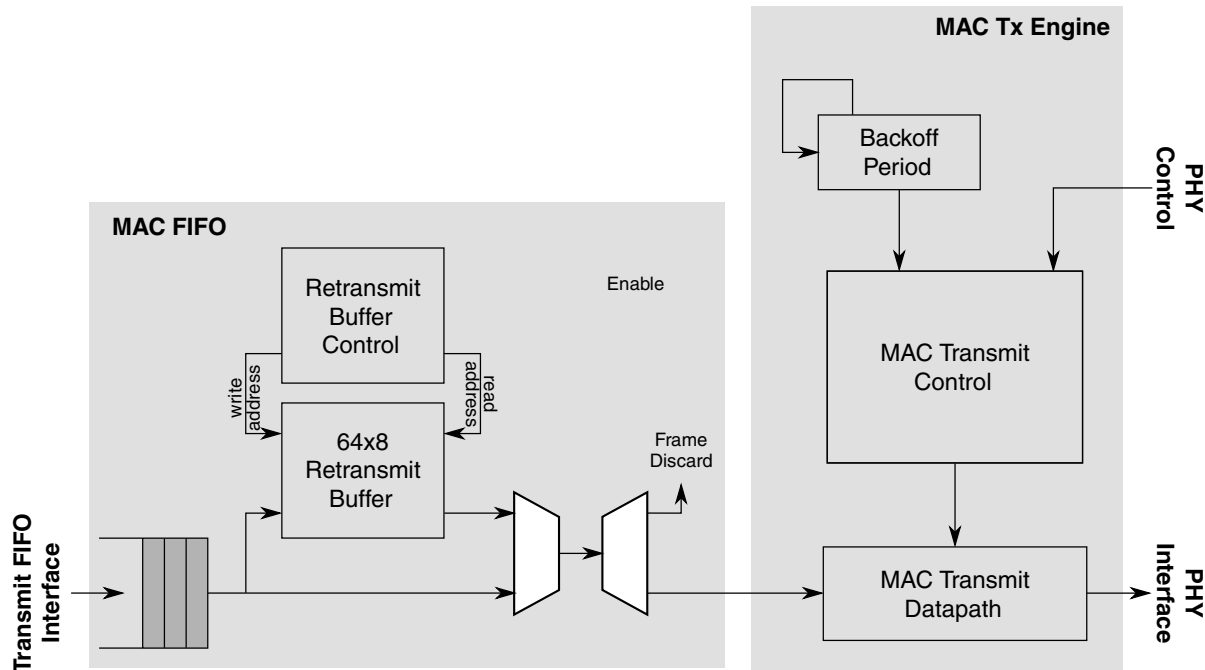

Figure 23-57. Packet re-transmit overview

The backoff time is represented by an integer multiple of slot times. One slot is equal to a 512-bit time period. The number of the delay slot times, before the n^{th} re-transmission attempt, is chosen as a uniformly-distributed random integer in the range:

- $0 < r < 2^k$
- $k = \min(n, N)$; where n is the number of retransmissions and $N = 10$

For example, after the first collision, the backoff period is 0 or 1 slot time. If a collision occurs on the first retransmission, the backoff period is 0, 1, 2, or 3, and so on.

The maximum backoff time (in 512-bit time slots) is limited by $N = 10$ as specified in the IEEE 802.3 standard.

If a collision occurs after 16 consecutive retransmissions, the core reports an excessive collision condition (ENET $_n$ _EIR[RL] interrupt field and TxBD[EE]) and discards the current packet from the FIFO.

In networks violating the standard requirements, a collision may occur after transmission of the first 64 bytes. In this case, the core stops the current packet transmission and discards the rest of the packet from the transmit FIFO. The core resumes transmission with the next packet available in the core transmit FIFO.

23.5.6 Full-duplex flow control operation

Three conditions are handled by the core's flow control engine:

- Remote device congestion — The remote device connected to the same Ethernet segment as the core reports congestion and requests that the core stop sending data.
- Core FIFO congestion — When the core's receive FIFO reaches a user-programmable threshold (RX section empty), the core sends a pause frame back to the remote device requesting the data transfer to stop.
- Local device congestion — Any device connected to the core can request (typically, via the host processor) the remote device to stop transmitting data.

23.5.6.1 Remote device congestion

When the MAC transmit control gets a valid pause quanta from the receive path and if `ENETn_RCR[FCE]` is set, the MAC transmit logic:

- Completes the transfer of the current frame.
- Stops sending data for the amount of time specified by the pause quanta in 512 bit time increments.
- Sets `ENETn_TCR[RFC_PAUSE]`.

Frame transfer resumes when the time specified by the quanta expires and if no new quanta value is received, or if a new pause frame with a quanta value set to 0x0000 is received. The MAC also resets `RFC_PAUSE` to zero.

If `ENETn_RCR[FCE]` cleared, the MAC ignores received pause frames.

Optionally and independent of `ENETn_RCR[FCE]`, pause frames are forwarded to the client interface if `PAUFWD` is set.

23.5.6.2 Local device/FIFO congestion

The MAC transmit engine generates pause frames when the local receive FIFO is not able to receive more than a pre-defined number of words (FIFO programmable threshold) or when pause frame generation is requested by the local host processor.

- To generate a pause frame, the host processor sets ENET n _TCR[TFC_PAUSE]. A single pause frame is generated when the current frame transfer is completed and TFC_PAUSE is automatically cleared. Optionally, an interrupt is generated.
- An XOFF pause frame is generated when the receive FIFO asserts its section empty flag (internal). An XOFF pause frame is generated automatically, when the current frame transfer completes.
- An XON pause frame is generated when the receive FIFO deasserts its section empty flag (internal). An XON pause frame is generated automatically, when the current frame transfer completes.

When an XOFF pause frame is generated, the pause quanta (payload byte P1 and P2) is filled with the value programmed in ENET n _OPD[PAUSE_DUR].

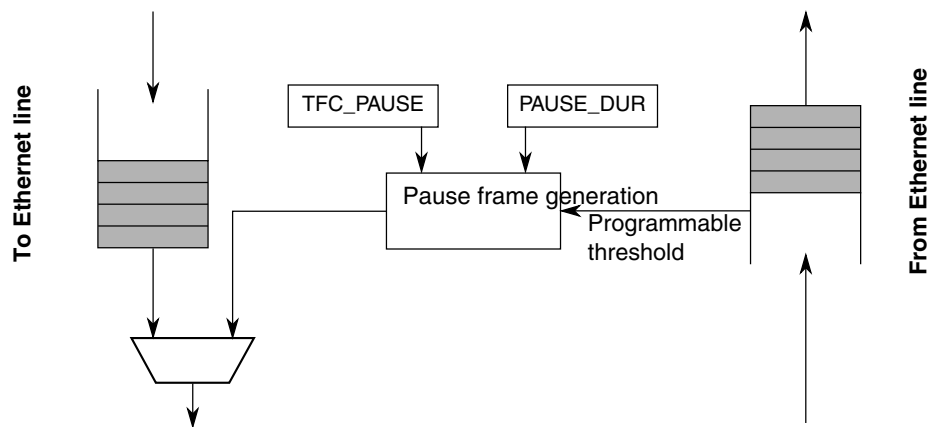

Figure 23-58. Pause frame generation overview

Note

Although the flow control mechanism should prevent any FIFO overflow on the MAC core receive path, the core receive FIFO is protected. When an overflow is detected on the receive FIFO, the current frame is truncated with an error indication set in the frame status word. The frame should subsequently be discarded by the user application.

23.5.7 Magic packet detection

Magic packet detection wakes a node that is put in power-down mode by the node management agent. Magic packet detection is supported only if the MAC is configured in sleep mode.

23.5.7.1 Sleep mode

To put the MAC in Sleep mode, set `ENETn_ECR[SLEEP]`. At the same time `ENETn_ECR[MAGICEN]` should also be set to enable magic packet detection.

In addition, when the processor is in Stop mode, Sleep mode is entered, without affecting the `ENETn_ECR` register bits.

When the core is in Sleep mode:

- The MAC transmit logic is disabled.
- The core FIFO receive/transmit functions are disabled.
- The MAC receive logic is kept in Normal mode, but it ignores all traffic from the line except magic packets. They are detected so that a remote agent can wake the node.

23.5.7.2 Magic packet detection

The core is designed to detect magic packets (see [Magic packets](#)) with the destination address set to:

- Any multicast address
- The broadcast address
- The unicast address programmed in `PADDR1/2`

When a magic packet is detected, `EIR[WAKEUP]` is set and none of the statistic registers are incremented.

23.5.7.3 Wakeup

When a magic packet is detected, indicated by `ENETn_EIR[WAKEUP]`, `ENETn_ECR[SLEEP]` should be cleared to resume normal operation of the MAC. Clearing the SLEEP bit automatically masks `ENETn_ECR[MAGICEN]`, disabling magic packet detection.

23.5.8 IP accelerator functions

The following sections describe the IP accelerator functions.

23.5.8.1 Checksum calculation

The IP and ICMP, TCP, UDP checksums are calculated with one's complement arithmetic summing up 16-bit values.

- For ICMP, the checksum is calculated over the complete ICMP datagram, in other words without IP header.
- For TCP and UDP, the checksums contain the header and data sections and values from the IP header, which can be seen as a pseudo-header that is not actually present in the data stream.

Table 23-78. IPv4 pseudo-header for checksum calculation

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|----------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Source address | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Destination address | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Zero | | | | | | | | Protocol | | | | | | | | TCP/UDP length | | | | | | | | | | | | | | | |

Table 23-79. IPv6 pseudo-header for checksum calculation

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Source address | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Destination address | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| TCP/UDP length | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Zero | | | | | | | | | | | | | | | | | | | | | | | | Next header | | | | | | | |

The TCP/UDP length value is the length of the TCP or UDP datagram, which is equal to the payload of an IP datagram. It is derived by subtracting the IP header length from the complete IP datagram length that is given in the IP header (IPv4), or directly taken from the IP header (IPv6). The protocol field is the corresponding value from the IP header. The Zero fields are all zeroes.

For IPv6, the complete 128-bit addresses are considered. The next header value identifies the upper layer protocol as either TCP or UDP. It may differ from the next header value of the IPv6 header if extension headers are inserted before the protocol header.

The checksum calculation uses 16-bit words in network byte order: The first byte sent/received is the MSB, and the second byte sent/received is the LSB of the 16-bit value to add to the checksum. If the frame ends on an odd number of bytes, a zero byte is appended for checksum calculation only, and is not actually transmitted.

23.5.8.2 Additional padding processing

According to IEEE 802.3, any Ethernet frame must have a minimum length of 64 octets.

The MAC usually removes padding on receive when a frame with length information is received. Because IP frames have a type value instead of length, the MAC does not remove padding for short IP frames, as it is not aware of the frame contents.

The IP accelerator function can be configured to remove the Ethernet padding bytes that might follow the IP datagram.

On transmit, the MAC automatically adds padding as necessary to fill any frame to a 64-byte length.

23.5.8.3 32-bit Ethernet payload alignment

The data FIFOs allow inserting two additional arbitrary bytes in front of a frame. This extends the 14-byte Ethernet header to a 16-byte header, which leads to alignment of the Ethernet payload, following the Ethernet header, on a 32-bit boundary.

This function can be enabled for transmit and receive independently with the corresponding SHIFT16 bits in the ENET $_n$ _TACC and ENET $_n$ _RACC registers.

When enabled, the valid frame data is arranged as shown in [Table 23-80](#).

Table 23-80. 64-bit interface data structure with SHIFT16 enabled

| | | | | | | | |
|---------|---------|---------|---------|--------|--------|-----------|-----------|
| 63 56 | 55 48 | 47 40 | 39 32 | 31 24 | 23 16 | 15 8 | 7 0 |
| Byte 5 | Byte 4 | Byte 3 | Byte 2 | Byte 1 | Byte 0 | Any value | Any value |
| Byte 13 | Byte 12 | Byte 11 | Byte 10 | Byte 9 | Byte 8 | Byte 7 | Byte 6 |
| ... | | | | | | | |

23.5.8.3.1 Receive processing

When ENET $_n$ _RACC[SHIFT16] is set, each frame is received with two additional bytes in front of the frame.

The user application must ignore these first two bytes and find the first byte of the frame in bits 23–16 of the first word from the RX FIFO.

Note

SHIFT16 must be set during initialization and kept set during the complete operation, because it influences the FIFO write behavior.

23.5.8.3.2 Transmit processing

When `ENETn_TACC[SHIFT16]` is set, the first two bytes of the first word written (bits 15–0) are discarded immediately by the FIFO write logic.

The SHIFT16 bit can be enabled/disabled for each frame individually if required, but can be changed only between frames.

23.5.8.4 Received frame discard

Because the receive FIFO must be operated in store and forward mode (`ENETn_RSFL` cleared), received frames can be discarded based on the following errors:

- The MAC function receives the frame with an error:
 - The frame has an invalid payload length
 - Frame length is greater than `MAX_FL`
 - Frame received with a CRC-32 error
 - Frame truncated due to receive FIFO overflow
 - Frame is corrupted as PHY signaled an error (`RX_ERR` asserted during reception)
- An IP frame is detected and the IP header checksum is wrong
- An IP frame with a valid IP header and a valid IP header checksum is detected, the protocol is known but the protocol-specific checksum is wrong

If one of the errors occurs and the IP accelerator function is configured to discard frames (`ENETn_RACC`), the frame is automatically discarded. Statistics are maintained normally and are not affected by this discard function.

23.5.8.5 IPv4 fragments

When an IPv4 IP fragment frame is received, only the IP header is inspected and its checksum verified. 32-bit alignment operates the same way on fragments as it does on normal IP frames, as specified above.

The IP fragment frame payload is not inspected for any protocol headers. As such, a protocol header would only exist in the very first fragment. To assist in protocol-specific checksum verification, the one's-complement sum is calculated on the IP payload (all bytes following the IP header) and provided with the frame status word.

The frame fragment status field (RxBD[FRAG]) is set to indicate a fragment reception, and the one's-complement sum of the IP payload is available in RxBD[Payload checksum].

Note

After all fragments have been received and reassembled, the application software can take advantage of the payload checksum delivered with the frame's status word to calculate the protocol-specific checksum of the datagram.

For example, if a TCP payload is delivered by multiple IP fragments, the application software can calculate the pseudo-header checksum value from the first fragment, and add the payload checksums delivered with the status for all fragments to verify the TCP datagram checksum.

23.5.8.6 IPv6 support

The following sections describe the IPv6 support.

23.5.8.6.1 Receive processing

An Ethernet frame of type 0x86DD identifies an IP Version 6 frame (IPv6) frame. If an IPv6 frame is received, the first IP header is inspected (first ten words), which is available in every IPv6 frame.

If the receive SHIFT16 function is enabled, the IP header is aligned on a 32-bit boundary allowing more efficient processing (see [32-bit Ethernet payload alignment](#)).

For TCP and UDP datagrams, the pseudo-header checksum calculation is performed and verified.

To assist in protocol-specific checksum verification, the one's-complement sum is always calculated on the IP payload (all bytes following the IP header) and provided with the frame status word. For example, if extension headers were present, their sums can be subtracted in software from the checksum to isolate the TCP/UDP datagram checksum, if required.

23.5.8.6.2 Transmit processing

For IPv6 transmission, the SHIFT16 function is supported to process 32-bit aligned datagrams.

IPv6 has no IP header checksum; therefore, the IP checksum insertion configuration is ignored.

The protocol checksum is inserted only if the next header of the IP header is a known protocol (TCP, UDP, or ICMP). If a known protocol is detected, the checksum over all bytes following the IP header is calculated and inserted in the correct position.

The pseudo-header checksum calculation is performed for TCP and UDP datagrams accordingly.

23.5.9 Resets and stop controls

The following sections describe the resets and stop controls.

23.5.9.1 Hardware reset

To reset the Ethernet module, set ENET n _ECR[RESET].

23.5.9.2 Soft reset

When ENET n _ECR[ETHER_EN] is cleared during operation, the following occurs:

- DMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.
- A currently ongoing transmit is terminated by asserting GMII/TXER to the PHY.

- A currently ongoing transmit FIFO write from the application is terminated by stopping the write to the FIFO, and all further data from the application is ignored. All subsequent writes are ignored until re-enabled.
- A currently ongoing receive FIFO read is terminated. The RxBD has arbitrary values in this case.

23.5.9.3 Hardware freeze

When the processor enters debug mode and ECR[DBGEN] is set, the MAC enters a freeze state where it stops all transmit and receive activities gracefully.

The following happens when the MAC enters hardware freeze:

- A currently ongoing receive transaction on the receive application interface is completed as normal. No further frames are read from the FIFO.
- A currently ongoing transmit transaction on the transmit application interface is completed as normal (in other words, until writing end-of-packet (EOP)).
- A currently ongoing frame receive is completed normally, after which no further frames are accepted from the MII/GMII.
- A currently ongoing frame transmit is completed normally, after which no further frames are transmitted.

23.5.9.4 Graceful stop

During a graceful stop, any currently ongoing transactions are completed normally and no further frames are accepted. The MAC can resume from a graceful stop without the need for a reset (for example, clearing ETHER_EN is not required).

The following conditions lead to a graceful stop of the MAC transmit or receive datapaths.

23.5.9.4.1 Graceful transmit stop (GTS)

When gracefully stopped, the MAC is no longer reading frame data from the transmit FIFO and has completed any ongoing transmission.

In any of the following conditions, the transmit datapath stops after an ongoing frame transmission has been completed normally.

- ENET n _TCR[GTS] is set by software.
- ENET n _TCR[TFC_PAUSE] is set by software requesting a pause frame transmission. The status (and register bit) is cleared after the pause frame has been sent.
- A pause frame was received stopping the transmitter. The stopped situation is terminated when the pause timer expires or a pause frame with zero quanta is received.
- MAC is placed in Sleep mode by software or the processor entering Stop mode (see [Sleep mode](#)).
- The MAC is in Hardware Freeze mode.

When the transmitter has reached its stopped state, the following events occur:

- The GRA interrupt is asserted, when transitioned into stopped.
- In Hardware Freeze mode, the GRA interrupt does not wait for the application write completion and asserts when the transmit state machine (in other words, line side of TX FIFO) reaches its stopped state.

23.5.9.4.2 Graceful receive stop (GRS)

When gracefully stopped, the MAC is no longer writing frames into the receive FIFO.

The receive datapath stops after any ongoing frame reception has been completed normally, if any of the following conditions occur:

- MAC is placed in Sleep mode either by the software or the processor is in Stop mode). The MAC continues to receive frames and search for magic packets if enabled (see [Magic packet detection](#)). However, no frames are written into the receive FIFO, and therefore are not forwarded to the application.
- The MAC is in Hardware Freeze mode. The MAC does not accept any frames from the MII/GMII.

When the receive datapath is stopped, the following events occur:

- If the RX is in the stopped state, RCR[GRS] is set

- The GRA interrupt is asserted when the transmitter and receiver are stopped
- Any ongoing receive transaction to the application (RX FIFO read) continues normally until the frame end of package (EOP) is reached. After this, the following occurs:
 - When Sleep mode is active, all further frames are discarded, flushing the RX FIFO
 - In Hardware Freeze mode, no further frames are delivered to the application and they stay in the receive FIFO.

Note

The assertion of GRS does not wait for an ongoing FIFO read transaction on the application side of the FIFO (FIFO read).

23.5.9.4.3 Graceful stop interrupt (GRA)

The graceful stopped interrupt (GRA) is asserted for the following conditions:

- In Sleep mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- In Hardware Freeze mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- The MAC transmit datapath is stopped for any other condition (GTS, TFC_PAUSE, pause received).

The GRA interrupt is triggered only once when the stopped state is entered. If the interrupt is cleared while the stop condition persists, no further interrupt is triggered.

23.5.10 IEEE 1588 functions

To allow for IEEE 1588 or similar time synchronization protocol implementations, the MAC is combined with a time-stamping module to support precise time-stamping of incoming and outgoing frames. Set `ENETn_ECR[1588EN]` to enable 1588 support.

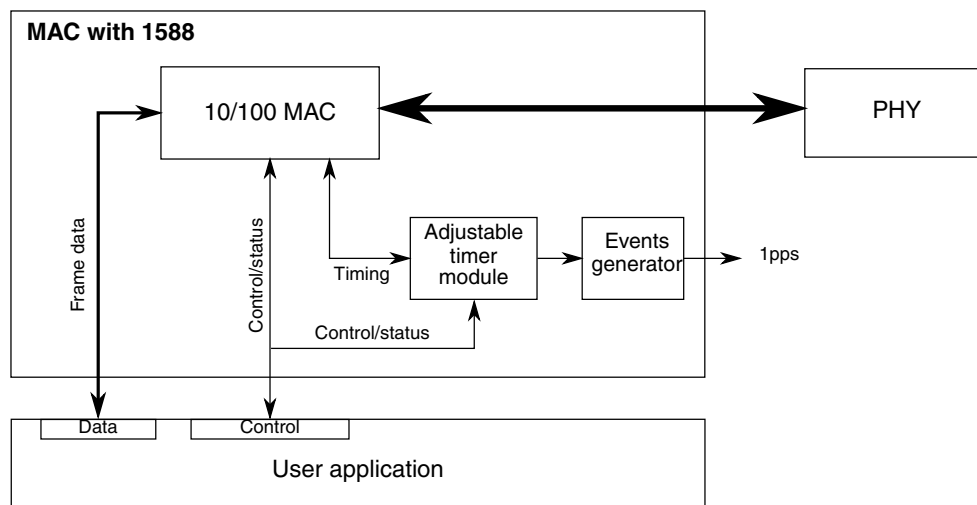

Figure 23-59. IEEE 1588 functions overview

23.5.10.1 Adjustable timer module

The adjustable timer module (TSM) implements the free-running counter (FRC), which generates the timestamps. The FRC operates with the time-stamping clock, which can be set to any value depending on your system requirements.

ENET time-stamp clock can be sourced either externally from `ENET_1588_CLKIN` PAD or from inner analog ENET PLL. However, choose a period that is an integer value (e.g. 5 ns, 6 ns, 8 ns) to implement a precise timer.

Through dedicated correction logic, the timer can be adjusted to allow synchronization to a remote master and provide a synchronized timing reference to the local system. The timer can be configured to cause an interrupt after a fixed time period, to allow synchronization of software timers or perform other synchronized system functions.

The timer is typically used to implement a period of one second; hence, its value ranges from 0 to $(1 \times 10^9) - 1$. The period event can trigger an interrupt, and software can maintain the seconds and hours time values as necessary.

23.5.10.1.1 Adjustable timer implementation

The adjustable timer consists of a programmable counter/accumulator and a correction counter. The periods of both counters and their increment rates are freely configurable, allowing very fine tuning of the timer.

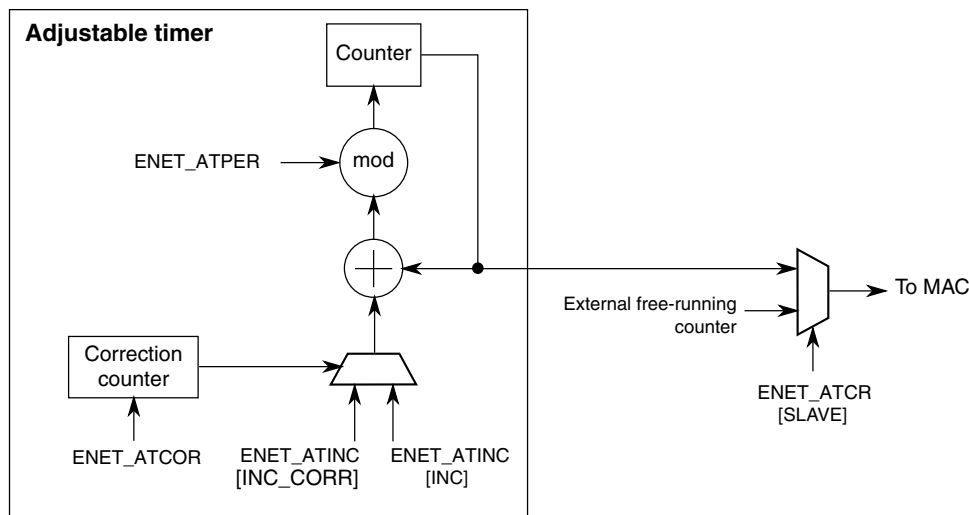

Figure 23-60. Adjustable timer implementation detail

The counter produces the current time. During each time-stamping clock cycle, a constant value is added to the current time as programmed in $\text{ENET}_n\text{_ATINC}$. The value depends on the chosen time-stamping clock frequency. For example, if it operates at 125 MHz, setting the increment to eight represents 8 ns.

The period, configured in $\text{ENET}_n\text{_ATPER}$, defines the modulo when the counter wraps. In a typical implementation, the period is set to 1×10^9 so that the counter wraps every second, and hence all timestamps represent the absolute nanoseconds within the one second period. When the period is reached, the counter wraps to start again respecting the period modulo. This means it does not necessarily start from zero, but instead the counter is loaded with the value $(\text{Current} + \text{Inc} - (1 \times 10^9))$, assuming the period is set to 1×10^9 .

The correction counter operates fully independently, and increments by one with each time-stamping clock cycle. When it reaches the value configured in $\text{ENET}_n\text{_ATCOR}$, it restarts and instructs the timer once to increment by the correction value, instead of the normal value.

The normal and correction increments are configured in $\text{ENET}_n\text{_ATINC}$. To speed up the timer, set the correction increment more than the normal increment value. To slow down the timer, set the correction increment less than the normal increment value.

The correction counter only defines the distance of the corrective actions, not the amount. This allows very fine corrections and low jitter (in the range of 1 ns) independent of the chosen clock frequency.

By enabling slave mode ($\text{ENET}_n\text{_ATCR}[\text{SLAVE}] = 1$), the timer is ignored and the current time is externally provided from one of the external modules. See the Chip Configuration details for which clock source is used. This is useful if multiple modules within the system must operate from a single timer. When slave mode is enabled, you still must set $\text{ENET}_n\text{_ATINC}[\text{INC}]$ to the value of the master, since it is used for internal comparisons.

23.5.10.2 Transmit timestamping

Only 1588 event frames need to be time-stamped on transmit. The client application (for example, the MAC driver) should detect 1588 event frames and set $\text{TxBD}[\text{TS}]$ together with the frame.

If $\text{TxBD}[\text{TS}]$ is set, the MAC records the timestamp for the frame in $\text{ENET}_n\text{_ATSTMP}$. $\text{ENET}_n\text{_EIR}[\text{TS_AVAIL}]$ is set to indicate that a new timestamp is available.

Software implements a handshaking procedure by setting $\text{TxBD}[\text{TS}]$ when it transmits the frame for which a timestamp is needed, and then waits for $\text{ENET}_n\text{_EIR}[\text{TS_AVAIL}]$ to determine when the timestamp is available. The timestamp is then read from $\text{ENET}_n\text{_ATSTMP}$. This is done for all event frames. Other frames do not use $\text{TxBD}[\text{TS}]$ and, therefore, do not interfere with the timestamp capture.

23.5.10.3 Receive timestamping

When a frame is received, the MAC latches the value of the timer when the frame's start of frame delimiter (SFD) field is detected, and provides the captured timestamp on $\text{RxBD}[1588 \text{ timestamp}]$. This is done for all received frames.

23.5.10.4 Time synchronization

The adjustable timer module is available to synchronize the local clock of a node to a remote master. It implements a free running 32-bit counter, and also contains an additional correction counter.

The correction counter increases or decreases the rate of the free running counter, enabling very fine granular changes of the timer for synchronization, yet adding only very low jitter when performing corrections.

The application software implements, in a slave scenario, the required control algorithm, setting the correction to compensate for local oscillator drifts and locking the timer to the remote master clock on the network.

The timer and all timestamp-related information should be configured to show the true nanoseconds value of a second (in other words, the timer is configured to have a period of one second). Hence, the values range from 0 to $(1 \times 10^9) - 1$. In this application, the seconds counter is implemented in software using an interrupt function that is executed when the nanoseconds counter wraps at 1×10^9 .

23.5.11 FIFO thresholds

The core FIFO thresholds are fully programmable to dynamically change the FIFO operation.

For example, store and forward transfer can be enabled by a simple change in the FIFO threshold registers.

The thresholds are defined in 64-bit words.

23.5.11.1 Receive FIFO

Four programmable thresholds are available, which can be set to any value to control the core operation as follows.

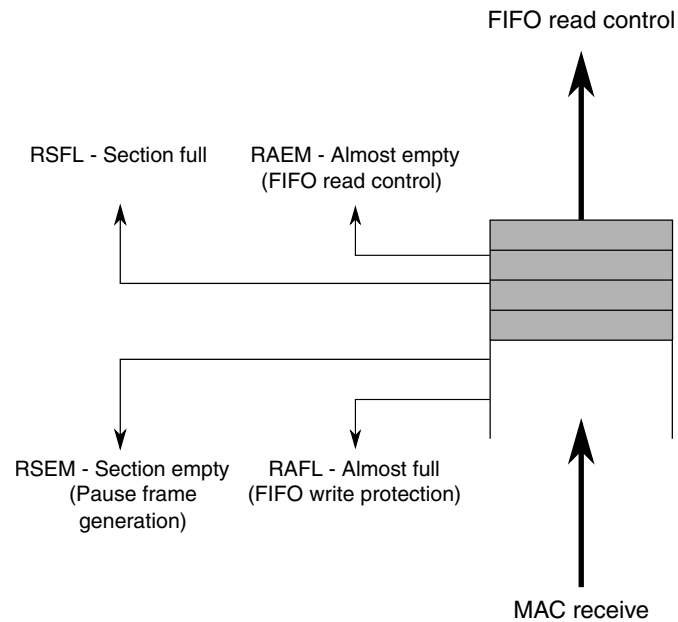

Table 23-81. Receive FIFO thresholds definition

| Register | Description |
|-------------------------------------|--|
| ENET n _RSFL [RX_SECTION_FULL] | <p>When the FIFO level reaches the ENETn_RSFL value, the MAC status signal is asserted to indicate that data is available in the receive FIFO (cut-through operation). Once asserted, if the FIFO empties below the threshold set with ENETn_RAEM and if the end-of-frame is not yet stored in the FIFO, the status signal is deasserted again.</p> <p>If a frame has a size smaller than the threshold (in other words, an end-of-frame is available for the frame), the status is also asserted.</p> <p>To enable store and forward on the receive path, clear ENETn_RSFL. The MAC status signal is asserted only when a complete frame is stored in the receive FIFO.</p> <p>When programming a non-zero value to ENETn_RSFL (cut-through operation) it should be greater than ENETn_RAEM.</p> |
| ENET n _RAEM [RX_ALMOST_EMPTY] | <p>When the FIFO level reaches the ENETn_RAEM value, and the end-of-frame has not been received, the core receive read control stops the FIFO read (and subsequently stops transferring data to the MAC client application).</p> <p>It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO.</p> <p>Set ENETn_RAEM to a minimum of six.</p> |

Table continues on the next page...

Table 23-81. Receive FIFO thresholds definition (continued)

| Register | Description |
|--------------------------------------|---|
| ENET n _RAFL [RX_ALMOST_FULL] | <p>When the FIFO level approaches the maximum and there is no more space remaining for at least ENETn_RAFL number of words, the MAC control logic stops writing data in the FIFO and truncates the receive frame to avoid FIFO overflow.</p> <p>The corresponding error status is set when the frame is delivered to the application.</p> <p>Set ENETn_RAFL to a minimum of 4.</p> |
| ENET n _RSEM [RX_SECTION_EMPTY] | <p>When the FIFO level reaches the ENETn_RSEM value, an indication is sent to the MAC transmit logic, which generates an XOFF pause frame. This indicates FIFO congestion to the remote Ethernet client.</p> <p>When the FIFO level goes below the value programmed in ENETn_RSEM, an indication is sent to the MAC transmit logic, which generates an XON pause frame. This indicates the FIFO congestion is cleared to the remote Ethernet client.</p> <p>Clearing ENETn_RSEM disables any pause frame generation.</p> |

**Figure 23-61. Receive FIFO overview**

23.5.11.2 Transmit FIFO

Four programmable thresholds are available which control the core operation as described below.

Table 23-82. Transmit FIFO thresholds definition

| Register | Description |
|--|--|
| ENET n _TAEM [TX_ALMOST _EMPTY] | <p>When the FIFO level reaches the ENETn_TAEM value and no end-of-frame is available for the frame, the MAC transmit logic avoids a FIFO underflow by stopping FIFO reads and transmitting the Ethernet frame with an MII error indication.</p> <p>Set ENETn_TAEM to a minimum of 4.</p> |
| ENET n _TAFL [TX_ALMOST _FULL] | <p>When the FIFO level approaches the maximum, so that there is no more space for at least ENETn_TAFL number of words, the MAC deasserts its control signal to the application.</p> <p>If the application does not react on this signal, the FIFO write control logic avoids FIFO overflow by truncating the current frame and setting the error status. As a result, the frame is transmitted with an GMII/MII error indication.</p> <p>Set ENETn_TAFL to a minimum of 4. Larger values allow more latency for the application to react on the MAC control signal deassertion, before the frame is truncated. A typical setting is 8, which offers 3–4 clock cycles of latency to the application to react on the MAC control signal deassertion.</p> |
| ENET n _TSEM [TX_SECTION _EMPTY] | <p>When the FIFO level reaches the ENETn_TSEM value, a MAC status signal is deasserted to indicate that the transmit FIFO is getting full.</p> <p>This gives the application an indication to slow or stop its write transaction to avoid a buffer overflow.</p> <p>This is a pure indication function to the application. It has no effect within the MAC.</p> <p>When ENETn_TSEM is 0, the signal is never deasserted.</p> |
| ENET n _TFWR | <p>When the FIFO level reaches the ENETn_TFWR value and when STRFWD is cleared, the MAC transmit control logic starts frame transmission before the end-of-frame is available in the FIFO (cut-through operation).</p> <p>If a complete frame has a size smaller than the ENETn_TFWR threshold, the MAC also transmits the frame to the line.</p> <p>To enable store and forward on the transmit path, set STRFWD. In this case, the MAC starts to transmit data only when a complete frame is stored in the transmit FIFO.</p> |

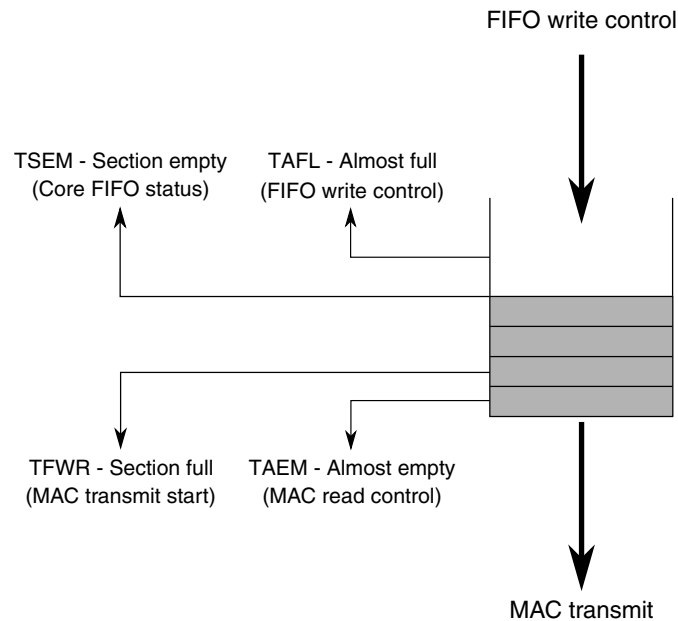

Figure 23-62. Transmit FIFO overview

23.5.12 Loopback options

The core implements external and internal loopback options, which are controlled by the ENET n _RCR register fields found here.

The core implements external and internal loopback options, which are controlled by the following ENET n _RCR register fields:

Table 23-83. Loopback options

| Register field | Description |
|----------------|---|
| LOOP | <p>Internal MII loopback. The MAC transmit is returned to the MAC receive. No data is transmitted to the external interfaces.</p> <p>In MII internal loopback, MII_TXCLK and MII_RXCLK must be provided with a clock signal (2.5 MHz for 10 Mbit/s, and 25 MHz for 100 Mbit/s))</p> |

Figure 23-63. Loopback options

23.5.13 Legacy buffer descriptors

To support the Ethernet controller on previous Freescale devices, legacy FEC buffer descriptors are available. To enable legacy support, clear ENETn_ECR[1588EN].

NOTE

Legacy buffer descriptors are used only in single-ring mode, that is, when DMA_nCFG[DMA_CLASS_EN] are zero.

23.5.13.1 Legacy receive buffer descriptor

The following figure shows the legacy FEC receive buffer descriptor. [Table 23-87](#) contains the descriptions for each field.

NOTE

The following addresses are shown for a big endian implementation.

Table 23-84. Legacy FEC receive buffer descriptor (RxB_D)

| | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Offset + 6 | Tx Data Buffer Pointer — low halfword | | | | | | | | | | | | | | | |

1. This field is not supported by the uDMA.

23.5.14 Enhanced buffer descriptors

This section provides a description of the enhanced operation of the driver/DMA via the buffer descriptors.

It is followed by a detailed description of the receive and transmit descriptor fields. To enable the enhanced features, set ENET n _ECR[1588EN].

23.5.14.1 Enhanced receive buffer descriptor

This section discusses the enhanced uDMA receive buffer descriptor.

NOTE

The following addresses are shown for a big endian implementation.

Table 23-86. Enhanced uDMA receive buffer descriptor (RxBD)

| | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Offset + 1C | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Offset + 1E | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

Table 23-87. Receive buffer descriptor field definitions

| Word | Field | Description |
|------------|-----------|---|
| Offset + 0 | 15 E | Empty. Written by the MAC (= 0) and user (= 1). 0 The data buffer associated with this BD is filled with received data, or data reception has aborted due to an error condition. The status and length fields have been updated as required. 1 The data buffer associated with this BD is empty, or reception is currently in progress. |
| Offset + 0 | 14 RO1 | Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware. |
| Offset + 0 | 13 W | Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location. 1 The next buffer descriptor is found at the location defined in ENET n _RDSR. |
| Offset + 0 | 12 RO2 | Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware. |
| Offset + 0 | 11 L | Last in frame. Written by the uDMA. 0 The buffer is not the last in a frame. 1 The buffer is the last in a frame. |
| Offset + 0 | 10–9 | Reserved, must be cleared. |
| Offset + 0 | 8 M | Miss. Written by the MAC. This field is set by the MAC for frames accepted in promiscuous mode, but flagged as a miss by the internal address recognition. Therefore, while in promiscuous mode, you can use the this field to quickly determine whether the frame was destined to this station. This field is valid only if the L and PROM bits are set. 0 The frame was received because of an address recognition hit. 1 The frame was received because of promiscuous mode. The information needed for this field comes from the promiscuous_miss(ff_rx_err_stat[26]) sideband signal. |

Table continues on the next page...

Table 23-87. Receive buffer descriptor field definitions (continued)

| Word | Field | Description |
|------------|---------------------|---|
| Offset + 0 | 7 BC | Set if the DA is broadcast (FFFF_FFFF_FFFF). |
| Offset + 0 | 6 MC | Set if the DA is multicast and not BC. |
| Offset + 0 | 5 LG | Receive frame length violation. Written by the MAC. A frame length greater than RCR[MAX_FL] was recognized. This field is valid only if the L field is set. The receive data is not altered in any way unless the length exceeds TRUNC_FL bytes. |
| Offset + 0 | 4 NO | Receive non-octet aligned frame. Written by the MAC. A frame that contained a number of bits not divisible by 8 was received, and the CRC check that occurred at the preceding byte boundary generated an error or a PHY error occurred. This field is valid only if the L field is set. If this field is set, the CR field is not set. |
| Offset + 0 | 3 | Reserved, must be cleared. |
| Offset + 0 | 2 CR | Receive CRC or frame error. Written by the MAC. This frame contains a PHY or CRC error and is an integral number of octets in length. This field is valid only if the L field is set. |
| Offset + 0 | 1 OV | Overflow. Written by the MAC. A receive FIFO overrun occurred during frame reception. If this field is set, the other status fields, M, LG, NO, CR, and CL, lose their normal meaning and are zero. This field is valid only if the L field is set. |
| Offset + 0 | 0 TR | Set if the receive frame is truncated (frame length > TRUNC_FL). If the TR field is set, the frame must be discarded and the other error fields must be ignored because they may be incorrect. |
| Offset + 2 | 15–0 Data Length | Data length. Written by the MAC. Data length is the number of octets written by the MAC into this BD's data buffer if L is cleared (the value is equal to EMRBR), or the length of the frame including CRC if L is set. It is written by the MAC once as the BD is closed. |
| Offset + 4 | 15–0 high | Receive data buffer pointer, high halfword ¹ |
| Offset + 6 | 15–0 low | Receive data buffer pointer, low halfword |
| Offset + 8 | 15 ME | MAC error. This field is written by the uDMA. This field means that the frame stored in the system memory was received with an error (typically, a receive FIFO overflow). This field is only valid when the L field is set. |
| Offset + 8 | 14–11 | Reserved, must be cleared. |
| Offset + 8 | 10 PE | PHY Error. This field is written by the uDMA. Set to "1" when the frame was received with an Error character on the PHY interface. The frame is invalid. This field is valid only when the L field is set. |
| Offset + 8 | 9 CE | Collision. This field is written by the uDMA. Set when the frame was received with a collision detected during reception. The frame is invalid and sent to the user application. This field is valid only when the L field is set. |
| Offset + 8 | 8 UC | Unicast. This field is written by the uDMA, and means that the frame is unicast. This field is valid regardless of whether the L field is set. |
| Offset + 8 | 7 INT | Generate RXB/RXF interrupt. This field is set by the user to indicate that the uDMA is to generate an interrupt on the <i>dma_int_rxb</i> / <i>dma_int_rxfevent</i> . |
| Offset + 8 | 6–0 | Reserved, must be cleared. |

Table continues on the next page...

Table 23-87. Receive buffer descriptor field definitions (continued)

| Word | Field | Description |
|-------------|--------------------------|--|
| Offset + A | 15–6 | Reserved, must be cleared. |
| Offset + A | 5 ICE | IP header checksum error. This is an accelerator option. This field is written by the uDMA. Set when either a non-IP frame is received or the IP header checksum was invalid. An IP frame with less than 3 bytes of payload is considered to be an invalid IP frame. This field is only valid if the L field is set. |
| Offset + A | 4 PCR | Protocol checksum error. This is an accelerator option. This field is written by the uDMA. Set when the checksum of the protocol is invalid or an unknown protocol is found and checksumming could not be performed. This field is only valid if the L field is set. |
| Offset + A | 3 | Reserved, must be cleared. |
| Offset + A | 2 VLAN | VLAN. This is an accelerator option. This field is written by the uDMA. It means that the frame has a VLAN tag. This field is valid only if the L field is set. |
| Offset + A | 1 IPV6 | IPv6 Frame. This field is written by the uDMA. This field indicates that the frame has an IPv6 frame type. If this field is not set it means that an IPv4 or other protocol frame was received. This field is valid only if the L field is set. |
| Offset + A | 0 FRAG | IPv4 Fragment. This is an accelerator option. This field is written by the uDMA. It indicates that the frame is an IPv4 fragment frame. This field is only valid when the L field is set. |
| Offset + C | 15–11 Header length | Header length. This is an accelerator option. This field is written by the uDMA. This field is the sum of 32-bit words found within the IP and its following protocol headers. If an IP datagram with an unknown protocol is found, then the value is the length of the IP header. If no IP frame or an erroneous IP header is found, the value is 0. The following values are minimum values if no header options exist in the respective headers: <ul style="list-style-type: none"> • ICMP/IP: 6 (5 IP header, 1 ICMP header) • UDP/IP: 7 (5 IP header, 2 UDP header) • TCP/IP: 10 (5 IP header, 5 TCP header) This field is only valid if the L field is set. |
| Offset + C | 10–8 | Reserved, must be cleared. |
| Offset + C | 7–0 Protocol type | Protocol type. This is an accelerator option. The 8-bit protocol field found within the IP header of the frame. It is valid only when ICE is cleared. This field is valid only when the L field is set. |
| Offset + E | 15–0 Payload checksum | Internet payload checksum. This is an accelerator option. It is the one's complement sum of the payload section of the IP frame. The sum is calculated over all data following the IP header until the end of the IP payload. This field is valid only when the L field is set. |
| Offset + 10 | 15 BDU | Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1). |
| Offset + 10 | 14–0 | Reserved, must be cleared. |
| Offset + 12 | 15–0 | Reserved, must be cleared. |
| Offset + 14 | 15–0 | This value is written by the uDMA. It is only valid if the L field is set. |
| Offset + 16 | 1588 timestamp | |

Table continues on the next page...

Table 23-87. Receive buffer descriptor field definitions (continued)

| Word | Field | Description |
|-------------|-------|----------------------------|
| Offset + 18 | 15–0 | Reserved, must be cleared. |
| – | | |
| Offset + 1E | | |

1. The receive buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 16. The buffer must reside in memory external to the MAC. The Ethernet controller never modifies this value.

23.5.14.2 Enhanced transmit buffer descriptor

This section discusses the enhanced uDMA transmit buffer descriptor.

NOTE

The following addresses are shown for a big endian implementation.

Table 23-88. Enhanced transmit buffer descriptor (TxBD)

| | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Offset + 16 | 1588 timestamp – low halfword | | | | | | | | | | | | | | | |
| Offset + 18 | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Offset + 1A | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Offset + 1C | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Offset + 1E | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

Table 23-89. Enhanced transmit buffer descriptor field definitions

| Word | Field | Description |
|------------|---------------------|---|
| Offset + 0 | 15 R | Ready. Written by the MAC and you. 0 The data buffer associated with this BD is not ready for transmission. You are free to manipulate this BD or its associated data buffer. The MAC clears this field after the buffer has been transmitted or after an error condition is encountered. 1 The data buffer, prepared for transmission by you, has not been transmitted or currently transmits. You may write no fields of this BD after this field is set. |
| Offset + 0 | 14 TO1 | Transmit software ownership. This field is reserved for software use. This read/write field is not modified by hardware and its value does not affect hardware. |
| Offset + 0 | 13 W | Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location 1 The next buffer descriptor is found at the location defined in ETDSR. |
| Offset + 0 | 12 TO2 | Transmit software ownership. This field is reserved for use by software. This read/write field is not modified by hardware and its value does not affect hardware. |
| Offset + 0 | 11 L | Last in frame. Written by user. 0 The buffer is not the last in the transmit frame 1 The buffer is the last in the transmit frame |
| Offset + 0 | 10 TC | Transmit CRC. Written by user, and valid only when L is set. 0 End transmission immediately after the last data byte 1 Transmit the CRC sequence after the last data byte This field is valid only when the L field is set. |
| Offset + 0 | 9 ABC | Append bad CRC. Note: This field is not supported by the uDMA and is ignored. |
| Offset + 0 | 8–0 | Reserved, must be cleared. |
| Offset + 2 | 15–0 Data Length | Data length, written by user. Data length is the number of octets the MAC should transmit from this BD's data buffer. It is never modified by the MAC. |
| Offset + 4 | 15–0 high | Tx data buffer pointer, high halfword. The transmit buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 8. The buffer must reside in memory external to the MAC. This value is never modified by the Ethernet controller. |
| Offset + 6 | 15–0 low | Tx data buffer pointer, low halfword |
| Offset + 8 | 15 | Reserved, must be cleared. |
| Offset + 8 | 14 INT | Generate interrupt flags. This field is written by the user. This field is valid regardless of the L field and must be the same for all EBD for a given frame. The uDMA does not update this value. |
| Offset + 8 | 13 TS | Timestamp. This field is written by the user. This indicates that the uDMA is to generate a timestamp frame to the MAC. This field is valid regardless of the L field and must be the same for all EBD for the given frame. The uDMA does not update this value. |

Table continues on the next page...

Table 23-89. Enhanced transmit buffer descriptor field definitions (continued)

| Word | Field | Description |
|-------------------------|----------------|---|
| Offset + 8 | 12 PINS | Insert protocol specific checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the protocol checksum and overwrites the corresponding checksum field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame. |
| Offset + 8 | 11 IINS | Insert IP header checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the IP header checksum and overwrites the corresponding header field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame. |
| Offset + 8 | 10–0 | Reserved, must be cleared. |
| Offset + A | 15 TXE | Transmit error occurred. This field is written by the uDMA. This field indicates that there was a transmit error of some sort reported with the frame. Effectively this field is an OR of the other error fields including UE, EE, FE, LCE, OE, and TSE. This field is valid only when the L field is set. |
| Offset + A | 14 | Reserved, must be cleared. |
| Offset + A | 13 UE | Underflow error. This field is written by the uDMA. This field indicates that the MAC reported an underflow error on transmit. This field is valid only when the L field is set. |
| Offset + A | 12 EE | Excess Collision error. This field is written by the uDMA. This field indicates that the MAC reported an excess collision error on transmit. This field is valid only when the L field is set. |
| Offset + A | 11 FE | Frame with error. This field is written by the uDMA. This field indicates that the MAC reported that the uDMA reported an error when providing the packet. This field is valid only when the L field is set. |
| Offset + A | 10 LCE | Late collision error. This field is written by the uDMA. This field indicates that the MAC reported that there was a Late Collision on transmit. This field is valid only when the L field is set. |
| Offset + A | 9 OE | Overflow error. This field is written by the uDMA. This field indicates that the MAC reported that there was a FIFO overflow condition on transmit. This field is only valid when the L field is set. |
| Offset + A | 8 TSE | Timestamp error. This field is written by the uDMA. This field indicates that the MAC reported a different frame type then a timestamp frame. This field is valid only when the L field is set. |
| Offset + A | 7–0 | Reserved, must be cleared. |
| Offset + C | 15–0 | Reserved, must be cleared. |
| Offset + E | 15–0 | Reserved, must be cleared. |
| Offset + 10 | 15 BDU | Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1). |
| Offset + 10 | 14–0 | Reserved, must be cleared. |
| Offset + 12 | 15–0 | Reserved, must be cleared. |
| Offset + 14 | 1588 timestamp | This value is written by the uDMA . It is valid only when the L field is set. |
| Offset + 16 | | |
| Offset + 18–Offset + 1E | 15–0 | Reserved, must be cleared. |

23.5.15 Client FIFO application interface

The FIFO interface is completely asynchronous from the Ethernet line, and the transmit and receive interface can operate at a different clock rate.

All transfers to/from the user application are handled independently of the core operation, and the core provides a simple interface to user applications based on a two-signal handshake.

23.5.15.1 Data structure description

The data structure defined in the following tables for the FIFO interface must be respected to ensure proper data transmission on the Ethernet line. Byte 0 is sent to and received from the line first.

Table 23-90. FIFO interface data structure

| | 63 | 56 55 | 48 47 | 40 39 | 32 31 | 24 23 | 16 15 | 8 7 | 0 |
|--------|---------|---------|---------|---------|---------|---------|--------|--------|---|
| Word 0 | Byte 7 | Byte 6 | Byte 5 | Byte 4 | Byte 3 | Byte 2 | Byte 1 | Byte 0 | |
| Word 1 | Byte 15 | Byte 14 | Byte 13 | Byte 12 | Byte 11 | Byte 10 | Byte 9 | Byte 8 | |
| ... | ... | | | | | | | | |

The size of a frame on the FIFO interface may not be a modulo of 64-bit.

The user application may not care about the Ethernet frame formats in full detail. It needs to provide and receive an Ethernet frame with the following structure:

- Ethernet MAC destination address
- Ethernet MAC source address
- Optional 802.1q VLAN tag (VLAN type and info field)
- Ethernet length/type field
- Payload

Frames on the FIFO interface do not contain preamble and SFD fields, which are inserted and discarded by the MAC on transmit and receive, respectively.

- On receive, CRC and frame padding can be stripped or passed through transparently.
- On transmit, padding and CRC can be provided by the user application, or appended automatically by the MAC independently for each frame. No size restrictions apply.

Note

On transmit, if ENET n _TCR[ADDINS] is set, bytes 6–11 of each frame can be set to any value, since the MAC overwrites the bytes with the MAC address programmed in the ENET n _PAUR and ENET n _PALR registers.

Table 23-91. FIFO interface frame format

| Byte number | Field |
|-------------|-------------------------|
| 0–5 | Destination MAC address |
| 6–11 | Source MAC address |
| 12–13 | Length/type field |
| 14–N | Payload data |

VLAN-tagged frames are supported on both transmit and receive, and implement additional information (VLAN type and info).

Table 23-92. FIFO interface VLAN frame format

| Byte number | Field |
|-------------|-------------------------|
| 0–5 | Destination MAC address |
| 6–11 | Source MAC address |
| 12–15 | VLAN tag and info |
| 16–17 | Length/type field |
| 18–N | Payload data |

Note

The standard defines that the LSB of the MAC address is sent/received first, while for all the other header fields — in other words, length/type, VLAN tag, VLAN info, and pause quanta — the MSB is sent/received first.

23.5.15.2 Data structure examples

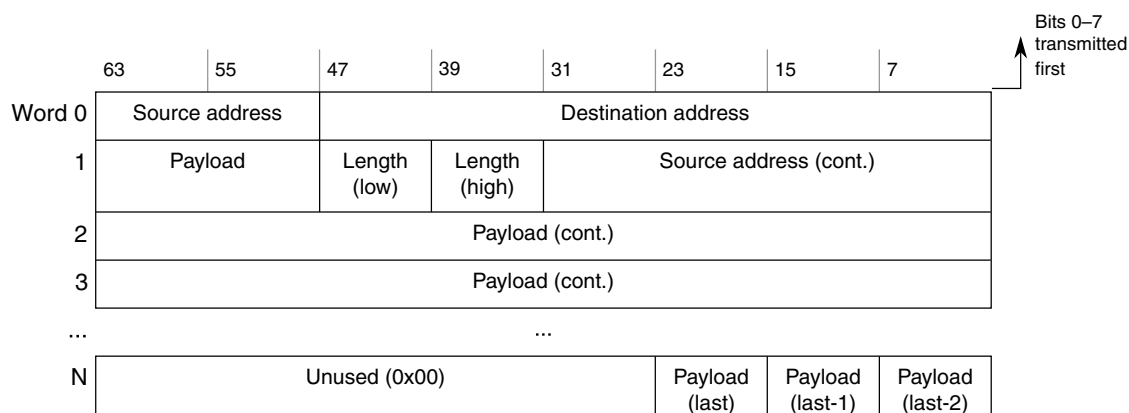

Figure 23-64. Normal Ethernet frame 64-bit mapping example

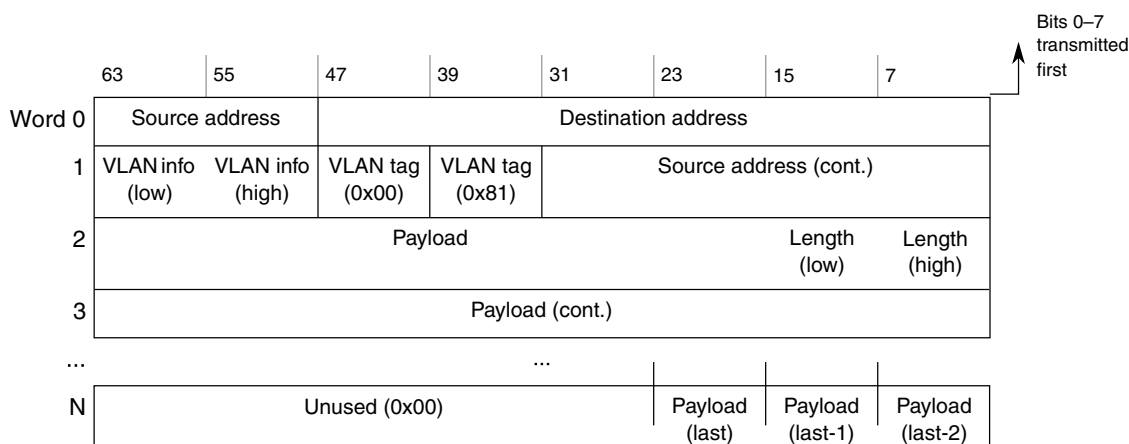

Figure 23-65. VLAN-tagged frame 64-bit mapping example

If CRC forwarding is enabled (CRCFWD = 0), the last four valid octets of the frame contain the FCS field. The non-significant bytes of the last word can have any value.

23.5.15.3 Frame status

A MAC layer status word and an accelerator status word is available in the receive buffer descriptor.

See [Enhanced buffer descriptors](#) for details.

The status is available with each frame with the last data of the frame.

If the frame status contains a MAC layer error (for example, CRC or length error), RxB[ME] is also set with the last data of the frame.

23.5.16 FIFO protection

The following sections describe the FIFO protection mechanisms.

23.5.16.1 Transmit FIFO underflow

During a frame transfer, when the transmit FIFO reaches the almost empty threshold with no end-of-frame indication stored in the FIFO, the MAC logic:

- Stops reading data from the FIFO
- Asserts the MII error signal (MII_TXER) (1 in [Figure 23-66](#)) to indicate that the fragment already transferred is not valid
- Deasserts the MII transmit enable signal (MII_TXEN) to terminate the frame transfer (2)

After an underflow, when the application completes the frame transfer (3), the MAC transmit logic discards any new data available in the FIFO until the end of packet is reached (4) and sets the enhanced TxBD[UE] field.

The MAC starts to transfer data on the MII interface when the application sends a new frame with a start of frame indication (5).

Figure 23-66. Transmit FIFO underflow protection

23.5.16.2 Transmit FIFO overflow

On the transmit path, when the FIFO reaches the programmable almost full threshold, the internal MAC ready signal is deasserted. The application should stop sending new data.

However, if the application keeps sending data, the transmit FIFO overflows, corrupting contents that were previously stored. The core logic sets the enhanced TxBD[OE] field for the next frame transmitted to indicate this overflow occurrence.

Note

Overflow is a fatal error and must be addressed by resetting the core or clearing ENET n _ECR[ETHER_EN], to clear the FIFOs and prepare for normal operation again.

23.5.16.3 Receive FIFO overflow

During a frame reception, if the client application is not able to receive data (1), the MAC receive control truncates the incoming frame when the FIFO reaches the programmable almost-full threshold to avoid an overflow.

The frame is subsequently received on the FIFO interface with an error indication (enhanced RxBD[ME] field set together with receive end-of-packet) (2) with the truncation error status field set (3).

Figure 23-67. Receive FIFO overflow protection

23.5.17 PHY management interface

The MDIO interface is a two-wire management interface. The MDIO management interface implements a standardized method to access the PHY device management registers.

The core implements a master MDIO interface, which can be connected to up to 32 PHY devices.

23.5.17.1 MDIO frame format

The core MDIO master controller communicates with the slave (PHY device) using frames that are defined in the following table.

A complete frame has a length of 64 bits made up of an optional 32-bit preamble, 14-bit command, 2-bit bus direction change, and 16-bit data. Each bit is transferred on the rising edge of the MDIO clock (MDC signal).

The core PHY management interface supports the standard MDIO specification (IEEE803.2 Clause 22).

Table 23-93. MDIO frame formats (read/write)

| Type | Command | | | | | TA | Data | | Idle |
|-------|---------|----|----|-------|-------|----|------------------|-----|------|
| | PRE | ST | OP | Addr1 | Addr2 | | MSB | LSB | |
| Read | 1...1 | 01 | 10 | xxxxx | xxxxx | Z0 | xxxxxxxxxxxxxxxx | | Z |
| Write | 1...1 | 01 | 01 | xxxxx | xxxxx | 10 | xxxxxxxxxxxxxxxx | | Z |

Table 23-94. MDIO frame field descriptions

| Field | Description |
|-------|---|
| PRE | Preamble. 32 bits of logical ones sent prior to every transaction when ENET _n _MSCR[DIS_PRE] is cleared. If DIS_PRE is set, the preamble is not generated. |
| ST | Start indication, programmed with ENET _n _MMFR[ST] <ul style="list-style-type: none"> Standard MDIO (Clause 22): 01 |
| OP | Opcode defines if a read or write operation is performed, programmed with ENET _n _MMFR[OP]. <p>01 Write operation</p> <p>10 Read operation</p> |
